Alto, the second voice of a male-voice church choir, *i.e.*, below treble and above tenor. The term may also be applied to an instrument to distinguish it from others of similar design but different register: *e.g.*, alto saxophone.

Alto-Relievo, a term applied to sculptured designs which are depicted in prominent relief on a flat surface, technically signifying that the projection exceeds one-half the true proportions of the objects represented. Basso-relievo is carving kept lower than one-half such proportionate projection.

Altruism, a term invented by Comte to denote devotion to the welfare of others, the opposite of Egoism.

Alum is a compound salt used in various industrial processes, especially dyeing, its constituents being the sulphate of one univalent metal or radical (*e.g.*, potassium, sodium, ammonium, rubidium, caesium, silver, thallium) and the sulphate of a tervalent metal (*e.g.*, aluminium, iron, chromium, manganese), and water of crystallisation.

Alumina is the oxide of aluminium. The ruby is almost 100 per cent. alumina; so also are the emerald, oriental amethyst, etc. Hydrated aluminium oxide is bauxite, chief ore of aluminium, from which the metal is extracted electrolytically.

Aluminium is a light metal which conducts electricity well. Its specific gravity at 20° C. is 2·705. Melting point of aluminium is 660·2° C. It is made commercially by electrolysing bauxite dissolved in cryolite (double fluoride of aluminium and sodium). Aluminium alloys because of their strength and lightness are being increasingly used for the construction of railway coaches, automobiles, aeroplanes, etc.

Amadavat, a popular cage bird of the weaver family, mainly crimson with white spots, so named because the first specimens came from Ahmadabad in India about 1700.

Amalgam is the term applied to any alloy of which mercury forms a part.

Amber, a brittle resinous substance; in origin, fossilised resin. Obtained mostly from the Baltic coasts, and used for ornaments, pipe mouth-pieces, etc.

Ambergris is a waxy substance produced in the intestines of the sperm whale, and generally found floating on the sea. Is a valuable perfumery material.

Amblycephalus, a genus of homoptera including the froth-fly, which is destructive in many hop gardens in July and August, sucking the sap from the vine.

Amblyopsis, a species of fish, practically sightless, and with inoperative organs of hearing and feeling, that inhabit the Mammoth Cave of Kentucky. A remarkable illustration of the failure of senses not brought into use.

America's Cup, a prize trophy first offered in 1851 by the Royal Yacht Squadron and open to yachts of all nations. It was won in the first year by the "America," a New York yacht, and has remained on that side of the ocean ever since, despite attempts to recapture it by Lord Dunraven, Sir Thomas Lipton, Mr. T. O. M. Sopwith, and others. Until Sept. 1957, when *Sceptre* of the Royal Yacht Squadron was beaten by *Columbia* of the New York Yacht Club, there had been no race since 1937.

Amethyst, the violet variety of quartz, used as a precious stone, containing traces of manganese, titanium, and iron. The finest coloured specimens come from Brazil and the Urals.

Amice, a linen vestment worn about the neck by Roman and many Anglican priests under the alb when officiating at Mass or Holy Eucharist. Formerly worn on the head by priests and pilgrims.

Amiens, Treaty of, signed by England, France, Spain, and Holland in 1802, brought the War of the French Revolution to an end. Fresh cause of quarrel was soon found, however, and Napoleon resumed the warfare, which only ended with Waterloo.

Amir (**Ameer** or **Emir**), is a title signifying head or chief, applied in Mahommedan countries to princes, chiefs, or rulers. The direct descendants of Mahomet's daughter Fatima were called Emirs. Chiefs of various tribes in Africa and the East have also assumed the title.

Ammeter, an instrument for measuring the current flowing in an electric circuit. A contraction of ampere-meter. (*See* **Ampere.**)

Ammonia, a colourless gaseous compound comprising three atoms of hydrogen to one of nitrogen. Formerly it was made by heating the horns and hoofs of deer, acquiring the name of spirits of hartshorn. The ammonia of commerce is now procured by coal decomposition in the course of gas-making and by direct synthesis. In the very important Haber process of ammonia production by fixation of atmospheric nitrogen, the nitrogen is made to combine with hydrogen and the ammonia so prepared is converted into nitric acid, ammonium nitrate or ammonium sulphate. The Haber process made Germany self-sufficient in nitrates in the first world war, and was afterwards exploited all over the world.

Ammonites, extinct animals related to the squid and the octopus. Many had beautiful coiled shells, and these fossils are found in the Mesozoic rocks, particularly the Lias.

Ammonium, the basic radical of ammonium salts. Composed of one atom of nitrogen and four of hydrogen, it behaves chemically like an atom of a monovalent alkali metal. Ammonium chloride is known as "sal ammoniac." "Sal volatile" is ammonium carbonate.

Amnesty, an act of grace by which a ruler or governing power pardons any body or political offenders. It is usually absolute; but it may be partial, as when it excepts certain specified persons from its operation.

Amœba, a microscopic unicellular animal, *see* **F23** (2).

Amorphous, a term used to indicate the absence of crystalline form in any body or substance.

Ampere, the most commonly used unit of electric current; often abbreviated to "amp." The international ampere is defined as that current which deposits silver at the rate of 0·001118 gram a second when passed through silver nitrate solution. *See* **N13** (**1**).

Amphibia, a class of vertebrate animals divided into four orders: *Caudata*, newts and salamanders; *Salientia*, frogs and toads; *Apoda*, the cæcilians which superficially resemble blue-

grey earthworms; *Stegocephalia*, fossil amphibians whose skeletons occur chiefly in the Carboniferous and Permian rocks. Most amphibians begin life as aquatic tadpoles breathing by gills, later metamorphose into four-legged lung-breathing animals living on land. Other characteristics of amphibia are: cold blood, skin without visible scales, skull articulates with the backbone by two knobs. In evolution the amphibia are intermediate between fish and reptiles. *See* **F24** (2).

Amphioxus *or* **Lancelet**, a primitive vertebrate occurring in sand-banks around British shores and elsewhere.

Amphitheatre, a term first used by the Romans to denote the buildings set apart for gladiatorial and wild beast exhibitions. The most notable was the Colosseum at Rome, part of the remains of which is still standing. There were numerous other amphitheatres in different parts of the Roman Empire, including two or three in Britain. *See* **G26** (1).

Amphora was a large clay vessel used by the Romans for preserving wine, fruit, oil, etc.

Ana, a collection of criticisms, observations, or opinions about a particular person, place or subject. Used as a suffix especially applies to a person's memorable sayings, anecdotes about or publications bearing on, as in *Johnsoniana, Alexandriana, Victoriana.*

Anabaptists, the name given to various Christian sects that came into prominence in Germany, Switzerland, and Holland during the Reformation. They rejected the baptism of infants as unscriptural and insisted on baptising afresh. They practised a primitive communism and regarded true religious reform as involving social reform. Their chief prophet, Thomas Münzer, was executed in 1525, and many of his followers were burnt at the stake. The later Anabaptists, persecuted by both Roman Catholics and Protestants, committed many acts of violence under the cloak of religious zeal, bringing discredit on the whole movement, which was gradually suppressed. The Mennonites (*q.v.*) were an offshoot of the Anabaptists.

Anabasis, Xenophon's narrative of the exploits of Cyrus the Younger against his brother Artaxerxes of Persia, 401 B.C. The title also of Arrian's history of Alexander the Great's expedition to Asia.

Anachronism, an erroneous reference to an event in respect of time, *e.g.*, the description of a railway train journey, say, in the 17th century.

Anagram is a literary exercise which consists in using the letters in a given word or phrase to form a different word or phrase.

Analogy, a method of argument whereby an inference is drawn from one set of facts and applied to another to which it has some resemblance.

Analysis is the process by which a complex thing is reduced or broken up into its original elements. Qualitative analysis reveals the presence of certain substances, quantitative analysis shows those substances in their respective proportions. Analysis as applied to Grammar, Mathematics, and Logic resolves phrases, propositions, and arguments into their separate parts.

Analysts, Public, are chemists appointed by local authorities under the Public Health Acts to analyse all such food and drugs as are submitted to them by inspectors within their own area. Every town of importance has its public analyst, whose work is to protect the public against food adulteration.

Anarchism is a revolutionary doctrine in opposition to all law and order as enforced by a government. The Greek word anarchy means no government, but in modern times it is regarded as a movement towards destroying the tyranny of the State and giving fuller play to natural economic forces and the principle of mutual aid. Proudhon (French) and Bakunin (Russian) were exponents of the philosophy.

Anathema was the Greek term for things dedicated to the gods, and in its modern religious use indicates unreserved offerings to God and sacrifice. The idea of destruction and perdition is a secondary meaning, and anathematisation in the Roman Church is the extreme form of excommunication.

Anchor, an instrument used for keeping ships stationary. Great improvements have been introduced in recent years, stockless anchors being now chiefly used, consisting of a shank and a loose fluke. Lloyds' rules prescribe the number and weight of anchors which must be carried by merchant ships.

Anchorite is a religious person who retires into solitude to employ himself with holy thoughts. Among the early Christians, anchorites were numerous, but in the Western Church they have been few. Their reputation for wisdom and prescience was high, and kings and rulers in old days would visit their cells for counsel. An anchorite or "ankret" was in mediæval times a source of fame and profit to the monastic house within which he was voluntarily immured.

Anchovy, a fish of the herring family, distinguished by its large mouth and projecting snout, plentiful in the Mediterranean and much esteemed when cured.

Ancient Lights are rights of light enjoyed by a property owner over adjoining land. Such a right is obtained either by uninterrupted enjoyment for twenty years, or by written authority, and once legally established cannot be upset, no building being permissible that would seriously interfere with the privilege.

Anemometer, an instrument for measuring the strength of the wind. In the most widely used pattern the rotation, about a vertical axis, of a group of hemispherical or conical cups gives a measure of the total flow of air past the cups, various registering devices being employed. The Dines anemograph provides a continuous record of the variation in both velocity and direction; changes of pressure produced in a horizontal tube, kept pointing into the wind by a vane, cause a float, to which a pen is attached, to rise and fall in sympathy with the gusts and lulls. The recently devised hot-wire anemometer, depending upon the change of electrical resistance experienced by a heated wire when cooled, enables very gentle air currents to be investigated.

Aneroid is the kind of barometer which does not depend upon atmospheric support of a mercury (or other liquid) column. It consists of a metallic box, partially exhausted of air, with a corrugated lid which moves with atmospheric changes. A lever system magnifies the lid movements about 200 times and atmospheric pressure is read from a dial. The construction of the vacuum chamber provides automatic compensation for temperature changes. An aneroid barometer is the basic component of an altimeter.

Angel, or **angel-noble**, an English gold coin which bore a representation of the archangel Michael in conflict with a dragon. The last English noble was coined in the reign of Charles I.

Angelica, an aromatic plant of the Umbelliferæ order, *Angelica officinalis*, valuable as a flavouring and possessing medicinal properties. In olden times supposed to ward off evil fortune.

Angels, divine messengers or agents communicating with or guarding human beings, a conception which is included in the Christian and other doctrines; and in former times, particularly in Western Christendom, special functions were accorded to certain angels and archangels, and their intercession was constantly appealed to.

Angelus, a church bell rung in Roman Catholic countries, at morn, noon, and sunset, to remind the faithful to say their Angelic Salutation.

Angevin Dynasty includes the Plantagenet kings from Henry II. to Richard II. The name was derived from Henry II.'s father, Geoffrey, Count of Anjou.

Angiosperms are plants whose seeds are contained in an ovary, as distinct from Gymnosperms, the seeds of which are naked. These two divisions make up the Phanerogams or Spermaphytes ("seed-bearing plants"). The Angiosperms are the true flowering plants, which number over 200,000 species. *See* **F29** (2).

Angle, a term used to denote the inclination to each other of two straight or curvilinear lines. Angles are measured by the degrees of the circumference of a circle, which is divided into 360 equal parts, the angles formed by the lines radiating from the centre being proportioned to the area of the circumference which the lines intercept. A right angle is one of 90°.

Angles, a northern tribe originally settled in

Schleswig, who with the Saxons and Jutes invaded Britain in the 5th century.

Anglican Communion comprises all the Churches in communion with the Church of England (*i.e.*, the ecclesiastical Provinces of Canterbury and York), including the Protestant Episcopal Church in the United States of America (8 Provinces). The Anglican Communion includes also the Church of Ireland (2 Provinces); the Church in Wales; the Episcopal Church in Scotland; the Church of India, Pakistan, Burma, and Ceylon; the Church of the Province of South Africa; the Church of England in Canada (4 Provinces); the Church of England in Australia and Tasmania (4 Provinces and 3 extra-Provincial Dioceses); the Church of the Province of New Zealand; the Church of the Province of the West Indies; the Chung Hua Sheng Kung Hui (Holy Catholic Church in China); the Nippon Sei Ko Kwai (Japan Holy Catholic Church); and the Church of the Prov. of W. Africa. All these Churches are completely autonomous save for the special provisions of the Establishment in England. In addition, there are some 21 separate dioceses scattered through the world, which are directly under the Archbishop of Canterbury. All the bishops of the Anglican Communion meet every ten years in the Lambeth Conference (last held in 1958), over which the Archbishop of Canterbury by custom presides as *primus inter pares*. The Conference has no legislative power, but in practice exercises enormous influence. In between these Conferences it is proposed to hold an Anglican Congress (including clergy and laity as well as bishops) and the first of these met in Minneapolis, Minnesota, in Aug. 1954.

Angstrom, a unit of length (formerly Angstrom unit) equal to one-hundredth of a millionth of a centimetre (10^{-8} cm.), used in measuring the wavelength of light, X-rays, etc.

Aniline, a well-known product derived from coal-tar. The name recalls the fact that it was first prepared by distilling indigo (*anil* is Portuguese for indigo). In 1856 W. H. Perkin (1838–1907) discovered the first aniline or coal-tar dye, mauve, and thus founded the modern dyestuff industry.

Animal Kingdom. The realm of living things is divided into the plant and animal kingdoms, whose members obtain energy by fundamentally different methods, although it is often difficult to say to which kingdom certain lowly organisms belong. The animal kingdom is itself divided into a number of major groups (phyla), the largest of which are: *Protozoa*, minute organisms with cellular organisation such as amœba; *Coelenterata*, including sea-anemones, jelly-fish, and corals; *Annelida*, of which the best-known example is the earthworm; *Arthropoda*, a very large group comprising insects, lobsters, spiders, etc.; *Mollusca*, including the snail, the oyster, the octopus, etc.; *Echinodermata*, starfish and sea-urchins; *Chordata*, animals possessing at some stage an organ called a notochord. The Chordata are further divided into two unequal groups: *Acraniata*, comprising such animals as the lancelet and the sea-squirt; *Craniata*, including all the animals usually known as "vertebrates" because they possess a backbone. All the other phyla, and the acraniata, may be grouped under the title "invertebrates." There are five classes of vertebrate animals: *Pisces*, fish: *Amphibia*, animals which, while breathing air, are not entirely independent of water—such as the frog; *Reptilia*, snakes, lizards, tortoises, etc.; *Aves*, birds; *Mammalia*, vertebrates which suckle their young. *See* **F23–25.**

Anise, an umbelliferous plant growing mostly in warm climates, and valued for its fruit, aniseed, possessing certain medicinal properties and yielding a volatile oil. Highly aromatic and used as a condiment for pickles and soups.

Anna, an Indian coin, one-sixteenth of a rupee.

Annals, or historical records, were kept by the Romans from an early period. In modern times the term is used to designate any general record of events arranged according to years.

Annates were acknowledgments formerly paid to the Pope by way of fee or tax in respect of ecclesiastical preferment, and consisted usually of a proportion of the income ("first-fruits") of the office. Introduced into England in the 13th century; annexed to the Crown under Henry VIII.; transferred to a perpetual fund for the benefit of the poorer clergy in 1704. (*See* **Queen Anne's Bounty.**)

"Annual Register," a yearly record of political and literary events, founded by Edmund Burke (as editor) in 1759 and Robert Dorsley, the bookseller.

Annunciation, Feast of the (March 25), is a church festival commemorating the message of the incarnation of Christ brought by the angel Gabriel to the Virgin Mary, hence the title Lady Day.

Anointing is the pouring of consecrated oil upon the body as a mark of supreme honour. In England it is restricted chiefly to the ceremony of the monarch's coronation, and the spoon with which the oil is applied forms part of the English regalia. In the Roman Catholic Church anointing represents the sacrament of extreme unction.

Ant. There are about 6,000 species of ants, which belong to the same order (Hymenoptera) as the bees, wasps, and ichneumon flies. They are social in habit, living in communities of varying size and development. There are three basic castes in ants—the females or *queens*, the *males*, and the *workers* (the last-named being neuter), although specialised forms of workers are sometimes found, *e.g.*, the *soldiers* of the harvesting ants. In the communities of those species of ants which evolved most recently there is a highly complex social life and well-developed division of labour. Some species of these ants make slaves of other species, stealing the cocoons before the adult forms emerge. Many ants "milk" greenflies, which they protect for their honey-like secretion, and most ants' nests contain many "guests," such as beetles and silver fish. Some ants harvest grains of corn, and others, from S. America, live on fungi which they cultivate in underground "mushroom beds."

Antarctic Exploration. In earlier centuries it was thought that a great continent must exist in the southern hemisphere, around the South Pole, to balance the known land masses in the north. Its supposed extent was greatly reduced in the 18th century, particularly when Capt. Cook sailed for the first time south of the Antarctic Circle and reached the edge of the ice pack. A portion of the ice-covered continent—the coast of Graham Land—was first sighted by Lieut. Edward Bransfield in 1820. Explorers of several other nations sighted portions of the coast-line in other quarters, but the first extensive exploration was made by Capt. James Clarke Ross, who with the *Erebus* and *Terror* penetrated into the Ross Sea in 1841, and discovered the great Ross Ice Barrier in 78° South lat. Interest in the Antarctic did not revive until after 1890, when an international scheme of research was drawn up. A Norwegian, C. E. Borchgrevink, in 1898–1900, was the first to winter in the Antarctic and to travel on the ice barrier. The British share in this work was carried out by Capt. R. F. Scott's expedition in the *Discovery*, 1901–4. Scott's party sledged across the barrier to 82° 17′ South, then a record "farthest south." A little later, Ernest Shackleton beat this by travelling to within 100 miles of the South Pole. In 1910 Scott organised his second expedition of the *Terra Nova*, and became engaged against his will in a "race for the Pole," when, after his departure, the Norwegian Arctic explorer, Roald Amundsen, suddenly announced that he was sailing for the Antarctic. Amundsen set up his base at the eastern end of the Barrier, and, relying on dog teams for hauling his sledges, reached the Pole on December 14, 1911. Meanwhile Scott and his party, their start delayed by adverse weather, were marching southwards, man-hauling their sledges, for Scott was against the use of dogs. After an arduous journey they reached the Pole one month after Amundsen. The return was a struggle against the weather and increasing weakness, probably due to scurvy, until at last they perished within a few miles of their base. After the First World War the development of the whaling industry greatly stimulated further exploration. Outstanding expeditions included that of Admiral R. E.

Byrd, 1929, when he flew over the South Pole; The British Graham Land expedition, 1934, which carried out the first extensive mapping of any part of the Antarctic continent; and the U.S. Navy's Antarctic Expedition of 1940, when the whole continent was circumnavigated and great areas photographed from the air. In recent years valuable work has been done by the first International expedition, the Norwegian–British–Swedish Expedition to Queen Maud Land, and by the French in Adélie Land. The Falkland Island Dependencies Survey, set up during the war, has continued the scientific exploration of Graham Land. The Antarctic was the scene of high adventure during the International Geophysical Year (1957–58), when scientists from many countries participated in the explorations. The Commonwealth Trans-Antarctic Expedition set out from opposite sides of the continent and met at the South Pole, the U.K. party, led by Sir Vivian Fuchs, from the Falklands, and Sir Edmund Hillary and his party from New Zealand. The U.K. party accomplished the first crossing of the White Continent in 99 days. Their scientific work included the making of seismic and complementary gravimetric studies at frequent intervals along the 2,200-mile traverse. Since the Antarctic is becoming important for many reasons, in weather forecasting, in the whaling industry, and as a possible centre for world air routes, the tempo of exploration and research will become even faster in the future. *See also* **C21** (1).

Anteater. There are two families of anteaters, the Myrmecophagidae and the Manidae. Among the former the Great Anteater (*Myrmecophaga jubita*) is the largest species, about 18 ft. in length, occurring in Central and S. America. Only half its size is the lesser Anteater (*Tamandua tetradactyla*); this is found in forests of tropical America and Trinidad. The Two-toed Anteater (*Cyclopes didactylus*) belongs to northern, South and Central America, and Trinidad. These three animals live almost entirely on ants; they are adapted to this diet, having large claws for digging out ants, and a tubular mouth with a long sticky tongue. The Manidae are the Scaly Anteaters or Pangolins, widely distributed over Africa and the Orient. The difference between the two families is that the first has hair covering the body, the latter has horny scales instead.

Antelope, a large zoological genus of mammalia, mainly deer-like and elegant animals, with lustrous eyes; fleet of foot, and widely distributed.

Antennæ, paired feelers of insects and crustaceans. In radio, the term "antenna" is equivalent to "aerial."

Anthem, a choral composition, with or without instrumental accompaniment, usually sung after the third collect in the Church of England service. The words are from the Scriptures, and the composition may be for solo voices only, for full choir, or for both. Among the chief British composers of anthems are Tallis, Purcell, Croft, Boyce, Goss, and Stainer.

Anthracite is the hardest kind of coal which burns with little smoke and is used for steam-raising as a domestic fuel; contains 90–94 per cent. carbon as against 75–90 per cent. in bituminous coals. Pennsylvania and S. Wales are the largest anthracite coal regions of the world.

Anthropoid, meaning "resembling man," is the term applied to apes whose structure has most similarity to that of man, in particular the apes belonging to the family Simiidæ, which includes the gibbon, chimpanzee, orang-utan, and gorilla.

Antiburghers, a Scottish sect which declined to take the oath required of burgesses in several towns. The Secession Church was split in 1747 and the antiburghers formed the "General Associate Synod," commonly called the Antiburgher Kirk. The abolition of the burgess oath led to a reunion in 1820 under the name of the "United Secession Church."

Anti-Christ, the enemy of Christ, by whom he is finally to be slain. Many legends connected with Anti-Christ were popular in the Middle Ages.

Anticyclone, a region where barometric pressure is greater than that of its surroundings. Such a system is distinguished on weather charts by a pattern of isobars, usually circular or oval-shaped, enclosing the centre of high pressure where the air is calm. In the remaining areas light or moderately strong winds blow spirally outwards, in a clockwise direction in the Northern Hemisphere (and in the reverse direction in the Southern Hemisphere), in accordance with Buy's Ballot's law (an observer with back to wind in Northern Hemisphere has lower pressure to left; in Southern to right). Over the British Isles anticyclonic weather is generally quiet and settled, being fair, warm, and sunny in summer and either very cold and often foggy or overcast and gloomy in winter. These systems move slowly and sometimes remain practically stationary for days at a time, that over Siberia being particularly well defined. Extensive belts of almost permanent anticyclones occur in latitudes 30° N. and 30° S.

Antilegomena, the books of the New Testament which were not accepted as canonical by the early Christian churches, though afterwards admitted to equal authority with the rest. These were: The Epistle to the Hebrews, the Epistle of St. James, the Second Epistle of St. Peter, the Second and Third Epistles of John, the Epistle of St. Jude, and the Apocalypse or Revelation of St. John.

Antimony, a crystalline metal of great brittleness. On being burned, it gives off dense fumes of oxide of antimony. By itself it is not of special utility; but as an alloy for hardening other metals, it is much used. As an alloy with lead for type-metal, and with tin and, copper or zinc for Britannia-metal, it is of great value. Most important antimony ore is stibnite (antimony sulphide).

Antinomian, name applied to one who believes that Christians are not bound to observe the "law of God" on the pretext that faith alone is sufficient to secure salvation. The term was first used during the Reformation by Luther.

Anti-Pope, one chosen by temporal authority in opposition to one canonically elected by the cardinals; commonly applied to the popes Urban VI. and Clement VII., who resided at Avignon during the Great Schism (1378–1417).

Anti-proton, the "negative proton," an atomic particle created in high energy collisions of nuclear particles. Its existence was confirmed in Oct. 1955. *See* **F12** (1), **13**.

Anti-Semitism. The persecution of the Jews had its origin at the beginning of the Christian era, and was, until the 19th century, largely conditioned by religious hatred. With the rise of Liberalism in Europe however, the emergence of the so-called "Jewish Problem" became a political weapon in the hands of reactionary groups and heads of States. Bismarck admitted he found it "a most useful means of attacking the progressives", and the pogroms under the Czars afforded means of diverting attention from State reforms. In France in the '90s a Jew gave his name to one of the most bitter political feuds that has occurred in any country (Dreyfus case), but the Germany of Hitler saw the transformation of racial prejudice into a main policy of State, with its attendant unprecedented persecutions.

Antlers are the branched horns of deer, the branches being called tines. Antlers originate as outgrowths of the frontal bone, and are usually shed once a year. Except in the reindeer and caribou they are restricted to the male.

Apartheid, an Afrikaans word meaning "a state of separateness," the policy of racial segregation pursued by the United Party under Hertzog and Smuts from 1934 onwards and with increasing intensity since 1948 by the Nationalist Party under Malan, Strydom and Verwoerd. In practice, it means the supremacy of the white man and the exploitation of and denial of democratic rights to the non-whites.

Ape, a term applied to the gorilla, chimpanzee, orang-utan, and gibbon—the anthropoid apes.

Aphelion, the point in the orbit of a planet farthest from the sun; the opposite of perihelion.

Aphids, green-flies or plant lice, a numerous species of destructive insects living on roots, leaves and plants. Parthenogenesis (virgin reproduction) is common among them.

Apis, the sacred bull worshipped by the ancient Egyptians; also the scientific name for the bee.

Apocalyptic writings are those which deal with revelation and prophecy, more especially the Revelation of St. John.

Apocrypha (hidden writings), the books which were included in the Septuagint (Greek) and Vulgate (Latin) versions of the Old Testament but excluded from the sacred canon at the Reformation by the Protestants on the grounds that they were not originally written in Hebrew nor regarded as genuine by the Jews. The books include: 1 and 2 Esdras, Tobit, Judith, additions to Esther, Wisdom of Solomon, Ecclesiasticus, Baruch, Song of the Three Holy Children, History of Susannah, Bel and the Dragon, Prayer of Manasses, 1 and 2 Maccabees. The term is usually applied to the additions to the old Testament, but there are also numerous Christian writings of the same character.

Apogee, meaning the greatest distance of the earth from any heavenly body, but restricted to the sun and moon. The sun's apogee corresponds to the earth's aphelion, and the moon's apogee is the point in its orbit most remote from the earth. *See* **Perigee.**

Apollinarians, followers of Apollinaris, Bishop of Laodicea, who lived in the 4th century, and denied the humanity of Christ. In opposition to Arianism. Condemned as heretics.

Apostasy is a revolt, by an individual or party, from one form of opinions or doctrine to another. Julian, the Roman Emperor (331–63), brought up as a Christian, became converted to paganism and on coming to the throne (361), proclaimed religious toleration. Hence his name, Julian the Apostate.

Apostles. The twelve apostles who were disciples of Jesus were: Simon, Peter, Andrew (his brother), James and John (sons of Zebedee), Philip, Bartholomew, Thomas, Matthew, James, Thaddaeus, Simon, and Judas Iscariot. After the Ascension Matthias was chosen to take the place of Judas. St. Paul is always referred to as the chief apostle, though he is not one of the twelve. St. Barnabas has also been called an apostle.

Apostles' Creed, applied to the most ancient of the Church's statements of its belief: "I believe in God the Father Almighty; and in Jesus Christ his only Son our Lord, who was born of the Holy Ghost and the Virgin Mary. . . ." A later version is used in the Church of England at morning and evening prayer.

Apostolic Council, held at Jerusalem, about A.D. 50, presided over by James, to decide what the obligations of Christians were to the Mosaic law.

Apostolic Fathers were the immediate disciples or followers of the Apostles, especially such as have left writings behind them, including Barnabas, Clement, Hermas, Ignatius, Polycarp, etc.

Apostolic Succession is the derivation of holy orders by an unbroken chain from the Apostles, and the succession of the ministry to the powers and privileges of the Apostles.

Apotheosis was the Greek term for the inclusion of a mortal among the Gods. Divine honours were accorded to Julius Cæsar and Augustus.

Apparitions, ghosts, phantoms, spectres, regarded by modern authorities as hallucinations of telepathic origin. (*See* **Telepathy.**)

Appeasement Policy. The name of the policy during 1937 and 1938 of yielding to the demands of Hitler and Mussolini in the hope that a point would be reached when the dictators would co-operate in the maintenance of peace. The policy culminated in the Munich Agreement (which was the subject of much criticism) after a series of concessions including the recognition of the Italian conquest of Abyssinia and the German annexation of Austria. The policy was finally demonstrated as futile when Hitler seized Czechoslovakia in March 1939.

Appian Way, the oldest and finest of the Roman roads originally laid by Appius Claudius (312 B.C.) from Rome to Capua and thence to Brundisium (Brindisi).

Approved Schools *or* **Home Office Schools** are residential schools for the training of children and young persons who, because of bad environment or parental neglect, are guilty of offences or in need of care and protection and have been sent to them by magistrates from juvenile or other courts. A pupil who refuses to submit to discipline may be sent to a Borstal institution.

April, the fourth month of the year, from the Roman *Aprilis* derived from *aperire* "to open"—the period when the buds begin to open.

Apse is a semicircular recess at the east end of the choir or chancel of early churches, and vaulted over.

Aquatint is a method of etching on copper, by which imitations of drawings in water-colours, Indian ink, bistre, and sepia are produced.

Aqueducts are conduits in which water flows or is conveyed from its source to the place where it is to be used. Most famous builders were the Romans and the oldest Roman aqueduct was the Aqua Appia, which dates from about 310 B.C. Among modern aqueducts may be mentioned that of Glasgow, which brings water to that city from Loch Katrine; that of Manchester, which taps Thirlmere; that of Liverpool, with Lake Vyrnwy in North Wales as its source, and the Fron Aqueduct, Radnorshire which carries water from the Elan Valley to Birmingham.

Arabesque, the term applied to the elaborate decorations introduced into Europe by the Spanish Moors. The arabesques of the Vatican galleries, by Raphael, form a splendid example.

Arabian Nights, a collection of fascinating tales of the Orient, of mixed Indian, Persian, Arabic, and Egyptian origination, and first made known in Europe by Antoine Galland, a French Oriental scholar whose original translation was called *The Thousand and One Nights*. *See* **G32 (1).**

Arabic Numerals, consisting of the characters, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, had their roots in India, whence they passed to Baghdad in the second half of the 8th century and were introduced by way of Spain to Europe in the 12th century, taking the place of the Roman numerals.

Aragonite, a mineral consisting of carbonate of lime in a crystalline form, sometimes found pure and sometimes mixed with other metals in minute quantities. Crumbles to powder under heat.

Aramaic Languages, the Semitic dialects current in Mesopotamia and the regions extending south-west from the Euphrates to Palestine from about the 12th century B.C. until after the rise of Islam, when Aramaic was superseded by Arabic. Both Aramaic and Greek were spoken in Palestine during the time of Christ.

Arbalast, a steel crossbow set in a shaft of wood and worked with a trigger, introduced by the Normans.

Arcadia, a district of Peloponnesus (Morea) whose inhabitants in the days of the Pelasgians were of extreme simplicity, and the term has ever since been used to denote an idealised country of happy, natural beings.

Archaeopteryx, a fossil bird providing a connecting link between reptiles and birds. Reptilian features are: teeth in the jaws, a long lizard-like tail and claws to the fingers. The beast was clad in feathers, not scales. The first specimen, found in 1861, in the Solenhofen limestone of Bavaria, is in London's Natural History Museum. *See also* **F22 (2).**

Archbishop, the chief of the bishops of an ecclesiastical province in the Greek, Roman, and Anglican churches. In the Church of England there are two archbishops, the Archbishop of Canterbury, called the Primate of *all* England, and the Archbishop of York, styled the Primate of England.

Archimedes' Principle. When a body is weighed in air and then in any fluid, the apparent loss in weight is equal to the weight of fluid displaced. This scientific fact was noted by the Syracusan philosopher Archimedes (287–212 B.C.).

Architecture, the art and science of building. The provision of shelter for mankind by the orderly arrangement of materials in a manner which expresses man's attitude to living. The forms which buildings take are the outcome of the function for which they are to be used, of the architect's æsthetic sensibility and of the structural method adopted. Until the last hundred years structural methods were limited to timber frames, and columns, lintels, load-bearing walls, arches, vaults, and domes in brick or stone. From these few basic elements have evolved the great variety of historic styles of building to be found throughout the world. To give but one

example, the Greeks created those systems of decorated columns and beams, known as the Orders, which were adapted by the Romans, revived decoratively rather than structurally during the Renaissance and are still used in debased form on the more presumptuous type of modern building. In recent years, however, architecture has taken on a new meaning. Once confined to the rich, in the form of Church, State, or Commerce, it is now, with the coming of democracy, recognised as an essential social service for all. This, and the development of new structural techniques and materials (steel, aluminium, sheet glass, reinforced concrete, plastics, and plywoods, to name a few), have made the interest in historic styles, the mainstay of the older architect, of secondary importance. Modern architecture is the creation of buildings with the highest possible standards of functional performance in terms of efficient planning and structure, good artificial and natural lighting, adequate heating or cooling, and proper acoustic conditions consistent with the price the client can afford to pay. At the same time the architect's task is to design a structure, and the spaces the structure delimits, internally and externally, which are æsthetically stimulating and satisfying, and well related to the land and buildings around. *See* section G. for historical development.

Arctic Exploration. Modern exploration of the Arctic begins in the 16th century, when men sought to reach the East Indies by sailing through the Arctic to the Pacific Ocean. The North-east Passage, via the shores of northern Asia, was the first attempted. In 1553 and 1554 the English navigators Sir Richard Chancellor and Stephen Burrough sailed into the White Sea, but were prevented by storms and ice from advancing farther eastwards. The project was later revived by the Dutch; Barendts in 1594 discovered Spitsbergen, but also failed to get beyond Novaya Zemlya. It was not, in fact, until 1879 that the Swede, A. E. Nordenskiöld, in the *Vega*, succeeded in reaching the Pacific. The attempts to find a North-west Passage were more numerous and determined. In 1585 John Davis penetrated Davis Strait and coasted along Baffin Island. Hopes ran high when Henry Hudson discovered Hudson Bay in 1610, but a practicable passage continued to elude explorers. The problem was to find a navigable route through the maze of channels in the short summer season, and to avoid being frozen in with supplies exhausted. After the Napoleonic Wars the Admiralty sent out many naval expeditions which culminated in Sir John Franklin's expedition with the *Erebus* and *Terror* in 1845. The ships were beset by ice in Victoria Channel and, after Franklin's death, were abandoned by their crews, who perished from scurvy and starvation on their march southwards. To ascertain their fate, several further expeditions were despatched, and the crew of the *Investigator*, commanded by R. J. M'Clure, sailing eastwards from Bering Strait, were the first to make the Passage, though in doing so they were obliged to abandon their ship. It was thirty years before the Norwegian, Roald Amundsen, succeeded in sailing the *Gjoa* from east to west. In the meantime, the North Pole had become the goal of explorers. Nansen, in 1893, put the *Fram* into the ice-pack to drift across the Polar basin, and himself made an unsuccessful attempt on the Pole across the pack. This was eventually achieved by the American explorer Robert E. Peary, who after several expeditions in the North Greenland region, sledged to the Pole with Eskimo companions in 1909. The next phase was the employment of airships and aeroplanes in Arctic exploration. In 1926 Admiral Byrd made the first flight over the Pole, and in the same year Amundsen and Lincoln Ellsworth flew the airship *Norge* from Spitsbergen to Point Barrow, Alaska. Two years later, the *Italia*, commanded by the Italian, Nobile, was wrecked on a return flight from the Pole, and Amundsen lost his life in an attempt to rescue the survivors. With modern developments in aircraft and navigation, flights over the Polar basin are almost a routine matter, and passenger flights between Europe and America via northern Greenland are being pioneered. The first voyage under the North Pole was made in August 1958 by the American nuclear-powered submarine *Nautilus*.

Arenacious Rocks, the rocks composed of grains of sand, chiefly sandstones; quartz and felspar being the most abundant minerals in these rocks.

Argillaceous Rocks are a sedimentary group, including the shales and clays.

Argon, a chemical element discovered by Rayleigh and Ramsay in 1894 in air. Argon is used for filling gas-filled metal filament electric lamps. In gas discharge tube it glows brightly, as does neon, but the colour of the discharge is blue instead of red.

Aria, a song consisting of a first part, a second part, and a repetition of the first part. Songs of this type commonly occur in 18th-century operas and oratorios. The term has been loosely extended to cover airs rendered solo by principal characters in opera.

Arianism, so called after Arius of Alexandria, who denied Christ's divinity. The doctrine was condemned at the Councils of Nicæa (325) and Constantinople (381).

Aries, the Ram, the first of the signs of the Zodiac.

Arithmetic, the branch of mathematics that deals with numerical calculations as in counting, measuring, weighing. The early civilisations used simple arithmetic for commercial purposes, employing symbols and later letters of the alphabet as numerals. When Hindu-Arabic numerals replaced Roman numerals in the Middle Ages it meant a great step forward and led to rapid developments—the invention of logarithms, slide-rule, calculating machines.

Ark of the Covenant was the sacred chest, overlaid with gold, which occupied the inner sanctum of the Temple, and symbolised God's covenant with his people.

Armada, Spanish, the naval expedition fitted out by Phillip II. of Spain in 1588 against England, commanded by the Duke of Medina Sidonia. It comprised 129 ships, was manned by 8,000 sailors and carried 19,000 soldiers and more than 2,000 cannon. Against this formidable force Elizabeth had only 80 ships, manned by 9,000 sailors, under Lord Howard of Effingham, under whom served Drake, Hawkins, and Frobisher. The British Fleet awaited the Armada off Plymouth, and at Tilbury there was a considerable defensive land force under the command of the Earl of Leicester. On July 19 the ships of the Armada were sighted off the Lizard, disposed in a crescent seven miles long from horn to horn. The excellent manœuvring of the English, their fire-ships, and a gale from the N.W. combined so effectively to cripple the Spanish ships that the Armada was scattered in confusion, a very small remnant contriving to reach home via the North of Scotland. It was impossible to embark the army of Parma waiting in the Netherlands. Elizabeth had a medal struck bearing in Latin the inscription, "God blew, and they were scattered."

Armadillo, a genus of animals related to the sloths and anteaters, belonging to South America, and carrying a hard bony covering over the back, under which the animal can completely conceal itself when attacked, rolling itself up like a hedgehog.

Armageddon, according to the Revelation of St. John, the great battle in which the last conflict between good and evil is to be fought.

Armillary Sphere, an early form of astronomical apparatus with a number of circles representing equator, meridian, ecliptic, etc. Used by Hipparchus and Ptolemy and up to the time of Tycho Brahe for determining the position of the stars.

Arminianism, the doctrine of Arminius, originally Jakob Harmensen (1560–1609) of Holland, a devout Christian who opposed Calvinism and the doctrine of predestination. In England a modified Arminianism became the theology of Wesleyan Methodism.

Army. Sweeping changes in Britain's defence policy were announced in 1957 involving reorganisation of the Army and affecting the regimental system. There is to be no further call-up under the National Service Acts after the end of 1960. The effect of this reorganisa-

tion was to reduce the strength of the Army to about 180,000 by 1962 and (by amalgamation) the number of regiments of infantry of the line from 64 to 49.

Arpeggio, a chord whose notes are played in ascending or descending sequence, as on a harp.

Arsenic, a metallic element, of a crystalline and brittle nature, usually met with as a constituent of other minerals, sometimes by itself. Its compounds are very poisonous. Lead arsenate is a powerful insecticide used for spraying fruit trees.

Artesian Wells take their name from Artois in France, where the first wells of this kind were constructed in 1126. They are to be found only when a water-bearing bed is sandwiched between two impervious beds. When a boring is made to the lower part of the bed, the pressure of water is sufficient to cause the water to overflow at the surface. Artesian wells were known to ancient Egypt and China, and have existed in the Sahara since the earliest times. The fountains in Trafalgar Square are fed by artesian wells sunk through the London clay into the chalk about 400 ft.

Arthur's Seat, a hill of volcanic origin, 823 ft. high, dominating Holyrood Park, to the south-east of Edinburgh.

Articles. The *Six Articles* are those contained in an Act of Henry VIII. and were of Roman Catholic origin. The *Thirty-Nine Articles* drawn up in 1563 comprise the doctrines of the Anglican Established Church, and must be subscribed to by all taking holy orders therein.

Arts Council of Great Britain. Founded during the war to assist in maintaining the art of the theatre. With a sum allotted by the Treasury, the Council supported small companies which would have been forced to close by war conditions. As a result companies presented plays by Shakespeare, Ibsen and Shaw in rural and industrial areas which had never been visited by actors. Moreover, the Theatre Royal, Bristol, one of the oldest and most beautiful playhouses in the country, was saved. Parliament made a grant-in-aid of £1·5 million to the Arts Council for the year 1960–61 to foster opera, ballet, music, drama, painting and poetry.

Arum, a genus of plants of the Araceæ order, of which there is but one British species, the wake-robin or cuckoo-pint, sometimes also styled "Lords and Ladies." Its pointed leaves and spikes of scarlet berries are familiar hedgerow objects. The latter are poisonous. The starch in the tuber was formerly used as food under the name "Portland arrowroot."

Arundel Marbles, a collection of ancient Greek sculptures formed by Thomas Howard, Earl of Arundel, in the 17th century and presented to Oxford University by his grandson, Henry Howard, who became Duke of Norfolk.

Aryan is a term used to denote the lingual and ethnological groups otherwise known as Indo-European or Indo-Germanic. Comprises two branches, Western or European, and Eastern or Armenian. The Aryan languages show common origin by their vocabulary, syntax, and inflexions. The word *Aryan*, derived from the Sanskrit, means an "honourable lord of the soil"; the nearest to the parent tongue is Sanskrit, and the chief divisions in Europe are the Teutonic, Romance, Slav, and Celtic. The Turks, Magyars, Basques, and Finns are non-Aryan. The common ancestors of the Aryan group dwelt among the Pamirs at a period of remote antiquity.

Asafœtida, an evil-smelling gum resin exuded from the stem and roots of the *Ferula* genus found in Persia and Afghanistan. As a drug formerly used by doctors to help cure hysteria.

Asbestos, a fibrous mineral which is fireproof. Mined in Canada, S. Africa, S. Rhodesia, U.S.A., Swaziland, U.S.S.R., Cyprus, France, Italy. Woven into fireproof garments for firemen, gloves for furnacemen. Used for lagging steam pipes and boilers. Asbestos board is used in the building trade.

Ascension Day, or Holy Thursday, is the 40th day after Easter.

Asceticism was originally the term applied to the training undergone by Greek athletes. The Stoics and others used it to express the mastering of the passions. The idea passed into Christianity, and from celibacy and abstinence it was carried to extreme lengths in the way of self-mutilation and even torture. Monasticism was one of its manifestations.

Ascot Races are an annual fashionable function dating from 1711 and taking place on Ascot Heath, only six miles from Windsor, in June. Have always had royal patronage. The course is nearly two miles long.

Asdic, echo-sounding instrument, used in ships to detect underwater objects, for instance, U-boats, wrecks, shoals of fish, etc.

Ash, a familiar deciduous tree of the genus *Fraxinus*, of over 60 species, native to North-temperate regions. The ash held an important place in Norse mythology, as it was supposed to support the heavens with its roots in Hell. The species native to Britain, and to Europe, is *F. excelsior*, a tall tree with compound leaves, greenish flowers, winged seeds, and black buds in winter. It is a valuable timber tree, tough and elastic, and largely used for wheels and handles. The rowan is known as "mountain ash," but its only resemblance to the ash is in the shape of its leaves. *F. pendula* or weeping ash is a weeping strain which makes an ideal natural summer house.

Ashburton Treaty was signed between Great Britain and the United States in 1842 and settled the north-east boundary dispute by a compromise line between Maine and Canada.

Ashes, The, the symbol which distinguishes the winning cricket team in the Australian Test Matches. In 1882 the Australians won at the Oval by 7 runs. After the match the following epitaph appeared in the *Sporting Times*: "In affectionate remembrance of English Cricket which died at the Oval on Aug. 29, 1882, deeply lamented by a large circle of sorrowing friends and acquaintances. R.I.P. NB. The body will be cremated and the ashes taken to Australia." When the English Eleven went to Australia the same winter it was said that they had come to recover the "ashes." England won two out of three matches, and after the third match the ashes of what is now generally believed to have been a stump were presented in an urn to Ivo Bligh, later Lord Darnley. He bequeathed the urn to the M.C.C., and it now stands in the Memorial Gallery at Lord's.

Ash Wednesday, first day of Lent, on which ashes are sprinkled on the head as sign of penitence under an injunction of Pope Gregory the Great in the 6th century.

Asmodeus, a demon whose story appears in the apocryphal book of Tobit, and figures frequently in Jewish traditions. Asmodeus is the supernatural figure in Le Sage's *Le Diable boiteux*.

Asp, a small poisonous snake, often mentioned in ancient literature and traditionally supposed to have been used by Cleopatra in killing herself. Probably the Egyptian Horned Viper (*Cerastes*).

Asphalt is the name given to a variety of bituminous substances that (1) occur naturally or (2) from the residue after petroleum distillation. Is largely used, mixed with sand, granite chips, etc., for making road surfaces. It was used in Mesopotamia some 5,000 years ago as a mortar for brickwork and for damp-courses to baths. Rock asphalt is obtained from mines in Switzerland, France, Sicily, and Germany, and lake asphalt is obtained commercially from the famous lake in Trinidad.

Assassination, treacherous murder for political ends, usually of a ruler or distinguished person. Among the most famous assassinations of history were: Julius Cæsar, 44 B.C.; Thomas à Becket, 1170; David Rizzio, 1566; William the Silent, 1584; Henry IV. of France, 1610; Jean Paul Marat, 1793; Abraham Lincoln, 1865; Alexander II. of Russia, 1881; Archduke Francis Ferdinand of Austria, 1914; Dr. Dollfuss, 1934; King Alexander of Yugoslavia, 1934; Mahatma Gandhi, 1948; King Abdullah of Jordan, 1951; Liaquat Ali Khan, 1951; King Feisal of Iraq, 1958; Mr. Bandaranaike, 1959.

Assumption of the Virgin. The Roman Catholic belief, that the Blessed Virgin ascended bodily to heaven after her death, was proclaimed by the Pope towards the end of 1950. It is now, therefore, binding on all Catholics under pain of anathema and the guilt of mortal sin. Protestants are liable to make the mistake of

supposing that such dogmas are new additions to the faith invented by the Pope of the moment. According to Catholic doctrine, no addition can be made to the "faith once delivered to the saints," and every dogma is justified by reference to Bible texts and the traditions of the Church. Both Eastern and Western Churches have been permitted to believe in the Assumption of the Virgin for over a thousand years, and the new dogma merely clarifies the old belief and makes it binding on the faithful.

Asteroids were unknown until the discovery of Ceres by Piazzi in 1801. More than 1,500 have been recognised and many more are believed to exist; since 1891 their paths have been identified by exposed photographic plates. Most of these planetoids or minor planets are mere celestial footballs, the majority having a diameter of well under 50 miles. Ceres, with a diameter of *c.* 480 m. is the largest, then there are Pallas (*c.* 304 m.), Juno (120 m.), Vesta (240 m.), Astraea, Adonis, Hermes, Hidalgo, Eros, Amor, Apollo, and the Trojan group which all take their names from Homer's *Iliad*—Achilles, Patroclus, Hector, Nestor, Priam, Agamemnon, Ulysses, Aeneas, Anchises, Troilus, Ajax, and Diomede.

Astrolabe, a mediæval scientific instrument for taking altitudes, observing the sun by day and the stars by night, and used for telling the time and finding the latitude. Used by the ancient Greeks, later by the Arabs and Persians, and introduced into Europe by way of Spain in the 14th century. Chaucer is said to have sent his son Lois, a ten-year-old student at Oxford, an astrolabe with a treatise on its use in 1391.

Astrology, an ancient superstition which prevailed among the Chaldeans, Egyptians, and Etruscans and had a powerful influence in Europe of the Middle Ages, though not so much upon the Greeks. Formerly astrology had two branches—judicial astrology, the study of the supposed influence of the stars on human destiny, and natural astrology, dealing with calculation of movements of heavenly bodies, time, tides, eclipses, etc., out of which grew the science of astronomy. That the stars control human affairs is an absurd and dangerous belief, yet still accepted by many, judging by some Sunday newspapers.

Astronomy, the oldest and one of the most fascinating of sciences, was in early times associated with astrology, but by a long series of observations and mathematical calculations a gradual knowledge of the movements of the heavenly bodies grew up. Pythagoras (520 B.C.) understood the revolution of the earth upon its axis, but it was not until two thousand years later that his theory gained general acceptance, when the keen and spacious minds, first of Copernicus, and then of Tycho Brahe and Galileo, demonstrated the truth of the Pythagorean theory. With the setting forth of the Copernican system, astronomy was placed on a sure foundation, and the movements of the planets began to be more clearly comprehended. The studies of Kepler and Galileo, making their observations with the telescope, resulted in an immense increase of astronomical knowledge. Newton, to whom we owe the discovery of the law of gravitation, the improvement of the telescope and many other discoveries, placed physical astronomy on well-defined lines. Two great landmarks in more recent times were the discovery of Uranus by Herschel in 1781 which extended the solar system as then recognised, and the estimation by Hubble in 1924 of the distance of Andromeda of nearly a million light years (more recent determinations give 1,500,000 light years), which showed that our Galaxy was just one of many. Today radio-astronomy is advancing astronomical knowledge and making it possible to explore regions beyond the scope of optical telescopes. *See* **Telescopes, Observatories, Galaxy,** *and also* **F3 7.**

Astrophysics, a branch of astronomy concerned with the physical nature and constitution of celestial bodies. Since the second half of the 19th century the application of spectroscopy and photometry has been responsible for the great advance in this branch of science.

Athanasian Creed, one of the three ancient creeds of the Christian Church, often referred to as the *Quicunque Vult*, is a statement of the doctrine of the Trinity and the Incarnation, and though named after St. Athanasius, the view is now widely held that it is the work of St. Ambrose (339–97). (*See also* **Apostles' Creed** and **Nicene Creed**).

Atheism is the denial of the divine, and it assumes three forms—denial of the existence of God, denial that God has been *proved* to exist, and denial of the possibility of knowing of divine existence.

Athodyd, also called "Ramjet" or "Propulsive Duct." This can be considered as an extremely simple gas-turbine engine, without any rotating parts. A power plant with great possibilities for high-speed aerial flight, it consists of a diffuser, combustion chamber, and exhaust chamber and its thrust results from the fact that the gases leaving the athodyd have a higher velocity than the gases entering it.

Atlantic Charter. A document of eight points drawn up by Sir Winston Churchill and President Roosevelt on a man-o'-war in the Atlantic in Aug. 1941. Although a very important document, since it declared the intentions of Britain and U.S.A., it remained informal and was not in fact signed (to obviate necessity for approval by the U.S.A. Senate). The eight points were briefly on the following subjects: (1) No aggrandisement; (2) No territorial changes without wishes of the people; (3) Restoration of self-government to those deprived of it; (4) Access to trade and raw material by all peoples; (5) Improvement of labour standards and social security; (6) Freedom from fear and want; (7) Right to traverse high seas without hindrance; (8) Disarmament of aggressor nations pending a permanent system of general security.

Atlantic Records. The first crossing of the Atlantic by Columbus in 1492 took 70 days, while the first crossing by steam-boat in 1838 was made in 17 days. The Atlantic Blue Riband is now held by the American liner *United States*, which in July 1952 completed the 2,942 sea miles from Ambrose light-vessel to Bishop Rock in 3 days 10 hours 40 minutes (35·59 knots), beating the Queen Mary's 1938 record time of 3 days 20 hours 42 minutes (31·69 knots). The first flight was made in 1919 by Sir John Alcock and Sir A. W. Brown in a Vickers-Vimy biplane from Newfoundland to Ireland (1,890 miles) in 16 hours. The first solo flight was made in 1927 by Charles A. Lindbergh from New York to Paris. The first airship to cross from Scotland to New York was the British R.34. The first regular passenger flight was made by the *Dixie Clipper* in 1939.

Atmosphere is the gaseous envelope of the earth, and consists of a mixture of gases (*see* **Air**) and water vapour, the variability of the latter being of great importance meteorologically. At levels accessible to measurement there is no appreciable change in the relative proportions of the gases, but the greatest part of the ozone would seem to occur in a layer 15–25 miles above the earth's surface. The lower level of the atmosphere up to a height of about 7 miles (6 miles at the Poles and 10 miles at the Equator) is known as the *troposphere*, and it is in this region that nearly all weather phenomena occur. This is the region of most interest to the forecaster studying temperature, humidity, wind-speeds, and the movement of air masses. Temperature falls with height by about 3° F. per 1,000 ft. The *tropopause* is the boundary between the troposphere and the *stratosphere*. Temperature varies little in the lower levels of this region; it is mainly cloudless, and has no vertical currents. Strangely enough, the lowest temperatures of the atmosphere are to be found not at the Poles, but at about 11 miles above the Equator, where a temperature as low as —110° F. has been recorded! The thickness of the stratosphere is not known exactly, but temperatures begin to rise about 20–25 miles from the earth's surface at about the same rate as they fall in the troposphere, owing, it is thought, to the absorption of solar radiation by the concentration of ozone. Recent war-time re-

searches in England have shown that stratospheric air is extremely dry. The uppermost region of the atmosphere is the *ionosphere*, extending to 300 miles from the earth's surface, and containing the Heaviside layer (at about 60–70 miles) and the Appleton layer (at about 120–200 miles); it is in this region that the auroræ normally occur. *See* **F9, 46** (1).

Atmospherics are electrical impulses which are believed to originate in atmospheric electrical discharges such as lightning. They give rise to crashing background noises in the loudspeakers of radio sets, interfering with reception at distances of up to 4,000 miles from the centre of the disturbance. The location of atmospherics with the aid of radio direction-finding methods gives warning of the approach of thunderstorms.

Atom, the smallest unit of an element which can take part in a chemical reaction. Prior to the discovery of radioactivity by Becquerel in 1896 the atom was looked upon as something hard and solid like a billiard ball. It was also thought to be indivisible. This concept was replaced by the Rutherford–Bohr atom (1913). According to this hypothesis the atom resembles a miniature solar system, with the nucleus as the sun, the electrons the planets, and the rest empty space. If the nucleus were enlarged a million million times it would be no greater than a pea but the atom itself would fill the Albert Hall. The nucleus itself has a composite structure, being built of protons and neutrons. The simplest atom is that of hydrogen, with a single electron and a nucleus consisting of a single proton. Biggest naturally-occurring atom is uranium atom with 92 protons in the nucleus. *See* **F9-12.**

Atomic Bomb, this weapon was the result of the concerted efforts of a team of scientists during the impelling urgency of the second world war. They succeeded in releasing an explosive discharge of atomic energy by the fission process. The vast sums and resources necessary for the production of the bomb determined the U.S.A. as the country of its origin. The first bomb was discharged on test in New Mexico (16.7.45), when the effects of blast, heat, and radiation were measured. Its use on Hiroshima (5.8.45) and Nagasaki (9.8.45) was a main cause of the collapse of Japanese opposition in the Far East. In an atomic bomb pieces of uranium 235 or plutonium 239 are brought together until a critical size is exceeded, when an uncontrollable chain reaction is set up. The energy released in the fission of 1 kg. of uranium is about equivalent to that involved in the explosion of 20,000 tons of T.N.T. A development of the atom bomb is the thermonuclear or hydrogen bomb which is a weapon not only a thousand times more powerful than a fission bomb but different in kind. Atomic and hydrogen bombs not only unleash energy but give rise to radioactivity which can induce hereditary changes in plants and animals. It is to be hoped enough bombs have already been exploded to convince mankind that the only alternative to total annihilation is to live together in the world as good neighbours. *See also* **F11** (1).

Atomic Number. The number of protons in the nucleus of the atom, positively charged, equalling and balancing the number of surrounding electrons, negatively charged, is called the atomic number. *See* **N30, F10** (2), **60** (1).

Atomic Pile, an apparatus containing a fissionable element and a moderator, such as heavy water or graphite, in which a self-sustaining fission process proceeds at a controllable rate. The first atomic pile, constructed on a squash court at Chicago, was operated for the first time on December 2, 1942, under the direction of Dr. Enrico Fermi. The pile contained 12,400 lb. of uranium. *See* **F51** for an account of civilian nuclear reactors.

Atomic Weight, the weight of an atom of an element relative to the weight of an atom of oxygen (16·0000). *See* **N30, F10** (1), **60** (1).

Atrium was the central court of a Roman house, uncovered in the centre, usually with a marble tank (impluvium) beneath the opening into which rain could fall.

Attar of Roses, an essential oil used in perfumery and obtained from the fresh flowers of *Rosa damascena* grown in Bulgaria, Anatolia, France, and Kashmir.

August, named after the Emperor Augustus, because it was his " lucky " month.

Auks, duck-like sea-birds, black and white, with short narrow wings, compact bodies, and legs set well back. Breed in colonies on rocky coasts of N. Europe (incl. British Isles) and spend most time in coastal waters. Migrate south in winter. The Auk family includes the Razorbill, Little Auk, Guillemot, and Puffin. The Great Auk became extinct in the 19th century after ruthless hunting for the sake of its feathers. Except for the Black Guillemot, they lay only one egg a year.

Aulic Council, a supreme court of the Holy Roman Empire, established by Maximilian I., in 1501.

Aurora Borealis *or* **Northern Lights,** visible in London on seven nights a year on the average, but increasingly so farther north, *e.g.*, observed in the Shetlands about one night in every four. The zone of maximum frequency surrounds the north magnetic pole and includes Greenland, northern Canada, and the north coast of Alaska. Auroral displays may take several forms (dawn-like glow, often with rays streaming upward, curtain, and corona of rays radiating from a point high in the sky), sometimes changing rapidly with pulsating effects. The aurora is an electrical discharge at great heights, the agent responsible arising in the sun, and is generally accompanied by magnetic storms. The southern lights of the Southern Hemisphere are called the aurora australis. *See* **F46** (1) for upper atmospheric phenomena.

Austerlitz, Battle of, was fought near Brünn, in Moravia, on December 2, 1805, when Napoleon defeated the Russians and Austrians under Kutuzon.

Auto-da-Fé, or Act of Faith, was the ceremony connected with the execution of heretics under the Inquisition of Spain and Portugal, the persons condemned being burned alive. The king and court generally attended in state.

Automation, a word coined by an American for automatic operation and control in industry by the application of electronic methods. The new technique has been defined as " the accomplishment of a job by an integrated mechanism with a minimum of assistance of any kind." Electronic machines are capable not only of reporting defects but correcting them by the application of information stored in them. Just as mechanisation replaced human labour in the industrial revolution of the 19th century, so today automation is replacing mechanisation.

Autonomy denotes the right of self-government, and was first used in reference to the municipalities of ancient Greece, where the right of separate government was allowed.

Autumn, the third season of the year, begins with the autumnal equinox, and ends with the winter solstice, but the term is generally understood as covering the period from mid-August to mid-November.

Auxins, substances which regulate the growth of plants; also called " plant hormones." Auxin preparations are finding practical use: *e.g.*, to promote root formation in cuttings, to prevent premature dropping of apples and pears.

Avalanches are of four kinds. (1) Powdery avalanches consisting of snow which has become loose and dry from long frost. (2) Creeping avalanches, which are loosened by Spring, but being on a gentle slope, creep down slowly by the force of their own weight. (3) Glacier avalanches, masses of ice which split off in summer with a great noise, and go tearing down a precipice to be smashed to pieces at the bottom. (4) The real avalanches of huge accumulations of snow, which are hurled over almost perpendicular walls of rock into the valleys beneath.

Avalon is the earthly paradise of Celtic mythology.

Aventine, one of the seven hills of Rome.

Avesta, the title of the sacred books of the Parsees.

Axe, one of the first tools devised by primitive man in all parts of the world. Axes of stone, bronze, and rough iron have been found in the geological strata.

Avocet, a graceful wading bird related to the stilts, of black-and-white plumage, bluish legs, and slender upturned bill. There are four species.

Avocets nest in colonies and there is one in the sanctuary on Havergate Island, Suffolk.

Aztecs, the name of a native and powerful race found in Mexico when the Spaniards first discovered that country, and with difficulty subdued. *See also* **G10, 11.**

B

Baal, the god of the sun, and meaning lord, or master, was worshipped by the ancient Chaldeans, Phœnicians, and Assyrians, and enters into the composition of many Semitic names: Jezebel, Hannibal, Beelzebub, Baalbek.

Babel, Tower of, described in Gen. xi. 9, the erection of which led to the confusion of tongues.

Babiroussa, a ferocious wild pig, native of the Celebes, sometimes called the horned-hog, from the fact that the long upper tusks, growing upwards, pierce the upper lip and curve backwards like the horns of some of the ruminants. It is longer-legged than ordinary swine.

Baboon, monkeys belonging to the African genus *Papio*. They are considered the lowest of the Old World (Catarrhine) monkeys, and walk on all fours. In the main terrestrial, but take to trees after food. The mandrill is closely related.

Babylonian Captivity, the period spent by the Jews in Babylon after Jerusalem was captured by Nebuchadnezzar, the Babylonian emperor, in 586 B.C. Traditionally the captivity lasted 70 years, but when Babylon was in turn taken by Cyrus in 538 B.C., the exiles were permitted to return to Jerusalem. The term is also applied in church history to the period 1309–77 when the popes were exiled to Avignon.

Badger, a carnivorous mammal related to the weasel, of nocturnal and burrowing habits, inoffensive, subsisting chiefly on roots and insects, though sometimes mice, young rabbits, and eggs form part of its diet. Badger-baiting was a favourite sport in Britain until it was prohibited in the middle of the 19th century.

Bagamond's Roll was the record by which the Scottish clergy were taxed prior to the Reformation.

Bagpipe. Once popular all over Europe, this instrument is still played in Scotland, Ireland, Brittany, and elsewhere. The bag acts as a reservoir of air and, when squeezed by the player's arm, forces air through the pipes. One of these, the Chanter pipe, provides the tune and is played by the fingers as in a flageolet. The remainder, the Drone pipes, give a continuous, unvarying note.

Bailey, comprised all the space within the outer walls of a castle or fortress.

Bailey Bridge, invented by Sir Donald Bailey and first used in N. African campaign 1942–3. Built up of pre-fabricated girders, it can be easily transported and erected.

Bailie, is a Scottish term for the magistrate of a municipal corporation or royal burgh.

Bailiwick, a feudal term denoting the limits of a bailiff's jurisdiction. The term has survived in the Channel Islands, where Jersey and Guernsey are Bailiwicks.

Bairam, a festival in Mohammedan countries.

Balance of Power is the doctrine in British policy whereby European groups should be so balanced as to prevent the emergence of a dominating Power. Thus the balance was maintained between the Triple Alliance (Germany, Austria and Italy) and the Triple Entente (Great Britain, France and Russia) and preserved peace from 1871 to 1914. After the first world war there was tentative support of Germany's recovery to counterweight a possible French hegemony; but when Germany's power grew under Hitler culminating in the second world war, Britain, France and Russia again became allies. With the growing power of Russia, a new system of alliances is being attempted.

Baldachin (It. *Baldachino*), a canopy usually supported by four pillars over throne, altar, or other sacred object. The name is also applied to the silken canopy used in processions and borne by the priest who carries the Host.

Baldrick, an ornamental belt worn across the shoulder or round the waist, to support bugle or sword.

Balearic Crane, the crowned crane of the Balearic Islands in the Mediterranean and the North African mainland, distinguished by its yellowish, black-tipped occipital tuft and by its trumpet note.

Baleen *or* **"whalebone"** the name given to a series of horny plates growing from the roof of the mouth in those whales classified as Whalebone or Baleen Whales (Mystacoceti). There are 250–300 or so plates on each side, and their inner edges are frayed, the whole system constituting a filter for collecting minute organisms used for food. The Baleen Whales include the Right-Whales, the Pacific Grey-Whale, and the Rorquals. (*See* **Whales.**)

Balista, a large military engine, of crude contrivance but considerable effectuality, anciently used for hurling missiles in war by the Romans and others.

Ballad, a popular song of adventure or romance such as a minstrel might sing. The term is now broadly applied to any popular song of simple theme and construction suitable for amateur performance. In literature the term signifies a narrative poem, especially one whose theme is based on folk-lore. *See also* **M6** (2), **12** (1).

Ballade, a piece of piano music which may fancifully be regarded as the musical equivalent of the poetic ballad: *e.g.*, the Ballades of Chopin.

Ballet is a combination of four arts; dancing, music, painting and drama, each of which is ideally of equal importance. The movement of the individual dancers and the "orchestration" of the whole group is in the hands of the choreographer. The dancer's training follows certain basic rules but save in classical ballet there is considerable freedom of movement. Ballet as we know it today developed professionally at the Court of King Louis XIV. of France, though it owes its origins to Italy and in the earliest times to Greece and Rome. Its movements were made up from the dances of courtiers, country folk and tumblers. Technique grew more complex as costume became modified, the body gaining complete freedom with the invention of tights. A succession of great dancers—French, Italian and latterly Russian left their imprint on the art. Contemporary ballet reflects the æsthetic of the Russian, Sergei Diaghilev. In England Dame Ninette de Valois has laid the foundation of a national ballet, at Sadler's Wells and Covent Garden, with a personality that reflects the national character. A Royal Charter was granted in Jan. 1957 setting up the Royal Ballet to co-ordinate the activities of the Sadler's Wells group.

Ballistics, the science dealing with the motion of projectiles, especially shells, bombs, and rockets. Great advances have been made in this science in recent years.

Ballistraria, a cruciform aperture in the walls of a fortress, through which the archers fired arrows.

Balloon, the modern balloon consists of a bag of varnished cloth or gold-beater's skin inflated with a gas lighter than air. The first ascent by man in a hot-air balloon was made on Nov. 21, 1783, and in a hydrogen balloon on Dec. 1, 1783. The most famous of the early scientific flights by manned balloons were those of the Englishmen Coxwell and Glaisher, in 1862, when a height of 7 miles was reached. The first aerial crossing of the English Channel by Blanchard and Jeffries was made on 7 Jan. 1785. Piccard's ascent to 10 miles, in 1931, marked the conquest of the stratosphere. Four years later the huge American balloon Explorer II. inflated with nearly 4 million cubic feet of helium, carried a team of scientists with their floating laboratory to an altitude of 14 miles. In 1957 a pressurised balloon carrying an American doctor rose 19 miles above the Earth. Captive kite-balloons were widely used in the war as defensive measures against air attack. Meteorologists send their instruments up in balloons to collect data about the upper atmosphere, and of recent years physicists have learned much about cosmic radiation from the study of photographic plates sent to the upper regions in balloons. Balloons are also used to launch rockets, the combination being called a "rockoon."

Balsam, a big genus (140 species) of flowering plants. Many species are cultivated for their showy flowers, *e.g. Impatiens noli-me-tangere*, the yellow balsam or "touch-me-not," so called

because the fruit explodes when touched, slinging out the seeds. Balsam fir is a conifer (*Abies balsamea*) from which Canada balsam gum is obtained.

Baltimore Bird, a lively black-and-orange-plumaged starling of the oriole sub-family extending from Brazil to Canada; builds a well-constructed hanging nest.

Bambino, an image of the Infant Christ in the church of the Ara Cœli at Rome, supposed to possess miraculous powers; also a term applied in Italian art to images of the Infant Christ.

Bamboo, a genus of strong grasses, some species growing to over 120 ft. in height; much used by oriental peoples for all kinds of purposes. The young shoots of some species are tender and esculent.

Banana (family *Musaceae*), a large herbaceous plant cultivated in moist regions of the tropics, and one of the most productive plants known. Main producing areas: Brazil, India, Tanganyika, Philippines, Honduras, Colombia, Mexico, Canary Is. Average annual world-production, 11 million tons.

Bandana, the name given to a red spotted handkerchief usually made of cotton, but formerly only applied to silk handkerchiefs of that colour and design.

Bandicoots, Australasian marsupial mammals, of about the size of a large rat or rabbit. They are burrowing animals living largely on insects. The rabbit-eared bandicoot, restricted to Australia, has shrew-like snout, long ears like a rabbit, and long crested tail. The long-nosed bandicoot has a spiny coat, unlike long silky coat of rabbit-eared bandicoot; it comes from E. Australia. The pig-footed bandicoot has two functional toes on the foot, like a pig.

Bank Rate, the rate at which the Bank of England discounts first-class bills of exchange. Increased from 5 to 7% on 19 Sept. 1957 (the highest since 1931), since when it has been reduced five times, ultimately to 4% on 20 Nov. 1958; increased to 5% on 21 Jan. 1960.

Banns of Marriage. *See* Q14 (1).

Banshee is a figure in Irish superstitions supposed to give warning of death.

Bantu, ethnic and linguistic group of African Negro peoples, widely spread over Africa south of the Congo. There are an enormous number of Bantu languages and dialects, including Swahili, Zulu, Luba, Kongo, and Ganda. The Bantu tribal groups, of which there are many, include the Zulu, the Matabele, the Basuto, and the Mashona.

Baobab, a tropical African tree. The species *Adansonia digitata* is one of the largest trees known, though not the tallest; the trunk can reach 30 ft. in thickness. The fruit is wood, but its juice provides a cooling beverage. The bark yields a fibre used for making rope and cloth.

Baptism is a rite practised, either with infants or adults, by almost all Christian sects except Quakers. In the Church of England the baptism of infants is regarded as the act by which they are admitted "into the visible Church of Christ." The Baptists perform the rite only with adults and by the immersion of the entire body.

Baptistery, a building or portion of building devoted to the rite of baptism.

Baptists came into notice at the Reformation. For a time they suffered much persecution, but gradually made headway by their zeal and sincerity. Their distinctive tenet is that every member must make his own profession of personal faith and allegiance to Christ before Baptism. To-day this sect is spread over all parts of the Protestant world, though not always in large communities. They are strong in the United States.

Barbary Ape, a large monkey belonging to the genus *Macaca*. It is the only monkey living in relative freedom in Europe, a small colony being found on the Rock of Gibraltar. It has no tail.

Barber, one whose occupation is to shave or trim beards, a hairdresser. In former times the barber's craft was dignified under the title of a profession, being conjoined with the art of surgery. Barbers first received incorporation from Edward IV. in 1461. In Henry VIII.'s reign they were united with the company of surgeons, it being enacted that the barbers should confine themselves to the minor operations of blood-letting and drawing teeth, while the surgeons were prohibited from "barbery or shaving." In 1745 barbers and surgeons were separated into distinct corporations by George II. The barber's sign consisted of a striped pole, from which was suspended a basin. The use of these symbols is still preserved.

Barberry, a genus of berry-producing shrubs containing a hundred species. Several species are cultivated for their flowers and bright berries. Has an interesting pollination mechanism; the base of each stamen is sensitive to touch, and insects probing for nectar cause top of stamen to spring inwards, so dusting visitor's head with pollen which is in position for pollinating next flower that is visited. The common barberry (*Berberis communis*) harbours one stage of the fungus that causes rust of wheat.

Barbican, a fortified entrance to a castle or city, with projecting towers. In the London street called Barbican there was formerly a barbican in front of the city gates.

Barcarolle, a Venetian gondolier's song applied to instrumental as well as vocal compositions.

Bard, among the ancient Celts a poet or minstrel whose mission was to sing of heroic deeds. He was supposed to have the gift of prophecy, and was exempt from taxes and military service.

Barebones' Parliament, so called from the nickname of one of its members, "Praise-God Barebones." It was specially selected by Cromwell, and sat from July 4 to Dec. 12, 1653.

Barilla, soda carbonate or soda ash obtained by burning certain salt-marsh plants (*e.g.* the saltwort, *Salsola kali*). It used to be in great demand, until the product of the Leblanc and then the Solvay ammonia-soda process was made available by the chemical industry.

Baritone, a male voice whose pitch lies between those of a tenor and a bass.

Barium, a soft, white metallic element usually occurring as sulphate of barium and carbonate of barium. It was first prepared by Sir Humphry Davy in 1808, as an amalgam, by electrolysis of barium chloride. The pure metal was not isolated until 1901.

Barium meal. Barium sulphate is opaque to X-rays and before taking X-ray pictures of the alimentary canal radiologists give a "barium meal" to the patients so that the alimentary canal shows up more clearly.

Barley, a cereal plant whose grain is chiefly used for animal feeding and in the malting industry. Chief producing areas: U.S.S.R., China, U.S.A., Canada, Europe. World production, 57 million tons a year.

Barnacles constitute a sub-class of the Crustacea. The barnacle fouling the bottom of ships is the Goose Barnacle, which has a long muscular stalk and a shell composed of five plates. The Acorn Barnacles, which cover rocks, breakwaters, etc., just below high-water mark are similarly constructed, but they have no stalk. The manner of feeding of barnacles was vividly described by T. H. Huxley, who said the barnacle is "a crustacean fixed by its head kicking the food into its mouth with its legs." It was a naval surgeon, J. Vaughan Thompson, who discovered in 1830 that barnacles have a free-swimming larva (or nauplius). In the Middle Ages a curious myth grew up to the effect that the Barnacle changed into a sea-bird called, for that reason, the Barnacle Goose.

Barometer is an instrument for measuring atmospheric pressure, invented at Florence by Torricelli, pupil of Galileo, in 1644. The standard method consists of balancing the air column against a column of mercury, used on account of its high density. The mercury is contained in a long glass tube, closed at one end, and inverted in a cistern also containing mercury. The height of the mercury column, supporting the air column, is taken as the pressure at the time, and can be read off very accurately by means of a vernier scale. Present-day tendency is to express the readings in units of pressure instead of length, the millibar being adopted (1 mb = 1000 dynes per sq. cm.; 1000 mb $\equiv$ 29·53 inches of mercury approx.). The standard instrument is correct for pressures at 0° C. in Lat. 45°, so that corrections have to be applied for temperatures and latitudes other

than these. Also a correction has to be made for reducing the pressure to mean sea level. (*See* Aneroid.)

Baron, title given in 13th-century England to the highest class of King's tenants-in-chief. The first baron created by letters patent was John Beauchamp de Holt, Baron of Kidderminster, on October 10, 1387. The title derives from the Latin "baro" meaning "a man." In old legal diction "baron et feme" meant "man and wife." To-day a baron is a member of the fifth and last grade of the peerage and is addressed as "Lord."

Baronet, a title instituted by James I. The first baronet was Sir Nicholas Bacon, but numerous others were made about the same time, the fee charged for the honour in each case being about £1,000. It is the lowest hereditary title, and is freely dispersed among those who distinguish themselves in trade, industry, politics, or special civic service. James I. limited the number of baronets to 200, but to-day no number is specified. A royal warrant in 1910 commanded an official list of baronets to be prepared.

Baron of Beef, a double sirloin, not often seen in these days, but common in olden times at court and civic feasts.

Barque, a small sailing vessel with three or four masts. A three-masted barque has fore- and mainmasts square-rigged, the mizzenmast fore- and aft-rigged.

Barrel Organ, a musical instrument in which the music is made by a barrel or cylinder, set with pins and staples, which rotate so as to open the valves for admitting the wind to the pipes. Now almost, if not entirely, superseded by other musical instruments.

Barricades are temporary street fortifications usually erected by insurgents at times of revolution, and the most notable have been those of Paris. In 1830, 1848, and during the Commune disturbances of 1871 they were resorted to, and were the scenes of many sanguinary conflicts.

Barrow is an ancient artificial mound of earth or stone raised over the site of a burial. In Britain barrows were built from 2500 B.C. until the late Saxon period, but the Egyptian are the earliest barrows known, the great pyramids being a spectacular development of the custom of ceremonial burial.

Bar Sinister, a term often improperly used to describe two diagonal lines drawn from left to right, from the sinister chief to the dexter base of an heraldic shield, and supposed to be a mark of illegitimacy. The right term is "bend sinister," and it is not absolutely certain that the illegitimacy interpretation is the correct one.

Bartholomew, Massacre of St., occurred in Paris on the night of Aug. 24, 1572, when over two thousand Huguenots were massacred by order of the Catholic French Court.

Bartizan is a small battlemented turret at the top of a tower.

Basalt Rocks are fine-grained, dark coloured, of igneous origin and occur either as lava currents, as in Mull and Staffa, or as intrusive sheets, like the Edinburgh Castle Rock and Salisbury Craig. One of the most noted examples of basaltic columns is that of the Giant's Causeway in Ireland.

Basanite, a smooth black siliceous mineral, or flinty jasper; a crypto-crystalline quartz, sometimes styled the Lydian Stone. An alloyed metal being rubbed across basanite, the mark of colour left will indicate the nature and depth of the alloy, hence it obtains its name, which signifies, in Greek, "a touchstone."

Base, is a substance which neutralises an acid to form a salt with the formation of water also, but without evolution of hydrogen. A more scientific definition is a substance which dissolves in water to form hydroxyl ions.

Basel, Council of, was the last of the three great Reformation Councils held in 1431–43.

Bashi-Bazouks, name formerly given to irregular troops in the pay of the Turkish sultans. They were a rough but brave class of men.

Basilisk, is a lizard of aquatic habits, with an elevated crest (which it can erect or depress at will) down the centre of its back.

Basques are an old race living in the Pyrenees, with a language of their own, different from all other languages, and noted for its extreme difficulty.

Bas-Relief ("low relief"), a term used in sculpture to denote a class of sculptures the figures of which are only slightly raised from the surface of the stone or clay upon which the design is wrought.

Bass, the fourth or lowest voice in a male voice church choir and therefore the lowest voice in a mixed choir. The term may also be applied to instruments having a lower register than others of their class: *e.g.*, bass clarinet.

Basset horn (= corno di bassetto). An alto form of the clarinet. This instrument is rarely used in modern orchestras.

Bassoon, a bass version of the oboe in which the tube, being 9 ft. long, is bent back on itself for convenience. There is also a double-bass oboe which is called the contra-bassoon.

Bastille, a castle or fortress in Paris, built in the 14th century, and used as a state prison, especially for political offenders. Its bad repute as an instrument of despotism excited the hatred of the populace, who stormed on July 14, 1789, at the beginning of the Revolution, and demolished it.

Bastinado, an oriental punishment, by beating with a pliable rod or cane on the soles of the feet.

Bastion, an earthwork standing out from a rampart, of which it forms a principal part. Usually five-sided, the fifth side opening into the interior of the fortifications. The front face of an ancient Roman bastion was generally convex and semicircular.

Bats. These mammals fly by means of a membrane stretched between each of the long fingers of the hand and between the fifth finger and the body. Another membrane stretches between the legs and the tail. There are twelve British species; namely, the Noctule, Leisler's B., Serotine, Pipistrelle, Long-eared B., Daubenton's B., Natterer's B., Whiskered B., Bechstein's B., Barbastelle, Greater Horseshoe, and Lesser Horseshoe Bats. An interesting and recent discovery is that bats "echo-locate" obstacles by means of supersonic sound waves; this explains their long-admired ability to fly perfectly at night and in dark woods and caves. Bats are mostly insectivorous, catching the insects in their open mouths while flying. The Vampire Bats, feeding exclusively on blood, are confined to tropical America.

Bath, Order of the, believed to have been established by Henry IV. at his coronation in 1399; remodelled in 1725 as a military order; formally instituted in three classes in 1815; civil division added in 1847. In the Order are three classes: G.C.B., or Knight Grand Cross of the Bath; K.C.B., or Knight Commander of the Bath; C.B., or Companion of the Bath. Companionship of the Bath does not carry knighthood nor entitle the holder to the prefix "Sir." The motto of the order is *Tria juncta in uno* (Three joined in one). The insignia for civil and military and the three classes vary. (*See* **Knighthood.**)

Battalion, in the British Army an infantry unit of approximately 850 war strength. Three battalions constitute an infantry brigade, and three brigades a British infantry division. Commanded by a lieutenant-colonel.

Battering Ram, a military apparatus, used in ancient times, mounted on wheels, and composed of a heavy, iron-bound beam, which was impelled with great force upon the walls of a besieged place.

Battlement, a raised wall running along the top of a building, with embrasures through which an enemy could be fired upon. At first solely military, later it was frequently used as an architectural ornamentation.

Battue is the term applied to the practice of employing beaters to force game to a certain point where sportsmen are in waiting with guns.

Bauble, a short stick or wand, surmounted by a representation of a human head, ass-eared, carried by the fools and jesters of olden days.

Bauxite, the chief ore of aluminium. Chemically it is aluminium oxide. Aluminium metal is made industrially by electrolysing purified

bauxite dissolved in fused cryolite. Chief producing areas: Surinam, Br. Guiana, U.S.A., France, Hungary, Indonesia, U.S.S.R., Yugoslavia, Italy.

Bawbee, an old Scots copper coin.

Bayeux Tapestry, a famous tapestry representing the conquest of England by William the Conqueror. It is embroidered on a band of linen 231 ft. long and 20 in. wide in blue, green, red, and yellow, divided into 72 scenes ranging over the whole story of the conquest. Tradition attributed it to William's Queen, Matilda, but it is now believed to be of later origin executed for Bayeux Cathedral by English embroiderers. *See also* **G34 (1)**.

Bayonet, a dagger or small spear fixed at the end of a musket. It takes its name from Bayonne where it was first made about 1650. In 1689 General Mackay invented the socket-bayonet, which allows the gun to be fired with the bayonet fixed.

Beacon, a fire-signal, given from the tops of hills, was much in use in early times. According to Aeschylus, Agamemnon thus signalled the fall of Troy to Mycenæ; and the English signalled the approach of the Spanish Armada.

Beagle, a small hound that tracks by scent, and formerly used for hare hunting.

Bears belong to the Ursidæ family of the Carnivora. They are plantigrade mammals, walking (like man) on the soles of their feet. Found in most parts of the world except Australia. The common Brown Bear was once spread over the whole of Europe; it became extinct in England about the 11th century; 7–8 ft. in length, and stands 3 ft. or more at the shoulder. The Grizzly Bear of N. America is larger, and the coat is shorter and greyer. The Polar Bear is remarkable in having a white coat all the year round; it spends much time in water, and unlike the other bears it is entirely carnivorous. Bear-baiting was made illegal in England in 1835.

Beating the Bounds. (*See* **Bounds.**)

Beaufort Scale of wind force is used to specify numerically the strength of the wind. Since the introduction of anemometers to measure the actual velocity, equivalent values of the ranges in miles per hour at a standard height in the open have been assigned to the Beaufort numbers. *See* **N10.**

Beaver, a genus of mammals of the Rodentia order, with short, scaly ears, and webbed hind feet. Attains a length of from 2½ to 3 ft., and lives in communities where possible, as in North America, constructing dams and habitations. Beavers are found in Russia and Poland. Beaver skins are of considerable commercial value.

Bed of Justice, the cushioned seat occupied by the Kings of France in the parliament chamber, but not used later than 1787, by Louis XVI. at Versailles.

Bedford Level comprises parts of Norfolk, Suffolk, Huntingdon, Northampton, Lincoln, and Cambridge, generally called the Fens, 70 miles long and 20 to 40 miles broad. It was reclaimed and drained in the 17th century by the Earl of Bedford and the Dutch engineer Cornelius Vermuyden.

Bedlam (a corruption of Bethlehem) was a priory in Bishopsgate, afterwards converted into a hospital for lunatics. The asylum was transferred to St. George's Fields, Lambeth, in 1815. The term "bedlamite" came to be applied to any person behaving like a madman.

Bedouins are Arabs who live in tents and are spread over the whole of Northern Africa and Western Asia. They are divided into independent tribes, each governed by its own sheikh. They live on their flocks and herds, rice, etc., and are prone to robbery. Supposed to be the descendants of Ishmael.

Bedrepe, an ancient term signifying the day's work in harvest-time exacted from tenants by their over-lord in the feudal period.

Beech, a deciduous tree belonging to the genus *Fagus* of some eight or nine species found in north temperate regions. The common beech, *F. sylvatica*, is believed to be native to Britain and is one of our finest trees, with massive trunk and smooth, grey bark. Its horizontal branches covered with close foliage, make a deep shade. It is shorter lived than the oak, taking about 200 years to reach full size and then declining. The timber of beech has a variety of uses, *e.g.*, spoons, handles, tools, and chairs.

Bee-eater, name of a family of brilliantly coloured birds closely related to the rollers and kingfishers inhabiting the tropical and sub-tropical parts of Africa, Asia and Europe. The European species successfully nested in Britain for the first time in 1955 and a pair nested in Alderney in 1956. With their long curved beaks they catch insects on the wing, especially bees and butterflies.

Beefeater. (*See* **Yeomen of the Guard.**)

Beelzebub, corruption of Baal or Bel, whom the Philistines worshipped at Ekron. To the Jews he came to be chief of the false gods.

Beeswax, the secretion of the bee, used for the formation of the cells or honey-comb of the hive; when melted it is what is commercially known as yellow wax, white wax being made by bleaching. Being impervious to water, it acts as a good resistant and is an article of much utility.

Beetles (Coleoptera) constitute one of the biggest orders of insects, numbering over 200,000 species. There are two pairs of wings; the hind pair are used for flight, while the front pair are hardened to form a pair of protective covers (elytra). Some beetles have lost the power of flight and then the elytra are joined together.

Behemoth, the name of a semi-mythical spirit in the shape of a large four-footed creature, referred to in the Book of Job.

Bel and the Dragon is the title of certain supplementary chapters to the "Book of Daniel" of an apocryphal character. First appeared in the Septuagint, but the Jewish Church did not accept it as inspired. In 1546 the Council of Trent declared it to be canonical.

Bell, a hollow body of metal used for making sounds. Bells are usually made from bell-metal, an alloy of copper and tin. Small bells used for interior functions are often made of silver, gold, or brass. Ordinary hand-bells are of brass. From the 7th century large bells have been used in England in cathedrals, churches, and monasteries. The greatest bell in the world is the "King of Bells" in the Kremlin at Moscow which weighs about 198 tons, is 20 ft. 7 in. high and 22 ft. 8 in. in diameter. It was cast in 1733, but cracked in the furnace (the broken part weighed 11 tons) and is now preserved as a national treasure. Other large bells in Russia, include the 171-ton one at Krasnogvardersk, near Leningrad, and the one of 110 tons at Moscow. The Great Bell (Great Paul) at St. Paul's, cast in 1881, weighs 16¾ tons, and is the largest in the United Kingdom. Other gigantic bells are the Great Bell at Peking (53 tons); Nanking (22 tons); Cologne Cathedral (25 tons); Big Ben, Westminster (13½ tons); Great Peter, York Minster (10 tons). The Curfew bell is rung in some parts of England to this day, notably at Ripon. The number of changes that can be rung on a peal of bells is the *factorial* of the number of bells. Thus four bells allow 24 and eight bells 40,320.

Belladonna *or* **Deadly Nightshade**, a well-known poisonous wild plant found in Southern Europe and Western Asia. The alkaloid atropine it contains is valuable in medicine, although a large dose is poisonous.

Bell, Book, and Candle. To curse by "bell, book, and candle" was a form of excommunication in the Roman Church ending with the words: "Do to the book, quench the candle, ring the bell."

Ben *or* **Benn**, a Gaelic word signifying mountain or "mountain head." It occurs in many places in the British Isles, as Ben Nevis, Ben Lomond. Takes the form of Pen in Wales and Cornwall.

Benedictine or "Song of the Three Holy Children" from the *Apocrypha*, sung in the Anglican Church at Morning Prayer.

Benedictines are monks and nuns of the Benedictine Order who live under the rule of St. Benedict. They are known as Black Monks because of the colour of their dress. They were introduced into England in the 7th century. The rule is marked by an absence of extravagant

asceticism. The order has always been famous for its learning and its promotion of education. At the dissolution of the monasteries in the reign of Henry VIII. the order had 300 houses.

Benedictus, a canticle used in the morning service of the English Church, and deriving its name from the first word of the Latin verse, *Benedictus*, blessed.

Benefit of Clergy, a privilege allowed to clergymen offenders, exempting them from punishment by the ordinary courts and leaving the bishop's court to deal with them. In 1650 the privilege was extended to all who could prove their ability to read. The system was abolished in 1827.

Benelux. Name given to the economic alliance between Belgium, Holland and Luxemburg. The word is made up from the three names.

Benevolence, a name given to demands made by certain English kings for loans from subjects or corporations. Abolished in 1688.

Benewith Tree, the old name of the honeysuckle on both sides of the Scottish Border.

Bengal Light, a kind of firework composed of nitre, sulphur, and the black sulphide of antimony, in proportions of six, two, and one respectively, giving a blue light.

Benthamism, the philosophy of Jeremy Bentham, the essential principles of which were that the end and aim of human life is happiness, as exemplified in the presence of enjoyment and the absence of pain. Communities and individuals, it taught, should strive after the greatest happiness of the greatest number, the effort to achieve the greatest good for all being accounted in itself the highest morality.

Benzene, a compound of carbon and hydrogen, discovered by Faraday, and the starting-point in the production of aniline dyes and a host of other important organic chemical compounds.

Berbers are the inhabitants of the mountainous parts of Barbary and the northern portion of the Sahara, who are supposed to be the descendants of the aborigines of North Africa. They live mostly in the fastness of the Atlas Mountains and number about 4 million.

Bergamot, an essential oil obtained from the rind of a species of citrus grown chiefly in Calabria, and largely used in perfumery.

Beryl, a mineral, of which the emerald is a grass-green variety. Composed of beryllium and aluminium silicates. The pure mineral is colourless; the colour of most beryl comes from traces of impurities, notably iron and chromium. Otherwise it is yellowish, greenish-yellow, or blue, and is found in veins which traverse granite or gneiss, or embedded in granite, and sometimes in alluvial soil formed from such rocks.

Beryllium *or* **Glucinium**, is a white metal prepared from beryl, and found also in the emerald and other rare minerals. Discovered by Vauquelin in 1797. Copper containing 2 per cent. of beryllium is used for making springs.

Bessemer Process, for making steel depends on the forcing of atmospheric air into molten pig iron to burn out the impurities. (*See* **Steel.**)

Betel, the leaf of an Indian climbing plant, of pungent, narcotic properties. It is destructive to the teeth, and reddens the gums and lips.

Bhang, the Indian name for the hemp plant *Cannabis sativa*, the leaves and seed-capsules of which are chewed or smoked. The potent drug which comes from flowers of the female plant is called hashish in Arabia and marihuana in the United States and Mexico. *See* **P23** (2).

Bible—The Old Testament and the New Testament. The old Testament—the prehistoric portion—consists of 39 books, and is divided into three parts: (1) the Law, (2) the Prophets, (3) Miscellaneous Writings. The Old Testament was written in Hebrew except for parts of Ezra and Daniel, which were in Aramaic. It was not until the 9th century A.D. that a complete Hebrew text was made, the so-called Massoretic text. Before that the main versions were the Greek Alexandrian Septuagent of the 3rd and 4th centuries B.C. and St. Jerome's Latin Vulgate of the 4th century A.D. Portions were translated into the Anglo-Saxon in the 8th century, and the Venerable Bede put the greater part of St. John's gospel into English, but it was not until 1535 that a complete printed English version appeared—the Coverdale Translation. The Authorised Version dates from 1611 in the reign of James I., and because of its beautiful phraseology it has had a lasting appeal. The Revised Version dates from 1885. A new translation of the Bible in the English language of today is in progress; the New Testament is to be published in 1961 and the Old Testament and the Apocrypha later. The finding of the Dead Sea Scrolls (since 1947) has added to our knowledge of Scripture.

Bibliomancy, divination by certain references at hazard to pages, lines, or verses of the Bible, and frequently resorted to in olden times.

Bill of Rights, or Declaration of Rights, was the document setting forth the conditions upon which the British throne was offered to William and Mary in 1688. This was accepted and ultimately became an Act of Parliament.

Birch, a genus of deciduous trees including about 40 species and found only in northern regions. Birches native to Britain, and to Europe generally, are of two species—the silver birch, *Betula pendula*, with its graceful, drooping branches and triangular leaves, and the white birch, *Betula pubescens*, which has erect branches and soft oval leaves. Birch timber is an important plywood timber, the bark is used for tanning leather, and wintergreen oil comes from the bark of black birch, *Betula lenta*, a North American species. The birch is not a long-lived tree, few standing for more than a hundred years. The tallest recorded is at Woburn in Bedfordshire, 102 ft. high.

Birds, or Aves, are, next to mammals, the highest class of animal life. They are vertebrate, warm-blooded, oviparous, are covered with feathers, and possess wings. In construction they vary greatly, according to their classification and their conditions of life. Birds are of three distinct classifications—*Carinatæ*, possessing keeled breast-bones and having power of flight; *Ratitæ*, having raft-like breast-bones, and incapable of flight; and *Archæornithes*, a lizard-tailed sub-class, of which only one species has been known, the extinct archæopteryx, recognised as a "missing link" connecting the birds and reptiles. It is estimated that there are about 120 million land birds breeding in Great Britain, including 10 million each of the chaffinch and blackbird, 7 million each of the starling and robin and about 2 million sparrows. *Bird Arrivals.* The wheatear is usually the first of the migratory birds to return, often reaching Britain at the end of February and always before the middle of March; the sand martin is the first of the "early swallows" to return, followed by the house martin. The first cuckoo arrives about the middle of April, and the whinchat, garden warbler, and sedge warbler during the last week in April. The nightjar, spotted flycatcher, and red-backed shrike are not seen until the first week in May. The swift is among the last to return from Africa and the earliest to depart. *See* **F24** (2), **Z21.**

Birds of Paradise, several species of tropical birds inhabiting the dense forests of New Guinea and neighbouring islands. The male birds are remarkable for their brilliant plumage, long tail feathers, and ruffs on wings and neck, which are displayed to advantage during courtship. Related to the Bower Birds of Australia.

Biretta, a four-cornered head-covering worn by ecclesiastics of the Roman Church and varying in colour according to the rank of the wearer. A cardinal's biretta is red, a bishop's purple, a priest's black.

Bise, a keen dry north wind prevalent in Switzerland and South France.

Bishop is a Christian ecclesiastic, a person consecrated for the spiritual government of an area, a diocese or province, to the spiritual oversight of which he has been appointed (diocesan bishops), or to aid a bishop so appointed (suffragan bishops). In the Church of England there are forty-three diocesan bishops, all nominated by the Crown. Two, Canterbury and York, are archbishops having primacy in the respective provinces. The archbishops of Canterbury and York and the bishops of London, Durham, and Winchester and twenty-one other diocesan bishops in the order of seniority are spiritual peers, and sit in the House of Lords. The (Disestablished) Church of Ireland

has two archbishops and bishops; the (Disestablished) Church of Wales an archbishop and five bishops and the Episcopal Church in Scotland six bishops. There are over 120 Anglican bishops of dioceses overseas, including Africa, Australia, Canada, India, New Zealand, the West Indies, and elsewhere.

Bismuth, a brittle grey-white metal with a pink tinge. It is readily fusible, melting at 264° C. and boiling at about 1420° C. Wood's metal, an alloy with one of the lowest melting points (under 150° F., so that a spoon made of it will melt when placed in a cup of hot tea), contains four parts bismuth, two parts lead, one part tin, one part cadmium.

Bison, a genus of wild cattle, distinguished from the ox by its shorter, wider skull, beard under the chin, high forequarters, and, in winter, a great mane of woolly hair covering head and forequarters. There are two species, the European and the American bison, both now protected in game preserves.

Bittern, a bird of the heron genus, with long, loose plumage on the front and sides of the neck. It is a solitary bird inhabiting marshes, but rare in Britain.

Bivalves, a term applied to shell-fish whose shell consists of two valves, lying one on each side of the body, such as mussels, oysters, and cockles.

Blackbird, or Merle, a member of the Thrush family, a familiar song bird in Britain. Male is all-black with orange bill; female is mottled brown with brown bill.

Blackcock and Greyhen (as the female is called) are closely related to the Capercaillies but smaller. They nest on the ground and prefer wooded country to open moors. Found in northern half of northern hemisphere. Perform excited courtship dances; the male is a handsome blue-black bird with white undertail, the female dark brown mottled.

Black Death, a fierce epidemic of plague, which carried off thousands all over Europe in the 14th century. It raged in England and wiped out whole villages. The English Statute of Labourers (*see under* **Labourers, Statute**) was a measure to direct labour and regulate wages in an attempt to deal with the situation.

Black Hole of Calcutta was the place where a number of English were confined in 1756 by order of Suraj-ud-daula. Into a noisome space, about 20 ft. square, 146 persons were driven, and only 23 were found alive the next morning.

Black-letter, the Old English or Gothic type first used in printing blocks.

Black Woodpecker (*Dryocopus martius*), a large, black bird about the size of a rook, with slightly crested scarlet crown, found in many parts of Europe.

Bladderwort, a submerged water plant which traps water-fleas and other small animals in bladders borne upon the finely-divided leaves.

Blende *or* **Zinc Blende** is zinc sulphide, the principal zinc ore Pitchblende is an important ore for its uranium and radium content.

Blenny, a group of marine fishes with spiny rays, part of the fin running along the back. Several species are found around the British coast.

Blind-Worm *or* **Slow-Worm,** is a limbless lizard. Found in most parts of Europe, non-venomous.

Bloody Assizes, the assizes, conducted in 1685 by George Jeffreys, Lord Chief Justice, at which participants in the Duke of Monmouth's rebellion against King James II. were tried. They were marked by relentless cruelty

Bluebird, a migratory bird of North America, deriving its name from its deep blue plumage. It is one of the few song birds of America, and familiar in the woods from early spring to November. The bluebird was used as the symbol of happiness by Maeterlinck in his play *The Blue Bird.*

Blue Monday, the Monday immediately preceding Lent, when in the 16th century many churches were bedecked internally with hangings of blue.

Blue Peter, a blue flag with a white square in the centre, is hoisted 24 hours before a ship leaves harbour (the letter P in the alphabet of the International Code of Signals).

Blue Ribbon, a term in general use to denote the highest honour or prize attainable in any field or competition. Thus the Derby is the blue ribbon of the turf. The expression is derived from the highest Order of Knighthood in the gift of the British Crown, the insignia of which is a garter of blue velvet.

Blue Stocking, a term used to describe a learned or literary woman, particularly if pedantic and undomesticated. It is said that the term derives from the Bas-Bleu club of Paris, which was attended by the literary savantes of the 17th century. In England a similar literary club was formed about 1780, whose members were distinguished by their blue stockings.

" Blue " Sun, Moon, etc., a phenomenon caused by the scattering of sunlight by transparent particles suspended in the atmosphere, the effect being that blue light is transmitted and red light extinguished to direct vision. The dust from the Krakatoa eruption in 1883 and the drifting layer of smoke from the forest fires in Alberta, Canada, in September 1950 gave rise to " blue " moons and suns, phenomena sufficiently rare to be described as occurring " once in a blue moon." In the cold climatic conditions of the Pamirs and the far north, vegetation is said to look " blue " on account of the rays of high calorific value (red, yellow, green) being absorbed, while only the blue and violet are transmitted. It was Tyndall who first explained the blue colour of the sky.

Blunderbuss, a short, bell-mouthed musket with wide bore, capable of firing many balls at once, and much used in the 17th century.

Boa, a term applied to a family of snakes of large size, some attaining a length of 30 ft. They are not poisonous, but kill their prey by crushing —constriction—hence the name "boa constrictor." They occur both in the Old World and the New, but are more abundant in the latter. Most Boas retain the eggs within the body until young are fully developed, whereas the Pythons almost all lay leather-shelled eggs.

Boar, or Wild Hog, an animal largely distributed over the forest regions of Europe, Asia, Africa, and South America. It has a longer snout and shorter ears than its descendant the domestic hog, and is provided with tusks. Having to forage for itself, it is a more active and intelligent animal than the pig of the sty, and offers good sport to the hunter.

Boat, an open vessel, propelled by oars or sails, or both. The boats of a ship of war are the launch, barge, pinnace, yawl, cutters, jolly boat, and gig; of a merchant vessel, the launch, skiff, jolly boat or yawl, stern boat, quarter-boat, and captain's gig. Every British passenger ship is compelled to carry a launch and proper equipment of lifeboats.

Bode's Law, a numerical relationship formulated by Bode in 1772, which states that the relative mean distances of the planets from the sun are found by adding 4 to each of the terms 0, 3, 6, 12, 24, 48, 96. The actual mean distances (in millions of miles) are: Mercury, 36; Venus, 67·2; Earth, 92·9; Mars, 141·6; Jupiter, 483·3; Saturn, 886·0; Uranus, 1782·8. The gap between Mars and Jupiter caused Bode to predict the existence of a planet there, which was later confirmed by the discovery of Ceres and other minor planets. The law breaks down, however, for Neptune and Pluto.

Bodleian Library, the official library of Oxford University, named after Sir Thomas Bodley, who began in 1598 to restore and add to its treasures. Other notable donors have been Archbishop Laud, John Selden, and Edward Malone. In the 19th century the Ratcliffe Library became its reading-room. It has been enlarged from time to time and in 1947 a new wing was opened by the King and Queen. Under the Copyright Act of 1911 it is entitled to a copy of every book published in the United Kingdom.

Boer War, lasted from Oct. 11, 1899, when the Boers invaded Natal, to May 31, 1902, when the Peace Treaty was signed at Vereeniging. At first the operations of the British troops in Cape Colony were unsuccessful and disastrous reverses were sustained. Lord Roberts was then sent out as Commander-in-Chief, with Lord Kitchener as Chief-of-Staff, and from February, 1900, when Kimberley was relieved and Cronje was compelled to surrender and Ladysmith and Mafeking were relieved, the struggle was practically over.

Boiling-point is the temperature at which a liquid

boils. At that point the pressure of the vapour is equal to the pressure of the atmosphere. Under increased pressure the b. p. rises and under less pressure, as on the top of a mountain, it is lower. As represented on the Centigrade scale the b. p. of water is 100°; alcohol 78·4°; and ether, 35·6°. On the Fahrenheit scale, the b. p. of distilled water is 212°. Boiling points are given for a standard pressure (760 millimetres of mercury).

Bolshevism, the doctrine professed by the left wing of the old Russian Social Democratic Party. The name is derived from the fact that at a conference of the Party held in London in 1903, a majority ("Bolsheviki") secured the acceptance of views urged by their leader Nicolai Lenin. The minority ("Mensheviki") practically withdrew from control of the Party's operations. It was the Revolutionary majority which under Lenin took over the government of Russia in 1917, establishing a communistic centralised control of economic production and distribution, based on the Soviets—the social institutions evolved by the workmen, soldiers, and peasants.

Book of Common Prayer contains the services of the Church of England, and is in the main the same as that of Edward VI., with modifications introduced at later dates.

Book of the Dead, a collection of ancient Egyptian spells for recitation in tombs, containing reference to judgment after death. *See* **G17 (1).**

Books were originally formed, it is supposed, from beech-bark. At first, collected writings were produced in the form of rolls; then in volumes; and when the art of printing spread, they began to be issued in bindings upon the principle still in vogue. The earlier books were massively bound, with metal clasps and bands, and samples centuries old survive to show the durability of their workmanship. Books are technically described, according to their sizes, as 4to, 8vo, 16mo (*quarto, octavo, duodecimo*), the names indicating the number of folds in a sheet. For Standard Sizes of British Books *see* **N13.**

Books, Classification of. All libraries are classified to facilitate reference, but the favourite system is the Dewey Decimal System, which divides the whole field of knowledge into ten Main Classes: General Works; Philosophy; Religion; Sociology; Philology; Natural Science; Useful Arts and Applied Science; Fine Arts; Literature; History (including geography and travel and biography). Each of these Main Classes is again subdivided into ten main divisions. As an example: the main class of Sociology receives the number 300. This range 300 to 400 (the next main class) is graduated into tens, and Economics is 330. The range 330 to 340 is again graduated, and the subject of Labour and Capital is 331. This process is carried on by decimals so that 331·2 deals with Remuneration for Work, 331·22 with Wage Scales, and 331·225 with Extra Pay.

Boomerang, a weapon used by the Australian aborigines, made of wood, in the form of a parabola, one side flat, the other round. When thrown forward into the air, it whirls round and rebounds behind the point from which it was projected. Used both as a missile of war and for killing game.

Borax (**Sodium Pyroborate**) is a white, soluble, crystalline salt. It is widely and diversely used, *e.g.*, as a mild antiseptic, in glazing pottery, in soldering, in the making of pyrex glass, as a cleansing agent and sometimes as a food preservative. Borax occurs naturally in the salt lakes of Tibet, where it is called tincal, in California (Borax Lake, Death Valley), and elsewhere.

Borough English, an English custom still obtaining in a few places, whereby, in default of a testamentary disposition to the contrary, landed property descends to the youngest son in exclusion of elder brothers. The term is obsolete since Jan. 1, 1926.

Borstal, an institution where young delinquents between 16 and 23 on conviction may be sent for detention and reform by a court of quarter sessions or assize. The first was opened in 1902 at the village of Borstal, near Rochester in Kent. Administered by the Prison Commission.

Boston Tea Party, an incident which occurred on Dec. 16, 1773, on board some tea-ships in Boston Harbour. High taxation imposed by the British Parliament under George III. had caused bitter feelings, and instigated by popular meetings, a party of citizens, disguised as Indians, boarded the tea-ships and threw the tea overboard. This incident was a prelude to the American War of Independence (1775–83).

Boulevard, a French term given originally to the ramparts of a fortified city but now applied generally to any wide and busy thoroughfare planted with trees. Particularly famous, of course, are the boulevards of Paris.

Bounds Beating, an old Anglo-Saxon custom. The parish clergyman and officials go round the parish boundaries accompanied by boys, who beat the boundary stones with long sticks of willow. The ceremony takes place on the Rogation days preceding Ascension Day.

Bow, an instrument for propelling arrows, and, in the days when it was a weapon of war, was usually made of yew or ash, and was about 6 ft. long, with an arrow 3 ft. long. It was the weapon with which Crécy, Poitiers, and Agincourt were won. The cross-bow was Italian and was adopted in France, but did not become popular in Britain.

Bow Bells is the peal of the London church of St. Mary-le-Bow, Cheapside, within sound of which one must be born to be entitled to be called a "cockney."

Bowdlerize, to expurgate a book. Derived from Thomas Bowdler (1754–1825), the editor of the Family Shakespeare, in which "those words and expressions are omitted which cannot with propriety be read aloud in a family." He treated Gibbon's *History of the Decline and Fall of the Roman Empire* in the same way, omitting "all passages of an irreligious and immoral tendency." Such prudery met with ridicule and hence the words "bowdlerism," "bowdlerist," etc.

Bower Bird, native to Australia and New Guinea and related to the Bird of Paradise, though less remarkable in appearance. In the mating season the male builds a "bower" of sticks and grasses for courtship displays and as a playground. The Gardener Bower Bird of Papua makes a lawn in front of his bower and adorns it with bright coloured pebbles and flowers which are replaced as they wither. The female builds her nest away from the bower.

Boycott, a term used in connection with a person that the general body of people, or a party or society, refuse to have dealings with. Originally used when Captain Boycott (1832–97) was made the victim of a conspiracy by the Irish Land League which prevented him making any purchases or holding any social intercourse in his district. He had incurred the League's hostility by a number of evictions.

Brahmin, member of the highest Hindu caste. *See* **Caste** and **Hinduism.**

Brains Trust. The original term was the name of a group of experts appointed by President Roosevelt to advise him upon measures (embodied in the "New Deal" programme, 1933) to foster the industrial recovery of the United States after the economic crisis of 1929 and the following years. Also the name given to the B.B.C. programme introduced in 1941.

Brandywine, Battle of, fought between the British and the Americans in 1777 during the American War of Independence, resulting in victory for the former.

Brass is a compound metal containing two-thirds of copper to one-third of zinc, and while being harder than copper, is more easily worked.

Brass-wind, a collective term for those instruments in an orchestra which are made of brass (or other metal) and which are sounded by blowing so as to cause the lips to vibrate within a cup- or funnel-shaped mouthpiece. The shape of the mouthpiece affects the tone, *e.g.*, cornet, trumpet, horn, trombone, tuba.

Breadfruit Tree (*Artocarpus altilis*), a native of the South Sea Islands; the fruits are a brownish green, about the size of a melon, and contain a white pulpy substance which is roasted before being eaten. The tree grows 40 ft. or more. Captain Bligh's ship *Bounty* was on a voyage to Jamaica carrying a cargo of 1,000 breadfruit trees when the mutiny occurred.

Bretton Woods. In order to achieve co-operation on money matters, stable exchanges and expansion of international trade, forty-four nations met in July, 1944, at Bretton Woods, U.S.A. They recommended the setting up of an International Monetary Fund and an International Bank to assist reconstruction, especially in countries devastated by war. Under the American Loan Agreement, Britain was bound to participate, but Russia did not sign.

Brevet is a special commission entitling an officer to a rank in the army higher than that which he really holds in his own regiment, without increase of pay.

Breviary (Lat. *breviarium* = abridgment), the short prayer-book of the Roman Catholic Church which gives the Divine Office, *i.e.*, the canonical hours or services. The directions for Mass are in the Missal. The modern Roman breviary is a reformed version of the 11th-century breviary and was produced by Pope Pius V. in 1568 in response to a decree of the Council of Trent. All Roman Catholic priests are required to recite the whole of the breviary services allotted for each day. *See also* **Matins.**

Brick, a moulded block of clay, either burnt in a kiln or sun-dried, used for building. All the ancient nations made bricks, at first only baking them in the sun, and afterwards by means of fire. The Israelites were employed in brick-making during their captivity in Egypt. The Romans used bricks for all ordinary purposes, and introduced them into England. In these days brick-making is mainly done by machinery —digging the clay, grinding, screening tempering (pugging), moulding, drying, burning (firing). The standard size, proved by centuries of experience to be the easiest to handle and the most economical, is approx. 9 in. × 4½ in. × 3 in. The processes of tile-making are similar. A plain tile is 10½ in. × 6½ in. × ⅜–⅝ in. Many varieties of bricks and tiles are produced for different purposes.

Bridewell, a house of correction standing till 1864 in London near Blackfriars Bridge. Originally a palace built by Henry VIII. So called from St. Bride's (or Bridget's) Well near by.

Bridges are structures for continuing a road, railway, or canal across a river, valley, ravine, or a road or railway at a lower level. From early times bridges were made of timber, stone, or brick, and it was not until the 19th century that wrought- and cast-iron were used. Today the materials mostly used are steel and reinforced concrete. Among the most famous of ancient bridges is that of S. Angelo at Rome, built by Hadrian as the Pons Aelius, A.D. 134. The first stone bridge across the Thames was completed in 1209, and upon it were a number of timber houses; this old London Bridge, as it was called, stood until the 18th century. The Rialto bridge at Venice dates from 1588. The Ponte Santa Trinita at Florence, one of the finest Renaissance bridges and deemed the most beautiful in the world, was destroyed by German mines in 1944 but has now been reconstructed just as it was before. The first cast-iron bridge was Telford's famous Menai suspension bridge with a span of 580 ft., built 1819–26, which lasted until 1940, when it was completely reconstructed. Another example of Britain's supremacy in constructional ironwork was Robert Stephenson's tubular bridge across the Menai Straits, the prototype of all modern plate girder railway bridges. Waterloo bridge, first opened in 1815, has been rebuilt (opened in 1945) and is a fine example of a reinforced-concrete bridge. Other famous bridges are the Niagara (suspension), Forth bridge (cantilever), London Tower bridge (suspension), Tay bridge in Scotland, Victoria Jubilee bridge across the St. Lawrence at Montreal (an open steel structure), Golden Gate suspension bridge, San Francisco (the world's longest single-span bridge), Sydney Harbour bridge, Triborough bridge, New York, Lower Zambesi bridge (longest in the world), Storstrom bridge in Denmark (longest in Europe), Howrah bridge at Calcutta, with the third largest cantilever span in the world, the Volta bridge of Ghana and the Auckland Harbour bridge, both built in recent years. Work started in 1958 on the Forth road bridge, which will have the largest single-span in Europe. (*See also* Bailey Bridges.)

Britannia Metal, an alloy of tin, antimony, and copper, harder than pure tin, corrosion-resistant, and used for teapots, and jugs (often electroplated).

British Association for the Advancement of Science, The, was founded in 1831 by a group of British scientists under the leadership of Charles Babbage (1792–1871) to stimulate scientific inquiry and promote research in the interest of the nation. Its meetings are held annually in different cities of the United Kingdom. It is divided into sections which include the chief physical and biological sciences, economics, anthropology and archæology, psychology and education, engineering forestry, agriculture, and there is also a division for the social and international relations of science. The President each year is one of the most eminent scientists or public men of the time. Sir George Thomson, F.R.S., succeeded Sir James Gray in 1960. New and wider programmes of activity were inaugurated in 1958, including the founding of the Junior B.A. and the setting up of a study group to examine the general education of the scientist through his school and university career. Membership is open to laymen as well as scientists, and particulars can be obtained from the Secretary, Burlington House, Piccadilly, W.1.

British Broadcasting Corporation is a public corporation, acting as trustee for the nation, under Government control and responsible to Parliament. Its object is to disseminate information, to educate and entertain the 14,583,256 (1959) persons holding licences for sound and television broadcasting. The Home Service, organised on a regional basis, broadcasts on 330 metres (London), the alternative Light Programme on 1,500 and 247 metres, Network Three and the Third Programme, on 464 and 194 metres. The European Services broadcast news bulletins and programmes in foreign languages to continental audiences, and the Overseas Services cater for listeners in all parts of the world. The present charter came into force in 1952 and expires in 1962. Nine governors are responsible for policy: Sir Arthur fforde succeeded as Chairman in 1957, and Mr. Hugh Carleton Greene as Director-General at the end of 1959.

British Council, The, founded in 1934 and granted a Royal Charter in 1940, exists to promote a wider knowledge overseas of the United Kingdom and the English language and to develop closer cultural relations with other countries. Its funds are voted by Parliament. It has staff in many Commonwealth and foreign countries. In the U.K. it arranges study programmes for visitors from overseas and services for overseas students, particularly those from the Colonies. The amount of public money allocated to the British Council for 1959–60 was £5,308,150. Headquarters: 65 Davies Street, London, W.1.

British Museum, was created by an Act of Parliament in 1753, when the Sir Hans Sloane collection, which the British Government had acquired for £20,000, was added to the Cottonian Library and the Harleian Manuscripts. It was opened to the public in 1759 at Montagu House, Bloomsbury. The acquisition of the library of George III. (now known as the King's Library) in 1823 made larger premises necessary, and the present building in Great Russell Street was completed in 1847 from designs by Sir Robert Smirke. The great domed Reading Room was opened in 1857, and the Natural History Department was transferred to South Kensington in the eighties. As a museum it is perhaps the most famous in the world, since, apart from its colossal library of books and manuscripts, it has many priceless collections of sculptures, antiquities, prints and drawings, coins and medals. Under the Copyright Acts the British Museum has the right to receive *gratis* a copy of every book published in the United Kingdom. The British Museum Reading Room contains original sources, books, and periodicals which cannot be found elsewhere. Because of necessarily limited accommodation the use of the room is restricted to those who require a wider range of books on the subject of their study

than can be found in other libraries. Those who desire to be admitted to the Reading Room must apply in writing to The Director, British Museum, London, W.C.1.

British Railways. The name under which the railways of Britain were unified on January 1, 1948. Instead of the former four main railway systems six regions were formed: London Midland region (former L.M.S.R.) Western (former G.W.R.), Southern (formerly S.R.), Eastern (southern area of former L.N.E.R.), N.E. region (N.E. of former L.N.E.R.), Scottish region (Scottish system of the former L.M.S.R. and L.N.E.R.). The new (1956) badge of British Railways shows the British lion holding between its paws a silver locomotive wheel. On an heraldic crown of gold are arranged the rose (for England), the thistle (for Scotland), the leek (for Wales), and the oak-leaf (for all Great Britain).

Brocken-spectre or Glory. The series of coloured rings which an observer sees around the shadow of his own head (or an aeroplane in which he is travelling) as cast upon a bank of mist or thin cloud. This effect is produced by reflection and refraction of sunlight in minute water-droplets in the air just as in a rainbow.

Bronze is primarily an alloy of copper and tin, and was one of the earliest alloys known, the Bronze Age in the evolution of tool-using man coming between the Stone Age and the Iron Age. Some modern bronzes contain zinc or lead also, and a trace of phosphorus is present in "phosphor-bronze."

Bubble Chamber. An instrument recently devised for recording quickly and accurately on photographic film the motion of fast atomic particles in accelerating machines. The technique is based on the original "Wilson cloud chamber" using liquid hydrogen. The passage of an atomic particle is marked by a trail of very small bubbles. *See* **F66** (2).

Bucephalus, Alexander the Great's celebrated war-horse, whose memory his owner perpetuated by building the town Bucephala.

Buckingham Palace, London residence of British sovereigns since 1837. Originally built for the Duke of Buckingham (1703); bought by George III. in 1762 and remodelled by Nash 1825–36. Considerable extensions have since been made.

Buddhism, one of the great Oriental religions which arose in India in the 6th and 5th centuries B.C. as a development of, and also as a protest against, the prevailing Hindu religion. Buddha (Sanskrit = enlightened one) was the name given to Siddharta Gautama (b. *c.* 560 B.C.), whose people were rulers of a territory in N.E. India. Buddhism lost its hold in India but spread to other parts of Asia—to Ceylon, Nepal, Tibet, Mongolia, Indo-China, Siam, China, Korea, and Japan. The teaching of Buddha accepts unhappiness as the lot of man. Only by renunciation of all desire can tension be released and suffering ended. *Nirvana*—the aspiration of all Buddhists—is the state of mind reached when the self ceases to matter and becomes absorbed in the Great Self (left undefined by Buddha); a state which had been described as "bliss unspeakable." The goal is reached by way of meditation and self-discipline. This teaching is known as the Four Noble Truths. There is no caste in Buddhism. Researches of recent years have brought to light much that has been obscure and, in its more modern phases, Buddhism has been freed of much of its superstitions, its idolatrous practices and its Vedic gods. It remains in its purity a gentle creed in which renunciation and kindliness are leading elements. Today Buddhism is showing itself as a great unifying force between peoples of different races and cultures.

Buntings, name of a group of finches, seed-eating birds, usually found in open country. The Yellowhammer, Reed Bunting, Corn Bunting, and Cirl Bunting are resident in Britain; the Snow Bunting (which breeds in small numbers in Scotland) and Lapland Bunting are regular winter visitors, and the Ortolan is among the rare visitors.

Busby, a military head-dress of fur. In Great Britain busbies are of two kinds: the fur *busby* worn by the Hussars and the *bearskin* busby, introduced in 1832 and properly called "bearskin," worn by the Guards. The fur of the bearskin comes from the belly of the bear (a Russian bear or a Canadian bear).

C

Caaba. *See* **Kaaba.**

Cabal, the name given to the unpopular Ministry of Charles II.'s time. The initials of the ministers—Clifford, Ashley, Buckingham, Arlington, and Lauderdale—composed the word.

Cabinet. *See* **C8** (1), **36.**

Cable is the rope or chain that is attached to a ship's anchor. Chain cables are now in general use except for very deep waters. A cable's length is 100 fathoms (200 yards).

Cacao is an evergreen tree, from 15 to 20 ft. high, growing abundantly in tropical America, West Africa, the West Indies, Ceylon, etc., yielding seeds, called cocoa beans, from which cocoa and chocolate are manufactured. The specific name of the cacao tree of commerce is *Theobroma cacao*, whose original home was tropical America. The fruit is 7–10 in. long, hard and ridged; inside are the beans, which are covered with a reddish-brown skin. The trees mature at five to eight years and produce two crops a year.

Cachalot, or sperm-whale, is a cetacean which lives in warmer waters, migrating to colder regions in the summer months. Can reach length of 60 ft., female is only half the size of male. Usually found in schools, often several hundred strong.

Cachet, Lettre de, was a private letter of State signed by the King, much in use in France up to the time of the Revolution, for consigning troublesome people to prison without trial.

Cactus, a family of flowering plants numbering about a thousand species adapted to living in very dry situations. The stem is usually fleshy, being composed of succulent tissue, remarkably retentive of water; commonly equipped with sharp thorns which deter animals from eating them. The roots are generally very long, tapping soil water over large area; a "prickly pear" cactus may have roots covering a circular area 25 ft. or more in diameter. The leaves are commonly insignificant or absent, and the stem takes over the photosynthetic leaf function and becomes accordingly flattened to expose greater area to sunlight and air. In some kinds of cactus (*e.g. Echinocactus*) the stem is shaped almost like a sea-urchin. Gardeners propagate cacti largely by cuttings.

Cadenza, originally a passage in which the singer or solo instrumentalist was free to display his virtuosity as he thought fit. This led to such abuse that composers began writing their own cadenzas, thus ensuring continuity and coherence while still permitting the soloist to exhibit his skill.

Cæsium, an element resembling rubidium and potassium, discovered by Bunsen and Kirchhoff in 1860. It was the first element whose existence was discovered spectroscopically.

Caffeine, a highly stimulative alkaloid found in coffee (1½%) and tea (3%). Pure caffeine crystallises in yellow silky crystals; can be prepared by extracting tea dust, or synthesized from uric acid.

Caique, a long, narrow boat peculiar to the Bosphorus, and usually propelled by oars (from two to sixteen in number), and sometimes with sail.

Calcium, a silvery-white metallic element. It melts at 810° C. and is very reactive. It was discovered by Sir Humphry Davy in 1808, but not until 1898 was it obtained pure, by Moissan. Does not occur as metal in nature, but calcium compounds make up a large part of the earth's crust. Most important calcium minerals are marble, limestone, chalk (all three are, chemically, calcium carbonate); dolomite, which is the double carbonate of calcium and magnesium; gypsum, a hydrated calcium sulphate; calcium phosphate and calcium fluoride. Igneous rocks contain much calcium silicate.

Calculating machines are inventions to relieve men and women of the tedium of long routine or involved computations. The calculating machine seems to date from 1642, when Pascal constructed one which could be used for addition and subtraction. General interest was lacking, however, and almost two hundred and fifty

years elapsed before Ohdner in Sweden produced the first numerical arithmetical machines of the type now in general use. Before very long the electric motor replaced the hand in providing the motive power, and so the electric calculating machine was invented. But at all stages of any calculation on hand-operated or electric machines human operators have to supply them with numbers. The principal feature of the more modern machines is that they are automatic; that is, once a sequence of an arithmetical operation has been decided, and instructions given to the machine in suitable form, such as holes punched into cards or tape, or in some other way, the machine carries out its work without further human intervention. In some calculations these machines frequently give the impression that they are "thinking," or "choosing" a way to carry out the calculations as quickly as possible. But even in such cases the criteria for judgment are actually contained in the initial instructions. The idea of automatic computation by machinery is due to the English mathematician Charles Babbage (1792–1871). He made a small machine of this type, based on the idea of the Jacquard loom for lace-making. He next planned, but never completed, two separate automatic machines, a "difference engine" to help in making mathematical tables, and an "analytical engine," which was to be a general-purpose, programme-controlled, machine possessing all the features of modern calculating machines. But Babbage's inventions were designed to be operated mechanically; it was left to the electronic engineers of the 20th century to bring Babbage's ideas to full fruition. The next important step was taken in 1937, when Aiken of Harvard started to construct, and subsequently completed, the first of the electronic machines. In these electricity is conducted either through an evacuated space, or a gas, or a semi-conductor. All calculating machines are of the "Analogue" or "Digital" types. In the analogue type, numbers are represented by physical quantities, for example, electric currents, of which the numbers themselves are the measures. The most important of this class is the Differential Analyser invented by Vannever Bush of America. In the digital machines the numbers are stored in it, and are represented by discrete objects, such as the teeth of a gear-wheel. Most of the important modern machines are of the digital variety. Almost all the ideas underlying the more advanced of these machines can be found in a remarkable mathematical paper published in 1936 by Turing of Manchester. Scientists, engineers, businessmen, administrators, and the fighting services need, and are making considerable use of, these machines. Problems hitherto considered intractable are receiving renewed consideration in view of the possibility of using machines for the numerical calculations required. The electronic computer marks a great advance, and the world is, perhaps, at the threshold of a new era of science, in connection with which the invention of the modern calculating machine may be as important to the world as was that of the Hindu-Arabic numerals to the Middle Ages. *See* **F54–57**.

Calendar, a collection of tables showing the days and months of the year, its astronomical recurrences, chronological references, etc. The Julian Calendar, with its leap year, introduced by Julius Cæsar, fixed the average length of the year at 365¼ days, which was about 11 minutes too long (the earth completes its orbit in 365 days 5 hours 48 minutes 46 seconds of mean solar time). The cumulative error was rectified by the Gregorian Calendar, introduced in Italy in 1582, whereby century years do not count as leap years unless divisible by 400. This is the rule we now follow. England did not adopt the reformed calendar until 1752, when she found herself 11 days behind the Continent. In the world calendar, advocated by the World Calendar Association, the year is divided into four equal quarters of 91 days, leaving one day over in normal years and two days in leap years. Each quarter is divided into three months of 31, 30, and 30 days respectively and therefore contains exactly 13 weeks, beginning with a Sunday and ending with a Saturday. The days left over are extra-calendar days. For instance, the extra day at the end of each year would be known as Worldsday and the extra day in leap years, coming between the first and second halves of the year, would be known as Leapyear Day. Both these extra days would be world holidays.

Calends, the first day of the month in the Roman calendar, when interest fell due, and proclamations as to the order of days were made.

Calorie. Unit of quantity of heat. The "small" or fundamental calorie is the amount of heat required to raise the temperature of 1 gram of water from 15° to 16° C. This is the gram-calorie used in physics and chemistry. The large Calorie (written with a capital C), commonly used in nutritional connotations, is equal to 1000 small calories and is defined as $\frac{1}{180}$ of the heat required to raise the temperature of one pound of water from 32° to 212° F. The daily energy output of an active man is said to be equivalent to about 3000 Calories. *See also* **P39**(2).

Calotype, a wet-plate photographic process invented by H. Fox Talbot about 1840.

Calumet, a sacred decorated reed tobacco pipe used as a symbol of peace or war by the Indians of North America, the bowl being composed of soap stone, and the tube, which is long, being decked with feathers. To accept the calumet when offered is to be friendly, to reject it is to proclaim enmity. There is also a distinctive calumet of war used only on a declaration of war between tribes.

Calypso, West Indian song in the form of a doggerel lampoon composed spontaneously and sung to a guitar.

Cambridge University had a sufficiently good teaching reputation to attract Oxford students in 1209, when lectures at their own university were suspended. In 1226 it had a Chancellor who was recognised by King and Pope. The first college to be founded was Peterhouse in 1284. The university was reorganised and granted a Charter of Incorporation by an act of Elizabeth in 1571. The colleges with their dates of foundation are Christ's (1505), Clare (1326), Corpus Christi (1352), Downing (1800), Emmanuel (1584), Gonville and Caius (1348), Jesus (1496), King's (1441), Magdalene (1542), Pembroke (1347), Peterhouse (1284), Queens' (1448), St. Catherine's (1473), St. John's (1511), Selwyn (1882), Sidney Sussex (1596), Trinity (1546), Trinity Hall (1350), Fitzwilliam House (non-collegiate students) (1869) and four women's colleges: Girton (1869), Newnham (1875), New Hall (1954), and Hughes Hall (formerly Cambridge T.C.) (1885).

Camel, a large ruminant quadruped, inhabiting Asia and Africa, where it is largely used as a beast of burden. There are two species—the Arabian camel or dromedary, with only one hump; and the Bactrian, or double-humped camel. There are no wild dromedaries, and the only wild bactrians occur in the Gobi Desert. The camel is able to go for long periods without water, not, as was formerly believed, because it stored water in its hump, but because of the unique mechanism of its physiology which enables it to conserve water at the expense of not sweating until 104° F. is reached.

Camisards, a French Protestant party of the early 18th century which originated in the Cevennes and resorted to arms in support of its faith.

Campaniles, or bell-towers are usually detached from their parent church, but not always. The most famous are in Italy, and are lofty and elaborate structures. Giotto's tower at Florence, adjoining the cathedral of Santa Maria del Fiore, is architecturally the finest in the world. Other famous campaniles of Italy are those of Cremona (395 ft. high) and Pisa (the leaning tower). The magnificent pointed campanile of St. Mark's, Venice, which collapsed in 1902 and has since been rebuilt in its original form, was begun n 902. Campaniles as separate structures are seldom found in Great Britain: the finest is that of the Westminster Roman Catholic Cathedral. The bell-turrets of St. Paul's in London and St. Peter's at Rome are only a form of campanile.

Campus Martius was a large plain used by the ancient Romans as a military camping ground. It was situated between the Quirinal and Capi-

toline hills, and is to-day entirely built over and forms the heart of modern Rome.

Canal, an artificial watercourse used for navigation which changes its level by means of locks. Some 2,400 m. are in use in Gt. Britain, the English network being based on the four great estuaries Mersey, Humber, Severn, and Thames.

Canary, a light, sweet wine from the Canaries and chief export until the grape blight of 1853. Much consumed in Britain from Tudor to Georgian times.

Candela, unit of luminous intensity, replacing the former *international candle* as standard. So defined that the brightness of a total radiator, or black body, at the temperature of solidification of molten platinum is 60 candelas per sq. cm.

Candlemas, an English and Roman Church festival in celebration of the Purification of the Virgin when she presented the infant Jesus in the Temple and deriving its name from the great show of candles made on the day (February 2) in the Roman celebrations.

Canon, a term applied to signify a recognised rule for the guide of conduct in matters legal, ecclesiastical, and artistic, or an authoritative ordinance: thus we have Canonical Scriptures, Canon Law, etc. A Canon is also a dignitary of the Church, usually a member of a cathedral chapter in the Anglican communion, or in the Roman Church a member of an order standing between regular monks and secular clergy.

Canonical Hours were seven in number in the Western Church; Matins and Lauds, before dawn; Prime, early morning service; Terce, 9 a.m.; Sext, noon; Nones 3 p.m.; Vespers, 4 p.m.; Compline, bed-time.

Canonisation, the entering of one of the faithful departed on the list of saints of the Roman Catholic Church, after proof of purity and distinction of life has been accepted. This having been done, a day is named for the future keeping of the anniversary of the saint's death, and thenceforward appears in the Church Calendar. Beatification, by which a person is called blessed, is usually followed by canonisation, but not necessarily.

Cantata, originally a long piece for solo voice, *i.e.*, the vocal counterpart of a sonata. The term is now used to cover a small oratorio.

Canticles, the name given to the scriptural passages from the Bible sung by the congregation in the various Christian liturgies. They are the *Benedicite*, *Benedictus*, *Magnificat*, *Nunc Dimittis*.

Cap, literally any head-covering article of dress. The "Cap of Maintenance" is carried before the Sovereign at the Coronation, and is used symbolically in heraldry.

Capercaillie, the largest and most handsome of the grouse family, found in the Scottish highlands and the pine forests and mountainous regions of Northern and Central Europe and Asia.

Capet, the family name of a race of French kings, founded by Hugh Capet in 987 with its collateral branches. Reigned until 1848, except for the period of the French Revolution and Napoleon.

Capitol, a term that was first applied to the Temple of Jupiter on the Capitoline Hill, Rome, completed in 507 B.C. It was several times destroyed by fire and rebuilt. The existing Capitol, a large portion of which serves the purpose of a museum, was erected from designs by Michelangelo. In all the chief cities of the ancient Roman Empire there was a capitol or town-hall. In the United States the building occupied by Congress at Washington bears the name of the Capitol, and the halls of the legislative assemblies of the different States are so named.

Capricorn, a zodiacal constellation between Sagittarius and Aquarius, figured out in ancient times as having the head of the goat and the hind part shaped like a fish.

Capuchins are members of a mendicant order of Franciscans, founded in the 16th century with the aim of restoring the primitive and stricter observance of the rule of St. Francis, so called from the capuce or pointed cowl worn by them.

Carat, a term used in assessing the value of gold and precious stones. In connection with gold, it represents the proportion of pure gold contained in any gold alloy, and for this purpose the metal is divided into 24 parts. Thus 24-carat indicates pure gold, and any lesser number of carats shows the proportion of gold contained in the alloy. The carat as a measure of weight is now obsolete, having been replaced by the *metric carat* of 0·2 grams.

Caravan, a band of travellers or traders journeying together for safety across the Eastern deserts, sometimes numbering many hundreds. There are several allusions to caravans in the Old Testament. The great caravan routes of this period from Egypt to Babylon and from Palestine to Yemen linked up with the Syrian ports and so with western sea commerce. Many wars have been fought in the past over their control.

Carbohydrates, group of organic compounds composed of carbon, hydrogen and oxygen, *e.g.*, sugars, starches, cellulose. The carbohydrates play an essential rôle in all living processes. *See* **P39** (2).

Carbon, a non-metallic chemical element which occurs in crystalline form as diamonds and graphite; amorphous forms of carbon include charcoal and soot, while coke consists mainly of elementary carbon. The biochemistry of plants and animals largely hinges upon carbon compounds. The study of carbon compounds is called Organic Chemistry. *See* **F20.**

Carbonari, members of a secret political society originated in Naples, and at one time very numerous. Their chief aim was to free Italy from foreign rule, and they exerted considerable influence in the various revolutionary movements in the first half of the 19th century. Their name was adopted from the charcoal-burners (*carbonari*), and their passwords, signs, etc., were all in the phraseology of the fraternity.

Carbon dioxide. Commonest of the five oxides of carbon. It is formed when carbon and its compounds are burnt with abundant supply of air, and when carbon compounds are oxidised in the respiration process of animals. The atmosphere contains carbon dioxide to the extent of about three parts in 10,000; this figure remains more or less constant because, while carbon dioxide is always being added by animal respiration and the burning of fuels, such as coal and oil by man, plants are constantly removing it in the process known as photosynthesis or carbon assimilation. A heavy gas and obviously not one capable of supporting respiration, it can accumulate in caves, etc., and cause asphyxiation; for instance, in the Grotto del Cane, near Naples, a dog entering the cave is suffocated, whereas a man whose head is above the carbon dioxide level can walk through it unharmed. Solid carbon dioxide is called "dry ice." The gas in aerated drinks and soda water is carbon dioxide.

Carbon monoxide is a colourless gas with no taste or smell. It is formed when coal and coke are burnt with a restricted supply of air; the blue flame to be seen in a coke brazier, for instance, is the flame of carbon monoxide. This gas is very poisonous, forming with the hæmoglobin of the blood a compound which is useless for respiration and cherry red in colour, which gives a visible symptom of poisoning by carbon monoxide. With nickel it forms a volatile compound, called nickel carbonyl, and this reaction is the basis of the Mond process for extracting nickel.

Cardinal, a Roman Catholic ecclesiastical dignitary of the highest rank. Cardinals are divided into three classes, consisting of 6 cardinal bishops, 50 cardinal priests, and 14 cardinal deacons—70 in all. They are appointed by the Pope, and are associated with him in the government of the Church. A cardinal's dress consists of red cassock, a rochet, a short purple mantle, and a low-crowned red hat with cords and tassels.

Cardinal Virtues, according to Plato these were justice, prudence, temperance, fortitude—*natural* virtues as distinct from the *theological* virtues of the Roman Catholic Church, faith, hope, charity. The phrase "seven cardinal virtues," combining the two, figures in mediæval literature. (*See* **Sins, Seven Deadly.**)

Carlists, a Spanish political party espousing the claim of the descendants of Don Carlos, brother of Ferdinand VII., to the throne of Spain. On the death of the latter in 1833, Isabella, his three-year-old daughter, was proclaimed Queen, owing to the abolition of the Salic law. There

were several Carlist insurrections until the party was finally crushed in 1876.

Carlovingians, the second dynasty of the French kings (established 751), included such notable rulers as Charles Martel and Charlemagne. In 987 the Capet dynasty succeeded.

Carmelites, a body of mendicant friars taking their name from Mount Carmel, where the order was first established in the 12th century. The original rule of the order required absolute poverty abstinence from meat and a hermit life. The rigidity of the rule of the order was mitigated by Innocent IV. They wear a brown habit with white mantle, hence their name of White Friars. The order of Carmelite nuns was instituted in the 15th century.

Carnival, the great festival which takes place in Roman Catholic countries on the last three days before Lent, when people give themselves up to the wildest revelry, buffoonery, and masquerading. It is only in the chief cities of Italy, however, that the custom is kept up with anything of the old spirit. At Nice a modernised form of it is given, of which the "battle of flowers" is a feature.

Carnivora, a large group of animals forming an order of the Mammalia, including cats, dogs, wolves, foxes, civets, bears, otters, seals, sea-lions, walrus, and others. *See* **F25** (1).

Carp, a well-known fresh-water fish, found in plenty in most European and Asiatic still waters; reaches a length of about 2 ft. and under favourable conditions lives for about 40 years. Familiar British members of the family are the roach, rudd, dace, chub, gudgeon, tench, minnow, barbel, bream, and bleak. The goldfish, popular in ornamental ponds, is the domesticated variety of a Far Eastern member of the carp family.

Carpets are thick fabrics used for covering floors, and were first made in Eastern countries—Egypt, Persia India—finding their way to Europe in the Middle Ages. A carpet factory was established in France in the time of Henry IV., and one was set up at Mortlake, in England, in the reign of James I. The carpets of 16th-century Persia are celebrated for their artistic workmanship, examples having been preserved in the great museums of Europe. The best-known English carpets are the Axminster, Kidderminster, and Wilton.

Carthusians, an order of monks founded in 1084 by St. Bruno at the Grande Chartreuse near Grenoble, and introduced into England about a century later They built the Charterhouse (corruption of Chartreuse) in London in 1371. The chief characteristics of the order are a separate dwelling-house in the precincts of the charterhouse for each monk, and the general assembly in the Church twice in the day and once at night. They wear a white habit, with white scapular and hood. The liqueur *Chartreuse* was invented by the order and is still their secret. For many years they have derived large revenues from its sale. The order of Carthusian nuns was founded in the 12th century.

Casein, the chief protein in milk and cheese. It is coagulated by the action of rennet or acid. An important class of plastics ("casein plastics") are produced from it, and these plastics are converted into buttons, knitting-needles, etc. 8000 gallons of milk yield about a ton of casein.

Cassowary, a large bird of the ostrich family, inhabiting the Molucca Islands, New Guinea, and North Australia. It is of black plumage, with three toes, and has a horny crest upon its head. In fleetness it can outstrip the horse.

Castanets. Two small pieces of hard wood which are held in the hand and clicked together. The instrument is of Spanish origin and is commonly used to mark the rhythm of certain Spanish dance tunes.

Caste, a term used to specify the different hereditary social sections into which Indian Hindu society is divided. The four leading castes which are of ancient origin and go on from generation to generation, though they no longer fix the occupations of the people, are: (1) Brahmins or priests; (2) Kshatryas or soldiers; (3) Vaisyas or merchants; (4) Sudras or labourers and artisans. Pariahs are considered outcastes and are sometimes called "untouchable." Many other divisions and subdivisions of caste have been developed from these four and each has its own customs. Wealth has no relation to caste as such and a servant may be of high caste and his master of low caste. The caste system in modern India is being modified.

Castor-oil Plant (*Ricinus communis*), an African shrub now cultivated in most tropical countries. It has broad palmate leaves and bears a spiny fruit containing seeds which when pressed yield the well-known oil.

Cat, the general name for all quadrupeds of the *Digitigrade* section of the carnivorous order, from the lion down to the domestic cat. The latter is believed to be descended from the European Wild Cat and from Cats of other varieties. Egypt is credited with having been the first country in which the cat was domesticated. Among the finest varieties are the Short-haired Red Tabby, Persian, and Siamese. *See* **Z9–12**.

Catacombs are subterranean or built-up places of internment. The most famous are those of Rome, constructed by the early Christians, where in times of persecution they concealed themselves. They are of great extent, consisting of a labyrinth of vaulted galleries, 4–5 ft. wide, at different levels. These Roman catacombs are said to have contained over 6 million bodies and to have extended scores of miles in length, though not more than about six miles are now accessible. Catacombs have also been discovered in Naples, Cairo, Paris, etc. Attached to some modern cemeteries are catacombs of the built-up order, formed of chambers of stone or brick in the walls of churches or mausoleums.

Cataracts are gigantic waterfalls. The most famous are those of Niagara in North America, the Orinoco in South America, the Victoria Falls on the Zambesi in Africa, the Falls of the Rhine at Schaffhausen, and the Cascade of Gavarni in the Pyrenees.

Catechism, an elementary book of principles in any science or art, but more particularly in religion, in the form of questions and answers. There is a great variety of these, including the Lutheran, prepared by Luther in 1529. Calvin's Geneva (in 1536), and the Anglican, in the Book of Common Prayer.

Catechumens, a term applied in the primitive Church to children of Christian parents, who were admitted as neophytes, and occupied a place apart in the church.

Caterpillar, the larva of a butterfly or moth, worm-like in its segmented body, usually furnished with feet, often curiously marked and coloured, and frequently more or less hairy.

Cathedral, the chief church of a diocese, so called from its containing a Bishop's seat, or episcopal chair. The finest cathedral in the world is that of St. Peter's at Rome, founded in 1450. Other celebrated cathedrals are Notre Dame of Paris, the cathedrals of Cologne and Milan, St. Paul's in London, Canterbury Cathedral, York Minster, and the cathedrals of Durham, Bristol, Gloucester, Peterborough, Exeter, Liverpool, and Coventry (destroyed by bombs, now being rebuilt).

Cat's-eye, a kind of quartz, much valued as a gem, opalescent, and of various shades.

Cavalier, a name adopted during the troubles of the Civil War to designate the Royalist party; it is also used generally in reference to a knightly, gallant, or imperious personage.

Caves, natural hollow places in the earth, frequently found in limestone, less frequently in volcanic rocks. Popular caves in Britain are Kent's cavern near Torquay, Cheddar and Wookey hole in the Mendips; Fingal's Cave in Staffa (Inner Hebrides) is noted for its splendid range of basalt columns. The scientific study of caves is known as spelæology. The first discovery of Palæolithic paintings (the celebrated bulls) was made in the Altamira caves in Spain in 1879. (*See* **G5**.)

Caviare is a Russian preparation made from the salted roe of certain fish, such as sturgeon, sterlet, and sevruga, and much appreciated by epicures.

Cedar, a dark-leaved, cone-bearing, horizontal-branched evergreen tree that grows to a considerable height and girth, the best known

species in Britain being the Lebanon Cedar, which was introduced in the 17th century.

'Cello. (*See* **Violoncello.**)

Celluloid, one of the first synthetic thermoplastic materials, discovered by Alexander Parkes in 1865 when he was attempting to produce synthetic horn. It is made by treating cellulose nitrate with camphor and alcohol. The non-flam character of photographic film is conferred by the substitution of a cellulose acetate or other material as base for the dangerously inflammable celluloid otherwise used.

Cellulose, a carbohydrate, and a constituent of nearly all plants. Cellulose occurs in an almost pure state in the fibres of linen (flax), absorbent cotton, jute, and filter-paper (used in laboratories).

Celts, an ancient race of Western Europe, originally settled in Gallia, and afterwards spread over other parts of Europe, including Britain. The two chief divisions of Celtic Britons were the Gaels of Ireland and the North of Scotland, and the Cymri of Wales. The descendants of these races still retain many of their ancient characteristics, and considerable interest is manifested in their language and literature. A reference to Celtic art will be found on **G32**.

Cement means, in general technical parlance, an adhesive. Building cements are calcium silicate–aluminate mixtures made by heating lime with clay; the most widely used kind is Portland cement, invented in 1824 by Joseph Aspdin of Leeds.

Cenotaph (Greek = empty tomb), a monument erected in Whitehall, London, to commemorate all those who gave their lives in the service of the British Empire during the first world war. The permanent structure was unveiled by George V. on Armistice Day, 1920.

Censors were Roman magistrates vested with the power of keeping a record of all citizens, and of controlling the manners, morals, and duties of the peoples. In more recent times in England censors have been appointed by the government in connection with publications of the press or for the stage. During the first and second world wars there was a very strict censorship of news.

Census was the title given in ancient Rome to a register of citizens, with full particulars as to their family, children, slaves, and so forth. The term is now used to denote the periodical survey of the number and condition of the people. In Great Britain it takes place every ten years. The first official census in Britain was that of 1801; the last was taken in 1951.

Centre of Gravity of a body is the fixed point through which the resultant force due to the Earth's attraction upon it always passes, irrespective of the position of the body.

Ceorl, the name given to an Anglo-Saxon freeman in bond-service to a landed proprietor.

Cerium, a scarce metallic element discovered by Berzelius in 1803. It is capable of precipitation to powder, and only exists in combination in the minerals cerite, allanite, and a few others. A mixture of cerium and thorium nitrates is used in the manufacture of gas mantles, which owe their incandescent property to the deposit of cerium and thorium oxide with which they are coated.

Cestus, the name given to a girdle worn by Greek and Roman women around their waists, and generally decorated. It was also the name of the loaded gauntlet worn by boxers in the Roman arena.

Cetacea, the order of mammals including the whales, dolphins, and porpoises, which, though strictly aquatic, breathe air, suckle their young, and are warm-blooded.

Chain reaction. *See* **F11 (1)**.

Chalcedony, a fine quartz with a waxy lustre, and much used by jewellers for necklaces, bracelets, etc. Commonly it is white or creamy. Its bright orange-red variety is called carnelian; its brown variety, sard. Chrysoprase, plasma, bloodstone are varieties which are respectively pale apple-green, dark leek-green, green with red spots.

Chalk, a white limestone, calcium carbonate, found in the Upper Cretaceous deposits (formed from the shells of minute marine organisms). In southern England the chalk is a soft rock, but in Yorkshire, Scotland, and Ireland it is solid limestone. French chalk is hydrated magnesium silicate, a variety of talc.

Chama, a genus of large bivalves of the mollusc family, found in tropical waters, especially amongst coral reefs. *Chama gigas* weigh sometimes as much as 300 lb., and one valve has been employed as the basin of baptismal fonts in various churches.

Chamberlain, Lord, the senior officer of The Royal Household who is responsible for all ceremonial within the palace (levées, courts, garden parties, entertainment of foreign royalties and heads of state) but not the coronation or state opening of parliament. He is also in charge of appointments to The Royal Household and is examiner and licenser of plays.

Chamberlain, Lord Great, one of the great officers of state whose duties are now mainly ceremonial. He attends the monarch at the state opening of parliament and at the coronation and is custodian of the Palace of Westminster (Houses of Parliament). The office is hereditary, dating from Norman times, and is held for one reign in turn by the descendants of the De Veres, Earls of Oxford.

Chamber Music, strictly, signifies music suitable for playing in a small room, but is used to cover music specially composed for small combinations of instruments; *e.g.*, string quartets, etc.

Chameleon, a family of lizards of which there are numerous species. The common chameleon is a native of Africa, and is about 12 inches long, including tail. It is remarkable for its power of changing colour to resemble its surroundings when surprised, a power that is due to the presence of pigment-bearing cells beneath the skin. It is slow in movement, and insectivorous.

Chamois, a species of antelope, and a native of Western Europe and Asia. It is not much larger than a goat, lives in mountainous regions, and possesses wonderful leaping power, so that it is very difficult to capture. Its flesh is much esteemed, and from its skin chamois leather is made. The mating season is Oct.–Nov., and the fawns are born in May or June. They can follow their dam when only a day old. Live to be 20–25 years old.

Channel Tunnel, a scheme to bore a tunnel through 20–30 miles of chalk under the sea between Dover and Calais was proposed in the second half of the 19th century. The bill authorising the work was rejected in 1883. In 1930 the scheme was again proposed by many enthusiastic supporters. The tunnel would be the longest ever made and an engineering wonder of the world. It would consist of two tubes with frequent connections. Electric trains would run through, taking only ¾ hour and reducing the journey between London and Paris by about 2 hours. The estimated cost, however, being more than 35 million pounds, the attendant military risks, and doubt as to feasibility of construction led the Government in June 1930 to reject the proposal. Tunnelling was actually begun some years ago on the British side and the project never fails to be a fascinating subject for discussion.

Chantry, a private church or chapel established and endowed for the maintenance of priests to perform daily Mass for the souls of certain specified persons. Chantries were numerous in England up to the Reformation, and some few still remain.

Chapel Royal, the church dedicated to the use of the Sovereign and Court, and at present situated in St. James's Palace.

Charcoal, a term applied to wood that has been subjected to a process of slow smothered combustion. More generally it refers to the carbonaceous remains of vegetable, animal, or combustible mineral substances submitted to a similar process. Charcoal from special woods (in particular buckthorn) is used in making gunpowder. Bone charcoal finds use in sugar refining, as it removes dark colouring matter present in the crude syrup.

Charterhouse, a famous school that was in Aldersgate Street, London, but removed to Godalming. In connection with the school is an almshouse on the old London site, endowed by Thomas Sutton in 1611. Thackeray, as well as Addi-

son, Grote, and other eminent men, were Charterhouse scholars.

Chartism, the principles or practices of a body of political reformers who (1837–48) conducted a movement for amelioration of social and industrial conditions of the working classes. Their platform was stated in the National or People's Charter, drafted by Francis Place in the form of a charter or act of Parliament, and published May 8, 1838. Reform was demanded under six heads: universal adult male suffrage, vote by ballot, annual parliaments, payment of members, equal electoral districts, and abolition of the property qualification.

Chasuble, a sleeveless vestment worn by ecclesiastics over the alb during the celebration of Mass. It is supposed to symbolise the seamless coat of Christ. Its use in English churches was prohibited in 1552, but again permitted after 1559. It gradually fell into disregard, however, but some fifty years ago was resumed in the High Church services.

Chauvinism is a term applied to any exaggerated devotion to a cause, more particularly to excess of public or military enthusiasm. The word springs from Nicholas Chauvin, whose extravagant devotion to Napoleon I. made him a laughing-stock.

Cheese, an article of food made from the curd of milk, which is separated from the whey and pressed in moulds and gradually dried. There are about 500 varieties differing with method of preparation and quality of milk. They used to be made in the regions after which they are named but nowadays many of them are mass-produced, *e.g.*, Cheddar is made not only in all parts of Britain but in Canada, New Zealand, Australia, Holland, and the U.S.A. Cheeses may be divided into 3 main classes: (1) soft, *e.g.*, Camembert, Cambridge, Port l'Evêque; (2) blue-veined, *e.g.*, Stilton, Gorgonzola, Wensleydale, Roquefort; (3) hard-pressed, *e.g.*, Cheddar, Cheshire, Gruyère, Parmesan, Gouda.

Cheetah, the large spotted cat of Africa and Southern Asia, often called the "hunting leopard" because of its employment in the chase.

Chemistry is the science which analyses and describes the properties and composition of various natural substances. It had its rise in alchemy and has gradually developed into a science of vast magnitude and importance. Organic chemistry deals with the chemistry of the compounds of carbon; inorganic chemistry is concerned with the chemistry of the elements; physical chemistry is concerned with the study of chemical reactions and with the theories and laws of chemistry.

Cherokees, a North American tribe of Indians, once a powerful and warlike nation occupying a large portion of the Allegheny range, but now residing within the Indian Territory under civilised rule of law and very prosperous.

Chestnut, the fruit of the chestnut tree; those of the Spanish chestnut, *Castanea vesca*, furnish a favourite esculent. The wood is used in carpentry; while the horse-chestnut (*Æsculus hippocastanum*) is much employed in brush-mounting and in cabinet work.

Chiaroscuro, a term used in painting to denote the arrangement of light and shade in a picture. On the proper handling of chiaroscuro depends the fidelity of depiction of objects and distances.

Chief of Imperial General Staff, the present title of the Supreme Commander of the British Army. General Sir Francis Festing succeeded Field-Marshal Sir Gerald Templer as C.I.G.S. in Sept. 1958.

Chiltern Hundreds, three hundreds—Stoke, Burnham, and Desborough—the stewardship of which is now a nominal office under the Chancellor of the Exchequer. Since about 1751 the nomination to it has been used as a method of enabling a member of Parliament to resign his seat on the plea that he holds an office of honour and profit under the crown. (This has been a disqualification for Parliament since 1707.)

Chimpanzee, a large anthropoid ape, a native of tropical West Africa, of a dark brown colour, with arms reaching to the knee, large ears, and a general organisation resembling that of man. It possesses considerable intelligence, can walk erect with ease, and when full grown is about 4 ft. high.

Chinchilla, a South American rodent. Grey in colour, and black and white underneath. It is greatly esteemed for its beautiful fur.

Chippendale Furniture was introduced in the reign of George I. by Thomas Chippendale, a Worcestershire cabinet-maker who migrated to London and set up for himself in St. Martin's Lane, Charing Cross. He was fonder of inventing designs for furniture than of making it, and in 1752 published a book of patterns; the London furniture-makers of the day soon began to model their work upon it.

Chlorine, a gaseous element of the halogen family, first isolated in 1774 by Scheele by the action of manganese dioxide on hydrochloric acid. It unites easily with many other elements, the compounds resulting being termed chlorides. The gaseous element is greenish-yellow, with a pungent odour. It is a suffocating gas, injuring the lungs at a concentration as low as 1 part in 50,000 and was used during the first world war as a poison gas. Has a powerful bleaching action, usually being used in form of bleaching powder, made by combining lime and chlorine. Also a valuable disinfectant; used, for instance, in rendering water of swimming baths sterile.

Chloroform, a volatile colourless liquid, is prepared for commercial purposes by distilling a mixture of chloride of lime, alcohol (or acetone), and water; but for medical use it is made from chloral hydrate, which yields a purer distillate. When the vapour is inhaled it produces unconsciousness and insensibility to pain. It owes its discovery to Liebig, and its first application for medical purposes to Sir James Young Simpson (**P5** (**2**)).

Chlorophyll, the green pigment contained in the leaves of plants, first discovered by P. J. Pelletier (1788–1829) and J. B. Caventou (1795–1877) in 1818. Enables the plant to absorb sunlight and so to build up sugar. *See also* **Photosynthesis, F30** (2).

Chorale. Originally a Lutheran hymn-tune, but used, especially by J. S. Bach, as a basis for instrumental or choral pieces, *e.g.*, Chorales and Choral Preludes.

Chord. A number of notes played simultaneously.

Chouans, the name given to the band of peasants, mainly smugglers and dealers in contraband salt, who rose in revolt in the west of France in 1793 and joined the royalists of La Vendée. Balzac gives a picture of the people and the country in which they operated in his novel *Les Chouans*. They used the hoot of an owl as a signal—hence the name.

Chough, a member of the crow family, of glossy blue-green-black plumage, whose long curved bill and legs are coral red. It used to be abundant on the cliffs of Cornwall, but its haunts are now restricted to the rocky outcrops of the western coasts and in the mountains near by. It nests in cleft rocks and caves. The Alpine chough with yellow bill inhabits the mountainous districts of Europe and Asia and is not found in Britain.

Chrism, the ointment (oil mixed with balsam) consecrated on Maundy Thursday in the Roman and Greek orthodox churches by the bishop and used at baptism, confirmation, ordination, etc.

Christianity, the religion proclaimed by Jesus Christ. Its principles are set forth in the New Testament, and its churches abound all over the world. Although Christianity has had a great influence on Western civilisation, the West is finding it increasingly difficult to live up to her own Christian principles.

Christmas means "mass of Christ" from the old English *Cristes maesse*, which is celebrated by the Western church on December 25. The actual day on which Christ was born is not known and there is some uncertainty about the year. December 25 as the day of Nativity was not generally observed until the 5th century, A.D., though, as the winter solstice, it had long been observed as a pagan festival of *sol invictus* (unconquered sun). The first Christmas card dates from about 1843 and the Christmas tree, of pagan origin, was introduced into England from Germany by Queen Adelaide, wife of William IV. Santa Clause is a corruption of Saint Nicolas, patron saint of children, whose feast day properly falls on December 6.

Chromatic Scale, a scale proceeding in intervals of

one semitone. *E.g.*, chromatic scale in C C–D♭–D–E♭–E–F–G♭–G–A♭–A–B♭–B–C.

Chromium, a very hard, bluish-white metal, melting at a very high temperature (above 1900° C.). Its chief ore is chromite or chrome iron-ore (ferrous chromite). "Ferro-chrome" is produced by heating chromite and anthracite in an electric furnace, and chrome steels are prepared by adding the pre-calculated amount of ferro-chrome to melted steel. Best known chrome steel is stainless steel first made by Brearley in 1912 and since then developed greatly at Sheffield. A typical formula is 18 per cent. chromium, 8 per cent. nickel, 74 per cent. iron. Equally important are Stellite alloys, containing chromium, cobalt, tungsten (or molybdenum), which have made possible modern high-speed cutting tools. Dies used in manufacture of plastics are commonly of chrome steel. The elementary metal finds little use alone except in chromium-plating for motor cars, etc.

Chromosomes, the bodies contained within the nucleus of every animal or plant cell, each containing several hundreds of the hereditary factors called *genes*. When the cell divides, each chromosome splits, so that every cell contains an identical complement of genes. Human cells have 23 pairs of chromosomes. *See* **F31, 58**.

Church Commissioners The Church Commissioners were established in 1948 by the amalgamation of Queen Anne's Bounty (established 1704) and the Ecclesiastical Commissioners (established 1836) to administer Church revenues and to manage Church property generally. The Commissioners own in investments and real estate a total of over £200 million.

Cid, The, a famous Spanish hero of the 11th century, Don Rodrigo Diaz de Vivar, who, before he was twenty, led a Spanish force against the Moors, and drove them out of Spain. He is celebrated in poem, play, and romance. *See* **G38** (**2**).

Cider, a fermented liquor made from the juice of apples by crushing the fruit to pulp when ripe. The cider of Devonshire, Somersetshire, Worcestershire, and Herefordshire is the best.

Cinchona, the tree native to the Andes which is famous for its bark, source of the drug quinine. It was introduced into Ceylon, India, and Java, the latter becoming the main supplier of quinine.

Cinque Ports, a number of seaport towns on the coast of Kent and Sussex, originally five: Hastings, Romney, Hythe, Dover, and Sandwich. Winchelsea and Rye were added later. These ports were required to furnish a certain number of ships, ready for service, and in return they were granted many privileges. The official residence of the Lord Warden is Walmer Castle. Sir Winston Churchill is the present Lord Warden and Admiral of the Cinque Ports.

Cistercians, an order of monks and nuns taking their names from Cîteaux, near Dijon, where their first monastery was established in 1098. The order was noted for the severity of its rule. They were famous agriculturists. The habit is white, with a black cowl or hood. The order declined, and in the 17th century there was a reform movement instituted by the Trappists, who were later organised into a separate order.

Citron, the fruit of a tree of the lemon order (*Citrus medica*) with thick rind, much used for candied peel.

Civet, a carnivorous quadruped from which civet perfume is obtained.

Civil List is the annual sum payable to the Sovereign to maintain the Royal Household and to uphold the dignity of the Crown. The amount is granted by Parliament upon the recommendation of a Select Committee and has to be settled afresh in the first six months of a new reign. The Civil List of Queen Victoria was £385,000; Edward VII. and George V., £470,000; Edward VIII. and George VI., £410,000; Elizabeth II., £475,000. The annuities payable to members of the Royal Family do not form part of the Civil List but are a charge on the Consolidated Fund; Queen Mother, £70,000; Duke of Edinburgh, £40,000; Duke of Gloucester, £35,000; Princess Royal, £6,000; Princess Margaret and Princess Anne, £6,000 (£15,000 on marriage). Prince Charles has his own income from the Duchy of Cornwall.

Clarinet, a wood-wind instrument with a single reed which gives forth a rich, smooth tone. The reed is "tongued" and the note selected by operating keys which open or close holes in the wooden tube. A larger instrument of lower pitch is known as the bass clarinet.

Cleopatra's Needle on the Thames Embankment is of the time of Tuthmosis III. (1500–1450 B.C.). Presented to the British Government by Mehemet Ali in 1819, but not brought to this country until 1878. Its weight is 180 tons and it is 68½ ft. in height. *See also* **G16** (**1**).

Climate is a generalised representation of the day-to-day weather conditions throughout the year, the combination of all weathers thus determining the climate of a place. Averages and extremes of temperature, variation of humidity, duration of sunshine and cloud cover, amount of rainfall and frequency of snow, frost, gales, etc., are amongst the data normally investigated. The interiors of great land masses are characterised by large ranges of temperature and low rainfall (continental climate), while proximity to oceans has an ameliorating effect with increase in rainfall (oceanic climate). Presence of mountain ranges and lakes and configuration generally produce local modifications of climate, also apparent between the centre and the outlying suburbs of a city. There is evidence that vast changes of climate have occurred during geological time. Since the mid-19th century most of the world has shown a tendency to be warmer; the rise in annual mean temperature is now over 1° C. But this trend now seems to be easing off. Latitude introduces zones of climate, *e.g.*, tropical rain, subtropical steppe and desert, temperate rain and polar.

Cloaca Maxima, the name of the great underground sewer of Rome, constructed in the reign of Tarquinius Priscus (*circa* 588 B.C.) and still extant in its chief structural features.

Clock, a device for measuring the passage of time. The earliest timekeeper was the shadow-clock, a primitive form of sundial, used in Ancient Egypt about 1500 B.C. To find the time at night the water-clock or clepsydra was used. The sand-glass dates from the 15th century. No one knows when the first mechanical clocks were invented, but it is known that a complicated mechanical clock driven by water and controlled by a weighbridge escapement was built in Peking in 1090. The Dover Clock in the Science Museum is not the earliest surviving clock in England, as was once believed, but early 17th century. The Salisbury Cathedral clock dates from 1386 and that of Wells Cathedral from 1392. The pendulum clock was invented by the Dutch scientist Christiaan Huygens (1625–95). The first watches were made in Nuremberg shortly after 1500. The marine chronometer is a high-precision timepiece used at sea for giving Greenwich mean time. The quartz-crystal clocks at Greenwich are accurate to one thousandth of a second a day, and the improved atomic clock, recently developed at the British National Physical Laboratory, which makes use of the natural vibrations of the cæsium atom, is said to be an almost absolute measure of time (accurate to 1 sec. in 300 years). A comparison of the time-keeping of the cæsium clock with the quartz-crystal clock reveals that the earth in its rotation about its axis is slowing down by a thousandth of a second in 2 years. What this irregularity is due to is not yet known.

Cloisonné, a kind of fine pottery with enamelled surface, decorated with elaborate designs, the outlines of which are formed by small bands or fillets of metal. The Byzantines excelled in this work, but in the 20th century Japan and China led in Cloisonné-ware.

Cloisters are covered walks or vaulted arcades attached to monastic and ecclesiastical buildings, usually surrounding a quadrangle and serving for exercise and relaxation.

Cloud chamber, an apparatus invented by C. T. R. Wilson in which the tracks of sub-atomic particles can be made visible. Just as the vapour trails tell of the track of an invisible aircraft high up in the air, so the vapour trails

of an unseeable particle can tell of its behaviour. The rays under investigation pass through a chamber containing air, thoroughly cleansed of dust, supersaturated with water vapour. As the particle passes through it forms a track of tiny water droplets which can be photographed. *See also* **F66** (2).

Clouds are formed by the ascent of moist air, the type depending on the way the air ascends and the height at which condensation occurs. There are three main classes: (1) high cloud (above 20,000 ft.)—cirrus (delicate and fibrous), cirrostratus (thin white veil), and cirrocumulus (delicately rippled) consisting of ice crystals; (2) medium cloud (above 7,000 ft.)—altostratus (dense, greyish veil) and altocumulus (broken flattened cloudlets)—chiefly water particles, often supercooled; (3) low cloud (from near ground to 7,000 ft.)—cumulus (fair weather, broken, dome-topped), cumulonimbus (heavy, towering to great heights), stratocumulus (layer of globular masses or rolls), stratus (like fog but off the ground), nimbostratus (low, rainy cloud).

Clover, plants of the *Trifolium* genus, of which there are about 300 species. The best known kinds are *White Clover*, a common pasturage product in nearly all parts of the world; and *Red Clover*, the most widely cultivated of all, much esteemed as fodder for cattle. The nectar of white clover is an important source of honey; the tongue of the hive bee is too short to tap nectar from the red clover, which is pollinated instead by bumble bees. *The Subterranean Clover* has two kinds of inflorescence; one is normal but the other buries itself underground, where the fruits ripen, a habit reminiscent of the ground- or monkey-nut.

Cloves are the dried flower-buds of a species of myrtle (*Eugenia caryophyllata*) grown principally in Zanzibar and Madagascar.

Club Mosses *or* **Lycopods**, also called "ground pines." These relatively primitive land plants (in the evolutionary scale they are placed below the ferns) are usually found in dry open spaces in temperate countries. These plants have long creeping stems covered with numerous small pointed leaves. Five species occur in Britain. Huge lycopods existed in the Carboniferous period, and their bodies have decomposed to produce a large fraction of our coal seams.

Coal is a carbonaceous mineral substance, commonly black and easily breakable, and may be either dull or shiny. It is very inflammable, and has formed for a long period the most important substance for fuel in employment in most civilised lands. It is composed of chemically altered vegetable matter, chiefly the timber of long extinct lycopodiaceous trees (*se* **Club Mosses**) and is found as a sort of stratified rock in the coal measures. Anthracite coal has lost nearly all its hydrocarbon by change or by pressure, and this and the more highly bituminous coals are greatly employed in manufacturing industries the world over, while those less so are used for household purposes. A ton of coal will yield by high temperature carbonisation from 10,000 to 15,000 cu. ft. of gas, 8 to 12 galls. of tar, 13½ cwts. of coke and about 20 galls. of ammoniacal liquor, varying according to the class of coal used. It is calculated that in seams of one foot thickness or more to a depth of 4,000 ft., the proved resources of coal in Great Britain amount to 120,000,000,000 tons and the probable total resources to 170,000,000,000 tons. Production in Great Britain is over 200 million tons a year and most of it is for home use. In 1947 the British coal industry was transferred to the National Coal Board.

Coal Tar. (*See* **Aniline.**)

Coat of Arms, in heraldry, is a device containing a family's armorial bearings. In mediæval times it was an actual coat upon which such device was embroidered, and knights wore it over their armour.

Cobalt, a white metal melting at 1490° C. Two main ores are *cobalt glance* (in which the element is combined with arsenic and sulphur) and *smaltite* (cobalt arsenide). The principal sources are Ontario and the Belgian Congo. Various cobalt alloys are important, *e.g.*, Stellite, Ferro-cobalt, and Carboloy. Its monoxide is an important colouring medium, and is used for colouring glass and porcelain.

Cobra, hooded and very venomous snakes. The best known species are the Indian Cobra, the Egyptian Cobra, and the Black-necked Cobra. Their food consists chiefly of small rodents. The King Cobra is almost exclusively a snake-eater. "Spitting" Cobras (or Ringhals) of S. Africa are a related genus, capable of spitting their venom several yards.

Coca, a South American shrub, *Erythroxylon coca*, which yields three crops a year of leaves and flowers. The leaves are chewed by the natives and act as a strong stimulant, enabling them to withstand hunger and fatigue to an astonishing degree. It is used in medicine as a tonic, and yields the alkaloid cocaine. Over 50,000,000 pounds of coca leaves are gathered yearly.

Cochineal *or* **Carmine**, a dyestuff consisting of the dried bodies of the female scale insect (*Coccus cacti*). The dye is of ancient origin, was well known to the Aztecs, and was used widely in the Middle Ages. The famous scarlet tunics worn by the English during the Napoleonic wars owed their colour to carmine. The German microscopist Ehrenberg is credited with being the first to apply carmine as a biological stain in 1838.

Cock-a-Bendy, a contrivance for twisting ropes, consisting of a hollow piece of wood through which a pin runs. By reason of the rotation of this pin when the cock-a-bendy is held in the hand, twist is imparted to the rope.

Cockatoo, a member of the parrot family, bearing a crest of feathers on the head, native to Australia and adjacent regions. Predominant colour is white tinged with yellow or scarlet while some species have dark plumage. The great black cockatoo of New Guinea is slaty black with pale red cheeks and can crack Kanary nuts which usually require a hammer to break them open.

Cockatrice, a basilisk or fabulous serpent supposed by an exploded tradition to have been hatched from a supposititious egg of a cockatrice by a serpent. Its glance or breath was, according to legend, fatal.

Cockchafer (*Melolontha*), one of the most destructive of beetles, the larvæ feeding on roots. It is about 1 inch in length, of a brownish colour, and emits a loud whirring sound when flying.

Cockle, the popular name of the shell-fish of the genus *Cardium*, found plentifully in sandy bays near low-water line; there are numerous British species.

Cockroach, popularly called the black-beetle, though it is neither black nor beetle. A great pest of bakeries, kitchens, etc. In Britain there are two species commonly found: the *Common* or *Oriental Cockroach* (*Blatta orientalis*) and the *German Cockroach* (*Blattella germanica*). The former is twice as large as the latter, and dark brown as against light brown or dark yellow; it used to be our commonest species, but is now outnumbered by the German Cockroach. Both are natives of Africa; Common Cockroach reached England about Queen Elizabeth's time; German Cockroach was a later arrival.

Cocoa. (*See* **Cacao.**)

Coconut Palm (*Cocos nucifera*), a tropical tree which grows to a height of from 50 to 100 ft., and has its tops surmounted by feather-like curving leaves. The fruit of this tree is the ordinary coconut, which is one of the most important sources of food and raw material for people living in tropical regions. The shell and fibrous husk are used for a variety of purposes, such as drinking-cups, spoons, brushes, matting, and cordage. Copra, the dried kernel of the coconut, yields oil used in the manufacture of soap, margarine, cosmetics, and chocolate. The cake provides animal feeding-stuffs. Main producing areas: Indonesia, Philippines, Malaya, Ceylon, and Southern India.

Cod are well-known food-fish, found in abundance upon the British coasts and upon the banks lying off Newfoundland, their capture and preparation for market, and the extraction of the oil they yield, forming important industries.

Codes, a term used to designate a system of laws properly classified. The Code of Hammurabi, king of Babylon, *c.* 1700 B.C., had extensive influence over a long period. The Romans formulated several codes of historic importance including the Theodosian Code which summarised the Roman laws from the time of

Constantine to 438 A.D. The final codification was made under order of the Emperor Justinian by his chief minister Tribonian and published in 529 with a new edition in 534. The most important of modern codes is the *Code Napoléon*, compiled between 1803 and 1810, and still in force. It has been used as an example for the codification of the laws of a number of countries from America to Japan. Under Frederick the Great the law of Prussia was codified. English law has never been codified, although the law on certain subjects has been gathered up into a single statute, which practically amounts to its codification.

Codex, a manuscript volume of the Scriptures, comprising the Sinaitic codex of the 4th century, the Vatican codex of the same period, the Alexandrine codex of the 5th century, and others. The British Museum, in 1933, purchased the *Codex Sinaiticus* from the Soviet Government for £100,000.

Cœlacanth (= "hollow spine," pronounced seelakanth), is the name of one of the oldest fishes, a sub-order of the Order Crossopterygii, with large armoured head, which lived some 300 million years ago (Middle Devonian). It was first freshwater in habit, but later became marine. Fossil records ceased 60 million years ago (Cretaceous), and it was believed to have become extinct. In 1938, however, a living cœlacanth fish (*Latimeria chalumnæ*) was caught off the coast of S. Africa, and another off Madagascar in December 1952 which stimulated world-wide interest. A life-size coloured model of the fish is in the British Museum (Natural History).

Coffee, a shrub found originally in Arabia and Abyssinia, but now extensively grown in the West Indies, Brazil, India, and Central America. It yields a seed or berry which, after undergoing the necessary preparation, is ground and largely used in most countries as a popular breakfast beverage. The best coffee is the Mocha, an Arabian variety. The stimulating effect of coffee is due to the caffeine, which is also present in tea. The beverage was introduced into Europe in the 16th century, and the first London coffee shop was opened in 1632.

Coke is the solid residue remaining when coal is carbonised and nearly all the volatile constituents have been driven off. Used as fuel, and as an agent for reducing metallic oxides to metals.

Cold War. Hostility fanned between two countries nominally at peace by propaganda of various kinds.

Colonies. The Phœnicians, Greeks, and Romans, were all colonists. Colonisation in its more modern significance was the result of important geographical discoveries made in the Western World in the 14th century, and later by the Spaniards, Portuguese, Dutch, and French. From about the beginning of the 17th century Britain developed a colonising spirit, and her Colonial Empire grew as her sea power grew. The 13 American colonies were lost to England during the American War of Independence (1775–83). The oldest colony is Bermuda, settled by the Virginia Company in 1612; the youngest is Sarawak (1946), which had been a protectorate since 1888. The largest colony was Nigeria (due for independence Oct. 1960), and the smallest is Gibraltar, which was captured from the Spanish in 1704. The longest river in the Colonies is the Niger, and the highest mountain is Kilimanjaro in Tanganyika. Ceylon was the first British colony with indigenous civilisation to achieve Dominion status (1949). The "colonies" of the British Commonwealth are not colonies in the strict sense (*see* **Outline of the British Commonwealth, C12–15, K189–90**).

Colorado Beetle, a leaf-eating beetle which is a serious pest of potato crops. The adults somewhat resemble a lady-bird, with alternate stripes of black and yellow. The grub is a reddish insect with two rows of small black spots on each side. The orange eggs are laid on potato leaves. The beetle is avoided by birds because it has a nasty taste.

Colosseum, the name of the Flavian amphitheatre at Rome, begun by Vespasian and finished by Titus A.D. 80. In general outline it still remains one of the most magnificent ruins in the world. In the arena of this great building the famous gladiatorial displays and mimic naval battles used to be given, and about 50,000 spectators could be accommodated. *See also* **G26** (1).

Colossus is the name which the ancients gave to any statue of gigantic size. The Colossus at Rhodes, which was a bronze statue of the sun god, Helios, was the most famous, and reckoned among the seven wonders of the world. It stood over 100 ft. high at the mouth of the harbour and legend says that ships could pass between its legs. It fell in an earthquake in 224 B.C.

Columbia University, New York, was founded as King's College by a charter from George II. The University celebrated the two hundredth anniversary of its founding in 1954.

Column, in architecture, is an upright solid body serving as a support or decoration to a building. Columns consist of a pedestal, a shaft, and a capital, over which the supported entablature rises. They are named according to the styles of architecture of which they form part, being Doric, Tuscan, Ionic, Corinthian, or Composite as the case may be.

Comets are celestial bodies which move about the solar system in elliptical or parabolic orbits. Usually these star-like bodies are accompanied by a long shining tail. The parabolic comets are seen once only, and do not reappear; the elliptical comets are periodic, and their recurrence can be calculated with accuracy. Comets are of enormous magnitude, sometimes covering millions of leagues, but their light is feeble in comparison with that of a star. Chief among the periodic comets is Edmund Halley's, the first to return as predicted in 1757. It reappears about every 76 years and is next due in 1985. The most spectacular comet of the 19th century was that found by Donati in 1858.

Comitia were gatherings of the Roman people for the purpose of voting on public affairs. They were of three kinds; the *comitia curiata*, composed of representatives of the patrician families; the *comitia centuriata*, which voted on laws, capital crimes, and imperial affairs; and the *comitia tributa*, a plebeian assembly which elected the lower magistrates of the people and which was the usual organ for laws passed by the whole people.

Common Law, in England, is the unwritten law established by custom, usage, and precedent, and not by statute. Both statute law and equity overrule common law when courts are called upon to decide between them. *See* **D4**.

Commons are unenclosed tracts of land sometimes dedicated to the use in common of the inhabitants of the township in which they lie. Many of these common lands were enclosed during the agrarian revolution in the Tudor period. The four chief rights of common are: (1) estovers—the right of taking wood for house building or firewood; (2) pasture, or right of grazing beasts; (3) turbary, or right of digging turf; (4) piscary, or the right to fish.

Commons, House of, the Lower House of the British Parliament. Is the symbol of democracy and is the Mother of Parliaments. Its 630 (1959) members are elected by the suffrage of men and women voting in constituencies. It is elected for a maximum duration of 5 years. *See* **C7**.

Commune, smallest French administrative division, generally presided over by a mayor and municipal council.

Commune of Paris has twice played a dramatic part in the national history. In 1792 it was able, through its control of the administrative organisation of Paris, to override the National Assembly. In 1871, after the withdrawal of the Prussian troops, it tried to assert its authority. Public buildings were destroyed by members of the Commune and civil war raged during April and half May, but Government troops suppressed the rising.

Communism is an advanced form of socialism, having as its aim an internationally planned society where the exploitation of any section of the community no longer exists. Under communism the State belongs to the people, whose energies are directed towards shaping it for the common good. Ownership of property, apart from personal needs, is not allowed and the aim

is to establish a classless society. As a theory of social equality, communism may be said to have begun with the Jewish Essenes and certain early Christian communities. As a political movement it dates from *The Communist Manifesto* of Marx.

Compass *or* **Mariner's Compass** is an instrument by which the magnetic meridian is indicated, and comprises a horizontal bowl containing alcohol and water, a card upon which the thirty-two points of the compass are marked, and the steel needle which always points to the meridian. Although the discovery of the directive property of a magnet is credited to the Chinese, the first practical use of this property in a compass was made in western Europe in the 12th century. Aircraft and ships now largely employ gyrostatic compasses which are not affected by electrical and magnetic disturbances. Sperry, Brown, and Anschutz are three important types of gyroscopic compass.

Concerto, a kind of hybrid between the Symphony and the Sonata. It may be regarded as a Symphony in which one instrument has a preponderance of solo passages or as a Sonata in which the solo instrument is accompanied by full orchestra.

Conclave, an assembly of Roman Catholic Cardinals met together to elect a Pope. The last Conclave was held in the Vatican, Oct. 26–28, 1958, when Cardinal Roncalli, Patriarch of Venice, was elected Pope John XXIII.

Concordat, an agreement or convention between the Pope and a secular government regarding ecclesiastical matters. The Concordat of Worms in 1122 between Calixtus II. and the Emperor Henry V. was famous as deciding a long struggle in regard to investiture. In 1801, Napoleon concluded a concordat with Pius VII. defining the restored relations between the head of the Church and the French Roman Catholics.

Condor, a large vulture of brilliant black plumage and having a circlet of white feathers round its neck. It is a native of the Andes.

Condottieri were mercenary soldiers engaged in the wars of the Italian States in the Middle Ages.

Confederation is a free association of sovereign states united for some common purpose. It is to be distinguished from a Federation, which is a union of states with one central government, each state relinquishing its sovereignty, though retaining some independence in internal affairs.

Congregationalists *or* **Independents,** the oldest sect of Nonconformists who hold that each Church should be independent of external ecclesiastical authority. They sprang from the Brownists, who arose in Elizabeth's days, but were compelled to take refuge in Holland. Under Cromwell they were able to extend their ministration and became a powerful body. Charles II.'s Act of Uniformity drove them forth again, but they regained full liberty of worship under William III.

Coniferæ are cone-bearing trees, including firs, pines, cedars, cypresses, junipers, yews, etc., and are widely distributed.

Conscience Money is money paid to the Chancellor of the Exchequer by persons who have previously omitted payments and are prompted to do so by their conscience.

Conservatism unites three component elements: a distrust of the unknown and an inclination we all share towards the familiar; a respect for authority; and a feeling for the greatness of the country which has been called imperialism. Conservatives thus stress the importance of adopting existing institutions, including property, and are opposed to Socialism and radical change. The name "Conservative" came into general use after 1834 in place of the older name of "Tory," although "Tory democracy" is now widely used to describe Conservative social reform policy. Conservative doctrine is based upon the teachings of Burke and Disraeli, and the Party has always been associated with agricultural interest and has also been supported, since the latter part of the 19th century, by commercial and financial interests. Defeated in 1945, the Party adopted two years later its "Industrial Charter" envisaging a system of free enterprise which is on terms with authority and which reconciles the need for central direction with the encouragement of individual effort. The Conservatives have held office since 1951, having increased their parliamentary strength in three successive general elections, gaining 321 seats in 1951, 345 seats in 1955, and 365 seats in 1959, at which election they polled 13,750,935 votes (49·4 per cent. of electorate). The Conservative manifesto *The Next Five Years* envisaged the doubling of the British standard of living in this generation.

Consistory, a term applied to the private council or state under the Roman Empire, but in later times used to designate the higher ecclesiastical courts and senates of the Anglican and Roman Churches.

Constable, an office of high rank in mediæval times, and still, in some few offices, representing considerable dignity. The office of Lord High Constable of England existed until 1521, since when it has been revived temporarily for special occasions such as Coronations. Before the introduction of the police system in England, every hundred and parish had its constables upon whom devolved the duty of keeping the peace. The official designation of a policeman is police constable.

Constitution, the fundamental organic law or principles of government of a nation, state, society, or other organised body, embodied in written documents, or implied in the institutions and customs of the country or society; also a written instrument embodying such organic law, and laying down fundamental rules and principles for the conduct of affairs. The British constitution is "customary" or "unwritten," and may be modified by an ordinary act of Parliament. *See also* **C7** (1).

Constitution of the United States. *See* **C27–29.**

Consul, the title borne by the two chief magistrates of the Roman Republic. Three consuls were appointed for France after the dissolution of the Directory in 1799, Napoleon becoming First Consul and holding the office until 1804, when he was made Emperor. Today diplomatic and commercial representatives abroad of sovereign states are styled consuls.

Continent, a word used in physical geography to denote the larger continuous land masses in contrast to the great oceans of the earth. They are: Eurasia (conventionally regarded as 2 continents, Europe and Asia), Africa, North America, South America, Australia, and Antarctica.

Contrabas. (*See* **Double Bass.**)

Contralto, the feminine equivalent of the male alto. Where altos and contraltos are present in the same choir they sing the same part. But, whereas the alto is the highest adult male voice, the contralto is the lowest female voice.

Conurbation, a term which has been defined as "an area occupied by a continuous series of dwellings, factories, and other buildings, harbours, and docks, urban parks and playing fields, etc., which are not separated from each other by rural land; though in many cases in this country such an urban area includes enclaves of rural land which is still in agricultural occupation." The term has been widely adopted for the contiguous densely populated areas which form continuous urban areas. The seven officially recognised in Britain are: Greater London, Greater Manchester, Greater Birmingham, West Yorkshire, Merseyside, Tyneside.

Convention is an assembly of delegates, representatives, members of a party met to accomplish some specific civil, social, political, ecclesiastical or other important object.

Convocation, an assembly called together to deliberate ecclesiastical affairs. In the Church of England the provinces of Canterbury and York each have their convocation.

Copper, one of the most familiar of metals, used in ancient times as an alloy with tin in producing bronze, and preceding iron as an industrial material. Copper ores are most abundant in the U.S.A., Chile, Canada, Northern Rhodesia, and the Belgian Congo. All copper compounds are poisonous. Copper sulphate is largely used in calico-printing and in the production of blue and green pigments.

Copts, members of the native Christian minority in Egypt. They belong to the Coptic Church, whose head is the Patriarch of Alexandria.

Copyright. Under the Copyright Act, 1956, copyright subsists in every original literary, dramatic, musical, and artistic work if the author is a British subject or a citizen of the Republic of Ireland or resident in the United Kingdom, or if the work is first published in the United Kingdom. The Act provides that, except in certain special cases, the author of the work shall be the first owner of the copyright, and there are no formalities, such as registration or payment of fees, to be accomplished. Copyright includes the right to reproduce the work in any material form, to perform the work in public, or, if the work is unpublished, to publish the work. The Act also protects sound recordings, films, and television and sound broadcasts. Literary, dramatic, musical, and artistic works which enjoy the protection of the Act are automatically protected in those countries which are parties to the Berne Copyright Convention or the Universal Copyright Convention. In general, copyright in literary, dramatic, musical, and artistic works is vested in the author for the period of his lifetime and 50 years following, after which it passes into the public domain and becomes freely available to any who wish to make use of it. The Copyright Libraries, entitled to receive *gratis* copies of books published in the United Kingdom, are the British Museum, the Bodleian at Oxford, the University Library, Cambridge, the Scottish National Library, Edinburgh, Trinity College, Dublin, and with certain exemptions the National Library of Wales. The Government Department responsible for matters in connection with copyright is the Industrial Property Department, Board of Trade, 25, Southampton Buildings, London, W.C.2.

Coral, a small marine animal closely related to the sea-anemone, but differing from it in two ways: corals move about when fully grown and develop a limy skeleton. They multiply chiefly by budding. The structure of the coral secretions assumes a variety of forms, fan-like, tree-like, mushroom shape, and so forth. Red coral (the skeleton of *Corallium rubrum*) is mainly obtained from the Mediterranean. The coral reefs of the Pacific and Indian Oceans are often many miles in extent. Living corals occur only in warm seas at about 23° C.

Cor Anglais (English horn = *corno inglese*). A tenor version of the oboe.

Cordite, a smokeless explosive adopted for small arms and heavy artillery by the British Government in the naval and military services in 1889, and composed of 58 parts of nitro-glycerine, 37 of gun-cotton, and 5 of vaseline. It is a jelly or plastic dough, and used in the form of sticks.

Cork, the bark of a species of oak grown largely in the South of Europe and North America. The cork tree is said to yield bark every six to ten years for 150 years, and grows to a height of from 20 to 40 ft. Its lightness and elasticity enable it to be used for a variety of commercial purposes, especially for stoppers of bottles.

Cormorant, a large, long-billed water-bird which captures fish by diving. It has bronze-black plumage with white cheeks and sides and is found around the sea coasts of most parts of the world, including the British Isles. It nests in colonies on sea cliffs and rocky ledges. The Shag or Green Cormorant is a smaller bird with green-black plumage and a crest.

Cornet, an instrument which is fundamentally a small trumpet. Its tone is neither so bold nor so powerful as that of the trumpet, and it is therefore of use in small orchestras whose balance would be upset by the inclusion of trumpets.

Corn Laws were statutes intended for the benefit of British agriculture, and generally prohibited export and imposed a duty on imported corn. From 1436 to the middle of the 19th century such laws were in force, and were often of a stringent nature. They became so oppressive and caused corn to reach so high a price that the poorer classes were plunged into distress. A powerful anti-corn law agitation was organised, of which Cobden, Bright, and Villiers were the leaders, and Sir Robert Peel, in 1846, passed an Act lowering the corn duty to 1s. per quarter. In 1869 this nominal duty was abolished by Robert Lowe in a Customs Duty Act. Since the second world war an effort is being made to control the acreage, purchase, and distribution of crops on a world-wide scale.

Coronae, series of luminous rings surrounding sun or moon produced by the diffraction of light by water droplets in the atmosphere. Usually seen when sun shines through altostratus cloud. The outside of the ring is red and the inside bluish. (*See* **Halo.**)

Coroner, an officer whose duty it is to hold inquests on the bodies of people who are suspected of having died from other than natural causes. He is usually both a lawyer and a doctor; an inquest takes the form of a legal inquiry, a court being constituted, with a jury, the coroner being the presiding officer. Fire inquests are held only in the City of London under a special Act of Parliament.

Corpus Christi Festival is one of the great celebrations of the Roman Catholic Church, and takes place on the Thursday after Trinity. It was instituted by Pope Urban IV. in 1264.

Cortes, the name of the Parliamentary assemblies of Spain and Portugal.

Cosmic Rays, a form of radiation coming from outer space, of deep penetrating power and of great scientific interest. The rays are believed to consist chiefly of particles endowed with positive electric charges, but how they are produced is not fully understood. Balloons have been sent into the upper atmosphere to study cosmic-ray bombardment (referred to in the Press as " flying saucers "), but these can rise no higher than 20 miles. The new space research techniques will make it possible to extend these investigations.

Cotton, the name of a plant of several species, bearing large yellow flowers with purple centres. These centres expand into pods, which at maturity burst and yield the white fibrous substance known as cotton. The raw cotton contains a large proportion of seeds which are removed by " ginning." Long before the Christian era, cotton had been grown and used with great skill in India to make fabrics. The industry was not introduced into England until the middle of the 17th century when Protestant refugees from Flanders came to settle in the wool textile districts of East Anglia and Lancashire. With improvements in machinery and expansion of overseas trade in the 18th and 19th centuries, Lancashire became the centre of the world's cotton industry. Since the first world war there has been a marked decline in Britain's cotton industry.

Counterpoint (adj. **contrapuntal**). The weaving together of two or more distinct melodies to create harmony.

County. The geographical counties of England are of very early origin and the word " county " was first introduced after the Norman conquest as an equivalent of the old English " shire." The 52 ancient or geographical counties of England and Wales should not be confused with the 62 administrative counties (created by the Local Government Act of 1888 when several of the geographical counties were subdivided) which themselves exclude the 83 county boroughs or towns with the status of a county. Scotland has 33 and Ireland 32 counties.

Coup d'Etat, a violent change in the government of a state carried out by force or illegally. Examples are the overthrow of the French Republic in 1851 by Louis Napoleon, who then became Emperor, and more recently the military *coups* in the Middle East which brought about the abdication of King Farouk of Egypt in 1952 and the assassination of King Feisal of Iraq in 1958.

Court Leet, a court of record held annually before the steward of any particular manor or lordship; originally there was only one court for a manor, but in the time of Edward I. it branched into two, the court baron and the court leet.

Crabs are familiar crustaceans, carrying a shell, breathing through gills, and are provided with ten external limbs or claws, the side and smaller limbs being used for walking, and the two front claws for grasping purposes.

Crane, a large, graceful wading-bird with elegant long legs and neck, greyish plumage, superficially resembling the heron and related to the bustard. They migrate in V or W formation and have trumpet-like voices. There are several species, found in all continents except S.

America, including the Crowned Crane with golden coronet and the Demoiselle with tuft-like crest of white feathers. The Common Crane nested in East Anglia in mediæval times but now comes only as a rare visitor from the Continent.

Creed, a brief enumeration of a particular belief or religion. The three important Christian creeds are the Apostles' Creed, the Nicene Creed, and the Athanasian Creed.

Cremation, the ancient custom, revived in modern times, of burning the dead. Many scientific men commend the practice on hygienic grounds, particularly in densely populated countries. Cremation was first legalised in Great Britain in 1885 and the first crematorium opened at Woking in that year. Application for cremation must be accompanied by two medical certificates. *See also* **Q14** (1).

Cricket, a genus of insects of the grasshopper order which move by leaps. The male produces a chirping noise by rubbing its wing-covers together.

Crimean War (1853–56). This war between Russia and the allied powers of Turkey, England, France, and Sardinia, was connected with the Eastern Question (*q.v.*) and the desire of Russia for a port on the Mediterranean. Chief engagements were the Alma, Balaclava, and Inkerman. Fighting virtually ceased with fall of Sevastopol in Sept. 1855. Treaty of Paris signed March 30, 1856.

Crinoids (Crinoidea). (*See* **Sea Lily.**)

Crocodile, the name of the largest existing reptile, and classed with the alligator and the gavial. The crocodile inhabits the Nile region, the alligator the lower Mississippi, and the gavial is found in many Indian rivers.

Cromlech, the name given to an ancient monumental erection consisting of a large rough stone placed on three or more upright stones and found in various parts of Great Britain and the Continent.

Crore (Hind. *kror*), an Anglo-Indian word meaning ten millions, used commercially to signify that number of rupees (100 lakhs).

Crosier, the staff, or crook, of a bishop carried before him on special episcopal occasions It is generally richly decorated in gilt at the top.

Crow, a family of birds including many well-known species such as the rook, raven, jackdaw, carrion crow, hooded crow, magpie, nutcracker, jay, and chough.

Crusades were military expeditions undertaken by some of the Christian nations of Europe with the object of ensuring the safety of pilgrims visiting the Holy Sepulchre and to retain in Christian hands the Holy Places. For two centuries nine crusades were undertaken: First, 1095–99, under Godfrey of Bouillon, which succeeded in capturing Jerusalem; Second, 1147–49, led by Louis VII. of France, a dismal failure, which ended with the fall of Jerusalem; Third, 1189–92, in which Richard I. of England took part, making a truce with Saladin; Fourth, 1202–4, led by French and Flemish nobles, a shameful expedition, resulting in the founding of a Latin empire in Constantinople; Fifth, 1217–21, led by John of Brienne; Sixth, 1228–29, under the Emperor Frederick II.; Seventh, 1148–54, under St. Louis of France; Eighth, 1270, under the same leadership, but cut short by his death on an ill-judged expedition to Tunis; Ninth, 1271–72, led by Prince Edward of England, which accomplished nothing. Millions of lives and an enormous amount of treasure were sacrificed in these enterprises and Jerusalem remained in the possession of the "infidels." The chief material beneficiaries were the Italian maritime cities; the chief spiritual beneficiary was the pope; but in literature and the arts both Europe and the Levant benefited enormously from the bringing together of the different cultures.

Crypt, a vaulted subterranean portion of an abbey, cathedral, or church, now generally used for burials or monumental purposes.

Cryptogam. A plant without flowers, as opposed to the *phanerogams.* The cryptogamic plants include the seaweeds, fungi, mosses, liverworts, ferns, and selaginellas.

Cuckoo, a well-known migratory bird which is found in Great Britain from April to July, and has a very characteristic note, uttered during the mating season only by the male. The hen has a soft bubbling call. It lays its eggs in the nests of other birds (the Meadow Pipit being the commonest foster-parent), but only one egg in each nest. Feeds mainly on insects, particularly hairy caterpillars.

Cuneiform, the term applied to the written arrow-headed characters found in Assyria, Persia, and Mesopotamia. Good examples may be seen in the British Museum, some of them several thousand years old.

Cupola, the inner portion of a dome. Famous cupolas are those in the Roman Pantheon, the Mosque of Santa Sophia at Constantinople, St. Peter's at Rome, and St. Paul's in London.

Curfew, the bell which William the Conqueror ordered to be rung at eight o'clock each night in the towns and villages of Britain, as a signal to the inhabitants to extinguish lights and go to bed. It originated in the fear of fire when most cities were built of timber. It was abolished in 1100, but at Ripon, Sandbach, Chesham, Penrith, Ibberton, Wokingham, it is still rung as a matter of custom.

Curlew, a wading-bird of which there are several species. It frequents marshy places, feeds on worms and insects, and possesses a very long curved bill.

Cutty Sark. The most famous of all sailing-ships; the last of the clippers built in 1869 at Dumbarton for the tea trade with China. She was a ship of outstanding performance (length 212·5 ft., extreme beam 36 ft., gross tonnage 963) and now rests on a permanent berth at Greenwich. Opened by H.M. The Queen to the public in June 1957.

Cybernetics (derived from the Greek word meaning "governor") is the American term for the science of automatic control by machines. The work of the American scientist, Dr. Norbert Wiener, has led to great advances in the construction of electronic computers and to interesting speculations in the field of sociology. (*See* **Calculating Machines.**)

Cyclone, a term usually applied to a tropical revolving storm. Cyclones often occur towards the end of the hot seasons and are mainly confined to tracks in the western areas of the oceans, being known as hurricanes (Caribbean and Pacific), cyclones (Indian Ocean), and typhoons (China Seas). The circulation of air in a cyclone is similar to that in the *depression* of temperate latitudes, but the region of low pressure is much more localised and the pressure gradients steeper. Winds of hurricane strength and torrential rain occur generally, although at the centre of the storm there is a small area, known as the "eye," where fair, calm weather prevails.

Cyclotron, or atom-smasher, invented by Dr. E. O. Lawrence (1901–58), at Berkeley, California, in 1930, is one of the basic research tools for fundamental work in atomic physics, designed to accelerate electrically-charged particles to energies corresponding to several million electron-volts. Other high-voltage accelerators are the synchrotons, cosmotrons, betatrons, bevatrons, etc. *See also* **F65–66.**

Cynics were a set of Greek philosophers, founded by Antisthenes, the pupil of Socrates. They held that virtue was the only good, and condemned arts, sciences, pleasures, and riches. Diogenes was the most famed of the cynics.

Czar was the title of the Emperor of Russia, and is derived from Cæsar. The first Czar was Ivan IV., crowned in 1547. The Czar's wife was styled Czarina, and his eldest son Czarevitch. The last Czar was Nicholas II., killed (July 1918) during the revolution.

D

Daboya, an Indian viperine serpent, venomous, and of nocturnal habits, of the genus *Daboia.*

Dace, a small freshwater fish of the carp family, of elegant shape and silver appearance. It is used as bait for pike.

Dacelo, a quaint-looking bird of the kingfisher order, common to Australia, one variety of which is known as the "laughing-jackass."

Dacoits, Indian brigands, or professional robbers, who were formerly very numerous and ter-

rorised the districts they infested, especially Lower Bengal. Mansingh, "the greatest dacoit of all time," was killed by the Uttar Pradesh police in 1955 after a manhunt lasting many years.

Dactyl, a measure in versification, consisting of a foot of three syllables, the first long, and the second and third short, as *lovingly, verily*. *See* **M3 (1)**.

Dactylopterus, a fish of the gurnard family, with wing-like pectoral fins; sometimes known as the flying fish, though that appellation is more generally given to *Exocœtus exiliens*.

Dado, a term denoting the portion of a pedestal between the base and the cornice; also applied to the lower part of the walls of a room when decorated differently from the upper part.

Dafila, a kind of freshwater duck, with long supple tail, found in Europe, Asia, and America. The pintail duck belongs to this genus.

Dagger-ale, a kind of liquor often referred to in 16th-century English literature, and sold at the sign of the Dagger in Holborn, a London house much frequented by the gallants of the time.

Dagoba, an edifice dedicated to the custody of relics of Buddha, and numerous in the temples of Ceylon and other Buddhist countries.

Daguerreotype, a first practical photographic process, invented in Paris by M. Daguerre during the years 1824–39. The light-sensitive plate was prepared by bringing iodine in contact with a plate of silver. After exposure a positive image came by development of the plate in mercury vapour. Even for open-air scenes the first daguerreotypes involved exposure of 5–10 minutes. The wet collodion process (1851) rendered the technique obsolete.

Dahabiyeh, a kind of boat much used on the Nile, broad at the stern and tapering off gracefully at the prow. It carries one or two masts and lateen sails.

Dail Eireann, the name of the national parliament of the Irish Republic.

Dalmatic, a wide-sleeved ecclesiastical vestment, reaching below the knee. Worn by bishops and deacons over the alb or stole.

Dama, the scientific name of the fallow deer, which is fawn coloured or brown, with white spots.

Damask, a figured textile fabric, made in various forms, with silk threads of many colours, as originally woven in the city of Damascus; in a combination of silk and wool or cotton; in linen only for table-cloths, etc.; or in cotton.

Damaskeening, the art of inlaying one metal upon another, largely practised in the East in mediæval times, especially in the decoration of sword blades. In its modern form it has been greatly developed.

Dandies, the name given to a class of exquisites prominent in early Victorian days, and who attracted attention by excessive regard for dress.

Danegeld, a tax imposed in England in Anglo-Saxon times to raise funds for resisting the Danes or to buy them off. Edward the Confessor abolished the tax, but it was revived by the Conqueror and subsequently retained, under another name, after the danger from the Danes was past. It is the basis of all taxation in this country. Domesday Book was originally drawn up for the purpose of teaching the State how to levy the tax.

Danelaw, the law enforced by the Danes in the kingdoms of Northumbria, East Anglia, and in the districts of the five (Danish) boroughs—lands grouped round Leicester, Nottingham, Derby, Stamford, and Lincoln—which they occupied during the Viking invasions of the 9th and 10th centuries. The country occupied was also called the Danelaw or Danelagh.

Darien Project was an unsuccessful scheme entered upon at the close of the 17th century by Paterson, the Scottish financier, for colonising the Isthmus of Darien and thereby diverting trade from the East in the direction of Scotland.

Darter, 1. A genus of birds of the pelican family, with long pointed bill and serpent-like neck and resembling cormorants in appearance. There are 5 species. 2. A family of small fishes.

Dartsnake, the name of a serpentine lizard of the Aconitas family, noted for the darting manner in which it attacks its prey.

Datary, a Roman ecclesiastical functionary, who acted for the Pope in all matters relating to the issuing of grants and dispensations; the dater or dispatcher of the Papal bulls.

Date Palm, a native of Northern Africa, where it is grown in great profusion. It is also known in Southern Europe and Western Asia to some small extent. It grows to 100 ft. and continues to bear for 2 or 3 centuries, its fruit being of great value as a food. From the leaves the Africans make roofs for their huts; ropes are made from the fibrous parts of the stalks; and the sap furnishes a stimulating beverage.

Dauphin, the title borne by the eldest sons of the Kings of France from 1349 to the Revolution of 1830.

"**Davy Jones**," a nautical term of a humorous turn supposed to apply to the spirit of the sea; it is said among sailors, when a person dies at sea, that he is committed to "Davy Jones's locker."

Day is the most natural unit of time and may be defined as the period of rotation of the earth relative to any selected heavenly body. Relative to the sun it is called the *solar day*. Relative to a fixed star it is called the *sidereal day*. Owing to irregularities in the earth's movements, the time taken for the earth to rotate through 360° relative to the sun is variable, and so the *mean solar day* of 24 hours has been introduced, which is the average throughout the year. The *mean solar day* is our standard, used for purposes of the calendar, and astronomers use *sidereal* clocks to check mean solar time. In practice, for convenience, the sidereal day is determined by the earth's rotation relative to the vernal equinox or first point of Aries, and is equal to 23 hours 56 minutes and 4·091 seconds of mean solar time (*i.e.*, about 4 minutes shorter than a solar day).

D.D.T. (dichloro-diphenyl-trichloroethane). One of the most powerful synthetic insecticides. Mosquito-breeding areas are now sprayed from the air.

Deacon, an ecclesiastical official, who assists in some of the smaller ministerial duties in church or chapel; in the Anglican Church he ranks below a priest.

Dead Languages are such as the ancient Greek and Roman tongues, which are no longer spoken but are preserved in literature.

Dead Sea Scrolls, a group of ancient Jewish documents, consisting of scrolls and fragments which have been recovered since 1947 in the vicinity of Qumran near the Dead Sea and which represent one of the most important finds ever made in the field of biblical archæology and Christian origins. The scrolls, written in Hebrew or Aramaic, were found in caves, the first by chance by an Arab shepherd in 1947. These consisted of biblical texts older by a thousand years than the earliest Hebrew manuscript of the Old Testament (A.D. 895). Many fragments have since been discovered, comprising the whole of the Old Testament with the exception of Esther. In addition there are commentaries and other non-biblical writings, including one called "The War of the Sons of Light with the Sons of Darkness." The writing on the scrolls indicates that they were written over a period of two centuries, the greater proportion before the birth of Christ. A nearby ruin is believed to have been the home of a religious sect to whom the scrolls belonged. By the aid of the latest scientific techniques, including radiocarbon tests, the age of the scrolls is being accurately determined.

Deal, the name given to planks of fir-tree wood of Northern Europe, 9 in. wide and 3 in. thick, 50 cu. ft. of which form a load, and 100 superficial ft. a square. An American deal, it should be noted, is 12 in. broad and 2½ in. thick, and of the uniform length of 12 ft.

Dean, a Church of England dignitary, ranking below a bishop, and the head of the chapter of a cathedral. A rural Dean supervises a *deanery* or group of parishes. There are also Deans of Faculties in some universities, and at Oxford and Cambridge the *Dean* is in charge of chapel services and disciplinary arrangements.

Death's Head Moth, a large insect, not uncommon in England, having on its thorax the outlined semblance of a human skull. It emits a peculiar, mournful sound when startled.

Death-watch. The so-called death-watch, with its mysterious ticking in the night-time, is due to nothing more serious than the furniture-beetle. The larva of this insect burrows in the furniture making the pinholes which are often to be seen in old furniture. It is three years in its pupa condition, and at last becomes a little brown insect with a great talent for shamming dead; so that it is not very much observed. These beetles often strike the wood of their galleries with their heads, and so produce a ticking sound which is a call to the mate. The ticking is most frequent in the summer months, but in warmed rooms it may be heard at any time.

Decade, the number 10, or a period of 10 years.

Decalogue, the Ten Commandments, which, as related in Exodus, were given by God to Moses on Mount Sinai, and contained on two stone tablets.

Decapods. Crustacea with ten (five pairs of) appendages: *e.g.*, lobsters, crabs, shrimps, and prawns.

December, the twelfth month of the year, and the tenth of the old Latin calendar. The Anglo-Saxons called it Mid-winter monath and Yule monath.

Deciduous Trees are such as shed their leaves, or "fall" at maturity, or at certain seasons, as distinguished from evergreens or permanent foliaged trees or shrubs.

Decimal System is based on the unit of 10. Fractional numbers are expressed as divisions of 10; thus the number 3·458 means $3+\frac{4}{10}+\frac{5}{100}+\frac{8}{1000}$. (*See* **Metric System.**) The decimal system is used to classify books in libraries. *See* **Books, Classification of.**

Declaration of Independence was an Act by which the American Congress, on July 4, 1776, declared the American colonies to be independent of Great Britain. "Independence Day" is a holiday in all the States and territories of the United States.

Decree Nisi, a law term used in regard to a Divorce Court decree which dissolves a marriage, if at the end of three months nothing arises to interfere with the decision, whereupon it is made absolute and the parties are free. *See* **D29**.

Deemster is the title of the two judges in the Isle of Man.

Defence Expenditure. The net U.K. Defence Estimates for 1960–61 amount to £1,617·83 million, after deducting expected receipts of £12 million from the Federal German Republic.

Defender of the Faith, a title conferred by Pope Leo X. upon Henry VIII. of England for his tract "Assertion of the Seven Sacraments" against Luther. Later it was withdrawn, but in 1554 was confirmed to him by Parliament and has since been used by English sovereigns.

Deliquescence, the process of liquefaction or dissolving by the absorption of moisture from the atmosphere. For instance, chromic acid crystals on exposure to the air quickly deliquesce.

Delta, a triangular tract of land between diverging branches of a river at its mouth, and so called from its general resemblance to the Greek letter Δ *delta*. The best-known examples are the deltas of the Nile, the Ganges, the Niger, and the Mississippi.

Deluge, a flood, a term commonly applied to the story of the Deluge contained in the Bible, in which Noah and the Ark figure. A similar tradition lingers in the mythologies of all the ancient nations.

Democracy is the condition of direct popular government—"by the people for the people"—the executive powers being vested in representatives elected by the people. *See also* **C6** (2).

Democratic Party of the United States is one of the two major parties, the other being the Republican Party. The party is sometimes regarded as the more liberal party in the U.S.A., but the difference is not a clear-cut left-and-right difference. The Democratic Party was the party of low tariffs and of the rights of the states (in opposition to the federalists). It was very strong in the Southern states which contained the slavery states and thus called "the solid South." The 20-year Democratic era of Roosevelt, who stood for the *New Deal*, and Truman, who stood for the *Fair Deal*, came to an end in 1952 when Gen. Eisenhower won the Presidential election for the Republican Party. *See also* **C28** (2).

Demoiselle, the Numidian crane, a wading-bird.

Denarius, a Roman coin, originally of silver, first coined in 268 B.C. It is the penny of the New Testament.

Dendiculus, a member of the moulding ornamentation of Ionic and also Corinthian entablatures, over the frieze and under the corona, but, properly speaking, because of its projection, part of the latter. It consists of a row of rectangular blocks, at regular intervals, resembling teeth; hence the name.

Dendrite, any stone or mineral on which appears natural tracery resembling trees, leaves, or flowers, the result of the action of the hydrous oxide of manganese.

Denier, an old French coin, and the chief silver coin of Europe during the mediæval period.

Density, a measure of the mass per unit volume of a material, usually expressed in grams per cubic centimetre. *Specific gravity* is the ratio of the density of a material at the temperature under consideration to that of water at the temperature of its maximum density (4° C.). In grams per cubic centimetre the density of gold is 19·3, silver 10·5, lead 11·3, water 0·99997, air 0·00129.

Deodand, the name given in old English law to a personal chattel which had been the cause of an individual's death. This chattel—it might be a cart that had run over and killed a man—was declared a deodand and forfeited to the king to be applied to religious uses. Deodands were abolished in 1846.

Deodar, a coniferous tree of the cedar order.

Depression, a region where barometric pressure is lower than that of its surroundings. These areas of low pressure enclosed by the isobars are usually less extensive than anticyclones and may vary from 100 to 1,000 miles in diameter. The winds, often of gale force when the depression is deep, blow round the system in an anticlockwise direction in the Northern Hemisphere (in the reverse direction in the Southern Hemisphere) and inwards across the isobars. The majority of depressions which cross the British Isles travel from the Atlantic, sometimes in series or families, at rates of between a few miles and 700 miles in a day, bringing their generally unsettled weather with them.

De Profundis (out of the depths), the first two words of the Latin version of the 130th Psalm, and commonly used to designate this psalm.

Derrick, the name of a special jib crane, for lifting and moving heavy weights. It was originally applied to a kind of gallows built by a Tyburn hangman called Derrick in the 17th century.

Dervish, a Mohammedan mendicant monk. There are many orders, including the "howling," "wandering," and "whirling" dervishes. Also one of the fanatical followers of the Sudan Mahdi.

Descant. An additional contrapuntal part, often much ornamented, woven in with an existing part. The vocal descant is one of the earliest uses of counterpoint.

Deserts, vast, barren, stone or sandy wastes where there is almost no rainfall and little or no vegetation. These regions are found in the interior of the continents Africa, Asia, and America between 20° and 30° north and south of the equator. Europe is the only continent without deserts. The most famous are the Sahara, the largest in the world, the Gobi desert of central Asia, the Kalahari desert of south-west Africa, and the great Australian desert.

Deuterium or "heavy hydrogen." The second isotope of hydrogen; the third is called tritium. Deuterium atoms have in their nuclei a neutron as well as a proton; tritium nuclei have two neutrons and one proton. In ordinary hydrogen gas about one out of every 5,000 atoms is a deuterium atom. Deuterium was discovered in 1932 by Professor Harold Urey. The oxide of deuterium corresponding to water is called "heavy water." The nucleus of the deuterium atom is called a deuteron.

Deuteronomy, the fifth book of the Pentateuch, purported to have been written by Moses, and containing the statement of the law, but regarded by many modern critics as of a much later period.

Devil-fish, a strange marine animal of large size and of several species. As it is met with in European waters it is called the fishing frog,

and the chief American species is the giant ray.

Devonian System in geology refers to the strata between the Silurian and the Carboniferous Formations. It includes the Old Red Sandstone Formation. The fauna of the Devonian include the group of fishes known as the Rhipidistra (on the evolutionary route towards the amphibians), Actinistia (cœlacanth), and the Dipnoi or lung fishes.

Dew, moisture deposited by condensation of water vapour on exposed objects especially during calm, cloudless nights. The loss of heat from the ground after sunset, by radiation, causes the layer of atmosphere close to the surface to be chilled below the temperature, known as the dew-point, at which the air is saturated with vapour. Part of the vapour condensed may be transpired from blades of grass and foliage of plants.

Dew Pond is a shallow artificial pond which is on high ground and rarely dries up, even during prolonged droughts, despite being used by cattle and sheep as a drinking source. The name arose from the belief that dew deposits at night provided the moisture for replenishment. Drainage of rain-water and mist condensed on neighbouring trees and shrubs are probably more important factors.

Dextrin, a white, odourless, viscid substance of the same composition as starch, from which it is obtained. It is used as gum, being the material put on the backs of postage stamps and other articles which are required to be made adhesive. It also is utilised in calico printing.

Dhole, the wild dog of the Deccan, of a bright bay colour, and living on game, which it hunts in packs.

Dhow, a one-masted trading vessel, much in evidence on the east coast of Africa and the Red Sea, and formerly employed in the transportation of slaves.

Diæresis, the sign (¨) placed over the second of two vowels coming together, and indicating that each is to be pronounced distinct from the other, as *aërated*; also employed to indicate that a vowel, ordinarily silent, must in this case receive pronunciation, as "Oh, cursëd spite," "My belovëd," etc.

Dial *or* **Sun Dial**, an instrument for telling the time of day by a shadow thrown on a marked surface. This was the first form of outdoor clock, and was introduced into Europe from the East. It is made in various forms—horizontal, upright, or inclined.

Dialect is a form of speech special to a locality or district, and differing from the general literary language of the country. In England these dialects are numerous, but in all of them some survivals from what was once good old English speech are to be found. From the works of Chaucer, Spenser, Shakespeare, and from even later writers, many words are to be read that are obsolete as regards modern literary expression, but are still familiar in dialect idioms. The dialect that has forced itself most into modern literature is the Scottish, a fact largely due to the compositions in dialect of Burns and other Scottish poets. For the full understanding of the force and meaning of English dialects, Professor Wright's monumental *Dictionary of Dialects* is to be commended.

Diana's Temple at Ephesus. The temple of Ephesus, built after the model of Karnak, was looked upon as the greatest of the "seven wonders of the world." Its interior length was 425 ft. its breadth 290 ft.; its roof was supported by 127 richly-sculptured pillars, each the life-work of a king. Originally erected by Ctesiphon, it was enlarged and enriched by every succeeding prince. On the day that Alexander the Great was born, Erostratus tried to destroy it by fire, and partly succeeded; the Ephesians rebuilt it, and the world at large contributed to its restoration. Some years later Alexander the Great commanded his engineers to improve and beautify it. At the entrance to this famous temple was placed the "Altar of Sacrifice." In the Adytum was a second altar, the "Altar of sweet herbs." At the entrance to the Penetralia was a third, the "Altar of sweet incense," on which only the richest and most costly perfumes were placed. The statue of Diana was behind purple curtains.

Diapason. The concord of the first and last tones of an octave and the fixed rule by which organ pipes are arranged to proper pitch. The open metal flue pipes which form the basis of an organ are called the diapason "stops." Their pitch is expressed in terms of length, *e.g.*, 4-ft. diapason, 8-ft. diapason, 16-ft. diapason. The pitch of other pipes is related to that of the diapason: *e.g.*, a trumpet, which is a reed stop, may be said to have an 8-ft. tone, *i.e.*, its pitch is the equivalent of an 8-ft. diapason.

Diaper, a figured textile fabric, the pattern of which is small and is shown in the material, without resorting to colour or differences of fibre. Many kinds of decorative products, treated in the same style, are termed diaper work.

Diatoms. One-celled algae, common in fresh and salt water. Distinctive feature is the siliceous wall which is in two halves, one fitting over the other like the lid of a box. These walls are often very finely and beautifully sculptured. The diatoms constitute the division of the plant kingdom known as the Bacillariophyta. *Diatom ooze* is a deep-sea deposit made up of diatom shells. *Diatomite* or *diatomaceous earth* is the mineral form that such diatom oozes assume (sometimes known as kieselguhr which mixed with nitroglycerine yields dynamite).

Diatonic Scale. The ordinary major and minor scales on which most European music is built, *e.g.*,

C major	C – D – E – F – G – A – B – C
Tone intervals	1 – 1 – ½ – 1 – 1 – 1 – ½
C minor	C – D – E♭ – F – G – A♭ – B – C
Tone intervals	1 – ½ – 1 – 1 – ½ – 1½ – ½

Dice, an ancient game played with small ivory cubes, each face of which is spotted with black marks like domino pieces, and thrown from a box held in the hand, the one who throws the highest number of spots being the winner. The Lydians played dice.

Dictator, the title given by the ancient Romans to their supreme magistrates under the republic, in times of great exigency. The term was limited to six months, but while it lasted the Dictator's rule was absolute. Another class of dictator was the Greek Tyrant, and many despotic rulers of more recent times, like Hitler and Mussolini, have been dictators. (*See* **Fascism**.)

Dictionary, a book containing the words of a language, alphabetically arranged, giving their definitions, and in many cases their pronunciation and etymological significance. The Greek word for dictionary was *lexicon*, hence lexicographer, someone who compiles a dictionary. Samuel Johnson (1709–84), known as the "Great Lexicographer," published his famous dictionary in 1755. The most elaborate of English dictionaries is the *New English Dictionary* (or the *Oxford Dictionary*), edited by Sir J. A. H. Murray, Henry Bradley, Sir W. A. Craigie, and C. T. Onions. This is the accepted authority for English spelling and pronunciation and is a large work of many volumes. The small *Concise Oxford Dictionary* is derived from it. The standard dictionary of America is *Webster's International Dictionary* (20th century), derived from Noah Webster's *American Dictionary of the English Language* (1828). There are also special dictionaries dealing with music, biography, etc.

Dies Iræ (the Day of Wrath), a famous 13th-century Latin hymn, sung at burial services, and taking its place in translated form in the English hymnology.

Diesel Engine. A compression-ignition engine. The air in the cylinder is compressed to over 500 lb. per sq. in. and its temperature is about 800° F.; oil injected into the hot compressed air ignites immediately. The modern oil engine has been evolved mainly from the principles enunciated by Herbert Akroyd-Stuart in his patent of 1890 and, like the steam and other inventions, represents the improvements achieved by many men, including those by Rudolf Diesel of Germany, in respect of high compression pressures and greater fuel economy.

Diet, an assembly of dignitaries or delegates called together to debate upon and decide important

political or ecclesiastical questions. The most famous Diets in history were those of Worms in 1495 and 1521, and the Diet of Augsburg of 1530, all of which dealt with matters of religious controversy awakened by the Reformation movement.

Diffusion is the process of mixing which occurs when two liquids or gases are in contact. It is most rapid between gases, and, as laid down by Graham's law, "the rates of diffusion of different gases are in the inverse proportion to the square roots of their relative densities."

Digit, a finger or toe. In arithmetic any number of one figure is a digit, the nine Arabic numerals being indicated by the fingers in counting on them, as one, two, three, four, five six, seven, eight, nine.

Dimensions are measured magnitudes and involve the qualities of length, breadth, and thickness. A line has only one dimension: length; a plane surface two; length and breadth; and a solid three; length, breadth, and thickness. *See* **N28.**

Dimorphism, the quality of assuming two distinct forms. For instance, carbon, which is graphite in one form, is the diamond in another.

Dingo, the wild dog of Australia, which is very like a wolf. It is of a reddish colour with a bushy tail and is very destructive to sheep.

Dinosaur, the name given to a group of extinct reptiles of the Mesozoic period, some of which were of immense size—much larger than crocodiles. (*See* **Diplodocus**.)

Diocese, a territory under the pastoral authority of a bishop. The term originated in the time of the Roman Empire, and represented then rather an administrative territory than an ecclesiastical one.

Diopside, a variety of pyroxene occurring in prismatic crystals, chemically calcium magnesium silicate. Two light-green varieties, malacolite and alalite, are gemstones.

Dioptase, or emerald copper, a scarce copper ore occurring in prismatic emerald green crystals, and composed of silicate of copper.

Diorama, a series of spectacular paintings exhibited in a darkened room with the light thrown on to the pictures in such a manner as to produce optical effects that give the appearance of reality. These effects can be varied so as to represent night, or day scenes, or scenes of cloud or sunshine, as may be desired. The diorama was the invention of Daguerre and Bouton in 1822, and was first shown in London in 1823.

Diorite, an igneous rock of crystalline structure composed of felspar and hornblende. It used to be classed as greenstone.

Dip Needle. Instrument for measuring the *dip* or inclination of the earth's magnetic field.

Diplodocus, one of the best known of the extinct mammoth dinosaurs, belonging to Mesozoic times. Fossil remains have been discovered in Colorado and Wyoming, and in 1905 a cast of one of these huge monsters, taken from the original in the Pittsburg Museum, was presented to the British Museum by Mr. Andrew Carnegie and is now at the Natural History Museum, South Kensington. It has been named the Diplodocus Carnegii, and is 84 ft. in length, having been reconstructed out of four defective skeletons all found in Wyoming. The height to the top of the spines of the dorsal vertebræ is nearly 14 ft.

Dipnoi *or* **Lung Fishes.** These have the air bladder adapted to function as a lung, and they can remain alive when the stream or marsh in which they live dries up. Species of lung fish occur in Australia, Africa, and S. America. (*See* **Devonian Systems**.)

Diptera, an order of insects. Their main characteristic is that they are two-winged, and the common house-fly is the best-known example. There are at least 50,000 species of these insects, including gnats, blow-flies, mosquitoes, tsetses.

Diptych was a folding two-leaved tablet of wood, ivory, or metal, with polished inner surfaces, utilised for writing with the style by the ancient Greeks and Romans. The same term was applied to the tablets on which the names of the persons to be commemorated were inscribed in the early Church. In art any pair of pictures hinged together is styled a diptych.

Directory, a term applied to the executive of the later French Revolution period, from Oct., 1795, to Nov. 9th, 1799, when Napoleon overthrew it and established the Consulate. The term, as in general use, signifies a book in which names of residents, traders, etc., in any particular locality or sphere are recorded, such as the London Post Office Directory, the Directory of Directors, etc.

Dirge, a hymn or song of mourning and lamentation, which may be music only, or a song only, but is usually a combination of music and words.

Dirk, an ancient Scottish stabbing weapon, dagger-shaped but much longer and heavier. It was usually worn in a scabbard.

Discus, a circular piece of metal or stone about 12 in. in diameter, used in athletic contests by the ancient Greeks and Romans. Throwing the discus was a very favourite game, which was deemed worthy of celebration in Myron's famous *Discobolus* (c. 460 B.C.–450 B.C.), the best copy of which is in Rome. (*See also* **G23** (1).)

Disestablishment is the withdrawing of State support from Church organisation. The agitation for the disestablishment of the Church of England has slumbered for some years past. The Irish Protestant Church was disestablished in 1869. An agitation for the disestablishment of the Church in Wales, carried on for many years, led to the passing of a Bill, and the Church was finally disestablished in 1919.

Disk, an astronomical term denoting the seemingly flat surface of celestial bodies as seen by the eye.

Dispensing Power was a right claimed by English kings of releasing any of their subjects from oaths and vows on payment of certain indulgence fees, but the Bill of Rights of 1689 abolished this privilege, and since then the Pope has been the only authority claiming to exercise such rights. The gross abuse of the dispensing power was one of the causes of the Reformation.

Displaced Person, a person uprooted from his home and living in a country foreign to that person. Before VE day it was estimated that there were in Europe 12 million D.P.s belonging to the United Nations. The numbers of D.P.s whose fate awaits solution are variously estimated and may be as high as 3 million.

Dissenters are those who decline to conform to the uses of the Established Church. All Nonconformist bodies, whether Protestant or Papist, are included in the term Dissenters.

Distaff, the staff of a spinning wheel, being a cleft stick on which wool, cotton, or flax was wound for spinning on the spindle. It was held between the left arm and the side. In olden times there was a "Distaff Day," which fell on the day after "Twelfth Day," so named because women were then supposed to resume their distaffs.

Distal, applied to the end of a limb or bone in anatomy, or to an organ in botany, farthest removed from the point of attachment.

Distillation, a process used to separate liquids of different boiling points. This is effected by placing the mixture in a distillation apparatus and heating. The liquid with the lower boiling point distils over first, the vapour being condensed and collected, forming the first *fraction*. With continued heating the second liquid reaches its boiling point, distils over and the mixture is said to be *fractionated*. Mixtures of liquids with close very high boiling points require more elaborate apparatus. Fractional distillation is a common process in the chemical industry, particularly in the refining of petroleum.

Divertissement, a short musical entertainment which is usually accompanied by dancing.

Divorce. *See* **D7** (1), **24–32.**

Docket, a summary copy of any decree; a brief list, or label; derived from dock, to curtail.

Docks are enclosed water spaces where ships rest while being loaded or unloaded, or waiting for cargo. The wet dock is simply for loading and unloading; the dry dock, or graving dock, is for overhauling and repairing vessels, and is so constructed that, after a ship has been docked, the water can be drawn off; the floating dock is a rectangular structure which is sunk beneath a ship and raises it. The largest series of docks in the world are those on the Thames, extending many miles. (Tilbury has one of the most-up-to-date docks.) Those of Liverpool are the next largest. The launching of big vessels of the *Queen Elizabeth* and *Queen Mary* type

renders a large increase of dock accommodation necessary. In July 1933 the world's largest dry dock at Southampton was opened by King George V. This dock is large enough to accommodate any ship afloat and is 1,200 ft. long, 135 ft. wide, and 50½ ft. deep.

Dodo, an extinct bird, giant and flightless, which lived on the island of Mauritius up until 250 years ago. Another species, the white dodo, lived on Réunion. Some reached exceptional sizes. By the end of the 17th century Mauritius, Rodriguez, and Réunion had all been colonised, and the dodo along with many other birds vanished forever because of their inability to stand up to man and the animals imported into the islands.

Dog-days, a period of 40 days (3 July–11 Aug.) when Sirius rises and sets with the sun. The ancient superstition, which can be traced back in Greek literature to Hesiod (8th cent. B.C.), was that this star exercised direct influence over the canine race.

Doge, the chief magistrate in the former republics of Venice (697–1797) and Genoa (1339–1797, 1802–5).

Dogfish, a well-known genus of fishes of the shark family, of small size, seldom more than 3 ft. in length. The flesh is sold as "rock salmon." The eggs are contained in horny cases called "mermaid's purses."

Dog Licences are necessary for household dogs of six months of age or over. The cost per dog is 7*s.* 6*d.*, and the licence can be obtained at any Post Office. Dogs for tending sheep or cattle, or for leading blind persons, are exempt.

Dogs. *See* **Z2–9.**

Dolce, a musical term indicating that the music has to be rendered softly and sweetly.

Doldrums, a nautical term applied to those areas of the Atlantic and Pacific towards which the trade winds blow and where the weather is calm, hot, and sultry but liable to change suddenly to squall, rendering navigation difficult. To be "in the doldrums" is to be "down in the dumps."

Dollar, unit of the monetary systems of the United States and Canada, and coined in gold and silver. Dollars are in use in many other countries, especially in the Republics of South America, and the word is derived from the German thaler. The U.S. dollar is worth about seven shillings English money compared with five shillings before sterling devaluation in 1949.

Dolomite, the name given magnesium limestone, the double carbonate of calcium and magnesium.

Doloroso, a musical term denoting a sorrowful or plaintive style of playing.

Dolphin, an ocean mammal of the whale family, from 6 to 8 ft. long, with a long, sharp snout, and of an active disposition. They abound in most temperate seas and swim in shoals. A few species live in large rivers (Ganges and Amazon). They can cruise for long periods at around 15 knots and produce bursts of speed in the region of 20 knots, the water apparently flowing smoothly past their bodies.

Dome, a large cupola, hemispherical in form, rising over the main building of a cathedral or other prominent structure. The finest existing dome, that of the Pantheon at Rome, is also the oldest, dating from the time of the Emperor Hadrian. It is 142 ft. in diameter and about the same in height. The dome of St. Peter's, in the same city, has a double shell, is 330 ft. high and 140 ft. in diameter. The dome of the cathedral at Florence is 139 ft. in diameter and 310 ft. high, and that of St. Paul's, London, has 3 shells and is 112 ft. in diameter and 215 ft. high. The circular reading-room of the British Museum has a dome 140 ft. in diameter and is 106 ft. high. The largest of its kind in the world was the aluminium dome of the Dome of Discovery on the Festival of Britain South Bank site (1951), 365 ft. in diameter and 93 ft. high.

Domesday Book is the famous register of the lands of England framed by order of William the Conqueror. According to Stowe, the name was derived from *Domus dei*, the name of the place where the book was deposited in Winchester Cathedral; though by others it is connected with doom in the sense of judgment. Its compilation was determined upon in 1084, in order that William might compute what he considered to be due to him in the way of tax from his subjects. William sent into each county commissioners to make survey. They were to inquire the name of each place, the possessor, how many hides of land were in the manor, how many ploughs were in demesne, how many homagers, villeins, cottars, serving men, free tenants, and tenants in soccage; how much wood, meadow, and pasture; the number of mills and fish ponds; what had been added to or taken away from the place; what was the gross value at the time of Edward the Confessor. So minute was the survey that the Saxon chronicler of the time reports "there was not a single hide, nor one vintage of land, nor even, it is shame to tell, though it seemed no shame to do, an ox, nor a cow, nor a swine was left that was not set down." The record, which did not take in Northumberland, Cumberland, Durham, and parts of Lancashire and Westmorland, was completed on Nov. 15, 1085, and was comprised in two volumes—one a large folio, sometimes called the Little Domesday, which deals with Essex, Norfolk, and Suffolk, the other a quarto, sometimes called the Great Domesday. The first is written on 384 double pages of vellum in one and the same hand, and in a small but plain character, each page having a double column. The quarto is written on 450 pages of vellum, but in a single column and in a large, fair character. The original is preserved in the Public Record Office. (*See also* **Danegeld.**)

Dominant, in music, the fifth tone of the modern scale, and the reciting tone in the Gregorian scale.

Dominicans, an order of mendicant preaching friars founded by St. Dominic in Languedoc in 1215 and confirmed by the Pope in 1216. The rule of the order was rigorous. The dress was a white habit and scapular with a long black mantle. This gave them the name of Black Friars. Their official name is Friars Preachers.

Don, originally a Spanish title of nobility, but now accorded as a courtesy title. Also applied to a person with an academic appointment at the Universities of Oxford and Cambridge.

Donjon, the keep, or inner tower of a castle, and the strongest and most secure portion of the structure. This was the last refuge of the garrison, and there was usually a prison on the lower floor, hence the name *dungeon*.

Don Juan, the legendary hero of many famous works, supposedly based on the life and character of the unscrupulous gallant Don Juan Tenorio of 14th-century Seville. The first dramatisation of the legend and the most famous is Tirso de Molina's *El Burlador de Sevilla*. Don Juan was also the subject of Molière's *Le Festin de Pierre*, Mozart's *Don Giovanni*, Byron's *Don Juan*, and José Zorilla's *Don Juan Tenorio*. The latter is played on All Saints' Day throughout Spanish-speaking countries.

Don Quixote, the "knight of the doleful countenance," the hero and title of Cervantes' classic novel of 16th-century Spain. Don Quijote de la Mancha, a gentle country gentleman of lofty but unpractical ideals, having read many chivalric romances, believes he is called upon to redress the wrongs of the world. Mounted on his nag Rosinante and accompanied by his companion Sancho Panza, a hard-headed and practical peasant, he sets out on his journeys of knight-errantry. *See also* **G46** (1).

Doonga, a rough kind of East Indian canoe, constructed from a single piece of wood, and carrying a square sail. Used chiefly in salt-collecting around the shallow waters of the Ganges.

Dormer, the name of a special kind of window projecting from a sloping roof, and of vertical form. Such windows were common to the architecture of the Netherlands, northern France, and Belgium from the 14th century, and form picturesque features of general architecture.

Dormouse, a small, squirrel-like rodent widely distributed throughout Europe and Asia, and living mainly on fruit and nuts. It is of nocturnal habits and sleeps through the winter.

Dort, Synod of, Assembly of the Dutch Reformed Church, convened in 1618–19, resulted in the adoption of Calvinism as the Reformed religion, and the condemnation of the teachings of Arminius.

Dot, a French term indicating the property which a wife brings to her husband on marriage, and is

usually settled on the woman, being her separate property, though the income from it may go towards the general household expenses.

Dotterel, a handsome bird of the plover family found in northern Europe and Siberia. Nests in the Cairngorms, the Grampians, and E. Ross. Very tame.

Double-Bass. The largest and deepest-toned instrument of the Violin family. The Violoncello corresponds with the vocal bass so that the pitch of the Double Bass has no vocal counterpart—hence its name.

Double-entendre, a corruption of the French phrase "double entente," and used in English to indicate a word or sentence of indelicate double meaning.

Doublet, a body garment worn by men from the 15th to the 17th century; at some periods with skirts and belt, at others padded at the hips and in the sleeves. In their later form, under the Stuarts, doublets were made without sleeves and formed a sort of vest.

Drachm (or **Drachma**), an ancient Greek silver coin and weight. One drachma was equivalent to six obols. The word has survived as the name of a weight: Avoirdupois, one-sixteenth part of an ounce; Apothecaries' Weight, one-eighth part of an ounce.

Draco, a northern constellation, the Dragon.

Drag. Term used in aerodynamics, for resistance offered by the air to the passage of a body moving through it. When speed of sound is reached drag increases abruptly about tenfold. *See* **F70** (1).

Dragoman, an Oriental term used to designate a guide or interpreter. In some regions it is not considered safe to travel without an attendant of this kind. They often assume larger responsibilities, however, and contract for the organisation of caravans and the carrying out of tours.

Dragon, a fabulous monster common to folk-lore in most countries; generally represented as a winged reptile, with fiery eyes and breath of flame. A dragon guarded the garden of the Hesperides; in the New Testament there is mention of the "dragon, that old serpent, which is the devil"; St. George, England's patron saint, is supposed to have overcome the dragon; mediæval legend abounds in dragons. In heraldry it has also a conspicuous place; and in China was the imperial emblem.

Dragonade, the term given to the series of persecutions of Huguenots in France in the reign of Louis XIV., just before and after the revocation of the edict of Nantes, dragoons being chiefly employed in the work. Since then the term has been used in reference to any onslaught on the people by soldiers.

Dragonet, the name of the fish of the *Callionymus* genus, beautifully coloured, and about a foot in length. They are common on the British coast and in the Mediterranean.

Dragon Fly, the common name of a well-known class of insects having two pairs of membraneous wings, and often of very brilliant colours. They are swift of flight and may be seen hovering over sheets of water in the sunshine all through the summer.

Dragon's Blood, a dark-red resinous substance obtained from the fruit of a Malay palm, and possessing medicinal virtues. In a special technique used for making line blocks in printing, dragon's blood is used.

Drama. The word *drama* comes from a Greek word meaning to do or to act, and it is from Greece that the play originates (at least, so far as the West is concerned). Plays have their origin in the long-ago past when players dressed up as various supernatural beings to perform rituals designed to make the gods carry out desired actions. Three or four hundred years B.C. such playwrights as Æschylus, Sophocles, and Euripides began to write plays partly religious and partly secular for the pleasure of their audiences: this was one of the greatest periods the theatre has seen, and such plays as *Œdipus Rex* and *Antigone* still give pleasure in our own theatres. Roman drama was of little significance in general, and the next important stage in the history of the theatre is the Catholic mystery play of the Middle Ages, which, at the time of the Renaissance, developed into the play as we know it now. In England the great Elizabethan playwrights Webster, Ford, Shakespeare were in the forefront of this movement. Cromwell disapproved of the theatre, and the next important stage is the Restoration Drama following the Restoration of the monarchy in 1660. The only European achievement comparable to that of Britain in the history of the stage is that of France with such great playwrights as Molière and Racine. In the 19th and 20th centuries the great playwrights have been Oscar Wilde, Shaw, and others in Britain; Pirandello in Italy; Ibsen in Norway; Strindberg in Sweden; Hauptmann in Germany; Chekov and Turgenev in Russia. There are signs that the drama in verse is once more becoming popular in this country with such writers as T. S. Eliot and Christopher Fry. A summary such as the foregoing cannot include the great dramas stemming from another tradition in Asia—the plays of Japan, China, and India.

Dramatic Unities, as prescribed in ancient times, comprise Time, Place, and Action.

Draughts, a game played with dark and light pieces on a chequered board. *See* **U11** (2).

Drawbridge, a bridge that can be lifted up so that no passage can be made across it. It was a usual feature of a fortified castle in the Middle Ages, and was raised or lowered by chains and levers. It spanned the fosse, and on the approach of an attacking party was raised and formed a special barricade to the gate. Modern drawbridges are such as are raised to allow of the passage of boats up and down a river or estuary. The Tower Bridge is a famous London bridge of this type.

Drongo. The King Crow or Indian Black Drongo is frequently seen in India perched on branches or telegraph wires, darting suddenly to catch insects. Other members of the family are found in Asia, Africa, and Australia. Its plumage is black with steel-blue gloss.

Drosophila *or* **Fruit Fly.** More has been learnt by geneticists from breeding experiments with this insect than with any other.

Dross, the name generally applied to the refuse of molten metal, composed of slag, scales, and cinders.

Drought, a period of dry weather, is a normal and recurring condition in many warm climates, and is frequently provided against by irrigation. In the British Isles really long rainless spells are somewhat rare, and an "absolute drought" is defined officially as a period of at least fifteen days on each of which the rainfall is less than $\frac{1}{100}$ inch. The summer of 1959 was wholly without precedent in all parts of Britain for lack of rainfall, abundant sunshine, and warm weather. In South Yorkshire an absolute drought lasted 59 days, the longest period in British records.

Druids, priests and learned men of Celtic Britain and Gaul. Little is known for certain about them, and the chief records come from Roman authors, notably Pliny and Cæsar. Worship of the sun, belief in special deities and in the immortality of the soul were the central features of their religion. The oak and mistletoe were sacred to them, and they are supposed to have offered human sacrifices. The Romans did much to stamp out Druidism in Gaul, but in Britain it yielded only to Christianity. The megalithic stones at Stonehenge were formerly ascribed to the Druids, but recent evidence suggests that the monument belongs to a Bronze Age culture (*c.* 1500 B.C.).

Drum. There are three main kinds of drum: the bass drum, the side drum, and the kettle drum.

BASS DRUM: a large shallow wooden cylinder whose ends are covered with skin or parchment rendered taut. It is used in a vertical position and beaten on both sides with padded leather hammers. Much used by military bands to beat out the rhythm of a march.

SIDE DRUM. A smaller version of the bass drum, sometimes with a metal body. It is used horizontally and played on the upper side with a pair of wooden drumsticks or, in dance bands, with a wire brush. Jazz-drummers use a combination of bass drum and several side drums on which complicated solo passages may be performed. To increase the rattle, strings of catgut may be strung across the lower parchment. The drum is then called a snare drum.

KETTLE DRUM: a large copper bowl whose mouth is covered with parchment. The tension of the parchment may be altered by means of hand-screws so that the drum may be tuned to a particular note. In a normal orchestra there are two kettle drums known collectively as the tympani.

Drupe is the scientific term for stone fruit. The stone forms the inner part (endocarp) of the fruit, and encloses a seed or kernel, the latter being liberated after setting in the ground by the decomposition of the shell.

Drury Lane Theatre is the oldest London playhouse. There was a theatre of the name in the Stuart period. It was destroyed by fire in 1671. The next theatre on the site was built by Wren, and burned down in 1809. The present house dates from 1812. Sheridan was its manager for a long time.

Dry-rot, the term was first used about 1775 to describe the fungal decay of timber in buildings. Creosote distilled from coal tar is the standard material for preservation of timber, and pentachlorophenol and copper naphthenate are two compounds now extensively used. Dry wood always escapes dry-rot. Chief fungi causing dry-rot are *Merulius* and *Poria*.

Dualism is a term used both in religion and in philosophy. In religion it involves the doctrine of two distinct principles, one good, the other evil, as the controlling influence; in philosophy it opposes materialism and idealism, and insists that spirit and matter are separate substances.

Dublin University *or* **Trinity College** was founded by Queen Elizabeth in 1591. Its library, built between 1712 and 1732, has over half a million books and a very fine manuscript collection.

Ducat, a coin formerly widely current on the Continent, first coined in Apulia in the 12th century. A gold ducat was worth about 9*s.* of our money, and a silver ducat half that sum.

Duck, water bird smaller than the related goose and swan, which together form the family Antidæ. Duck refers to the female, drake to the male. The duck family falls into two separate groups: the river or freshwater (surface feeding) ducks, such as the mallard, pintail, wigeon, shoveler, mandarin, teal, garganey; and the sea (diving) ducks, such as the goldeneye, pochard, scoter, eider, and the fish-eating mergansers or "sawbills." The ancestor of all domestic breeds, with the exception of the muscovy, is the mallard.

Duck-bill *or* **Ornithorhynchus,** a fur-covered mammal inhabiting Australia and Tasmania, possessing a bill like a duck and a body resembling that of a mole. Called also the duck-mole and the duck-billed platypus.

Ducking-stool *or* **Cucking-stool,** a stool in which common scolds, disorderly women, and dishonest tradesmen were formerly tied and plunged into water as punishment. Ducking prevailed from the late 15th century until the early 18th.

Ductility is a property possessed by most metals which renders them capable of being stretched without breaking. Gold is the most, and lead the least ductile of metals, the order being gold, silver, platinum, iron, copper, palladium, aluminium, zinc, tin, lead. In animated nature the spider and the silkworm, with their elastic secretions, are noted examples of ductility.

Duelling originated in France in the so-called days of chivalry. It is an encounter between two persons, with deadly weapons fought according to conventional rules and prearranged, with the object of settling a personal quarrel. There is no instance of a private duel in England before the 16th century. The Duke of Wellington fought a duel with Lord Winchelsea in 1829, and Castlereagh, Pitt, Fox, Sheridan, and Canning all took part in duels. Duels are frequently described in literature.

Duet. A musical composition for two voices or two instruments. A pianoforte duet may be performed by two players on the same instrument.

Dugong. A marine mammal, belonging to the order Sirenia (sea-cows). Inhabits Red Sea and Indian Ocean; also found as far East as the Philippines and Australia. Lives on seaweed. Related to the Manatee.

Duke, the highest rank in the British peerage next to that of a royal prince. Edward, the Black Prince, eldest son of Edward III., who died before his father, was the first English duke, being created Duke of Cornwall in 1337. Since that time all Princes of Wales have held that title.

Dukeries, a range of English woodland and park country, mainly in Nottinghamshire, comprising the adjacent demesnes of several English dukes and nobles. The Dukeries include Sherwood Forest and the estates of Welbeck Abbey, Clumber Park, Worksop Manor, and Thoresby Hall.

Dukhobars *or* **Doukhobars** (Russian = spirit wrestlers), a Russian religious sect founded in the 18th century and numbering many thousand followers. Their leader was Peter Veregin. They deny the divinity of Christ, interpret the gospels figuratively, believe in the equality of all men before God, and reject all authority, including that of the Government. They were severely persecuted in Russia and were befriended by Tolstoy. Many emigrated to Canada to settle in Saskatchewan and British Columbia in 1898–99, where they have become absorbed in the Canadian community and only occasionally get into trouble with authority over the education of their children and their ascetic practices (which include nudism).

Dulcimer. An instrument of stretched wires which are struck by hammers held in the hands. It is the logical precursor of the pianoforte.

Duma, Russian Parliament established by imperial ukase Aug. 19, 1905, consisting of representatives elected on a restricted franchise. Abolished by the Bolshevists in 1917.

Dunciad, Pope's famous satire in verse, in which he replied to the attacks of his enemies and denounced the critics and poetasters with scathing effect.

Dunes. Sand dunes are elliptical or crescent-shaped mounds of loose sand produced by wind action. The dune has a gentle slope on windward side; a steep slope on the leeward side.

Dunlin, very common small wading-bird of the Sandpiper family nesting in Britain. Its range extends to other areas where it also breeds.

Dunmow Flitch, a custom which originated in the parish of Little Dunmow, Essex, in the reign of Henry III., which was that the husband who was prepared to swear before the prior, convent, and townsfolk of Dunmow that he had not repented of marriage or quarrelled with his wife for a year and a day, should be rewarded with the gift of a flitch of bacon. The custom has frequently been abolished and revived.

Dunnock (*Prunella modularis*), a small bird of the countryside of rich brown and dark grey plumage. Sings a cheerful song all the year round. Called hedge-sparrow in southern England. Another member of the same family, the larger Alpine Accentor (*Prunella collaris*), is found on rocky mountain slopes of Europe and Asia.

Duodecimo, a sheet of paper folded into twelve leaves, written "12mo."

Durbar, a term used in India for a State reception, from the Persian word *darbár* meaning "court" or "audience." It may be either a council for administering affairs of state, or a purely ceremonial gathering. Native rulers of India received visitors and conducted business in durbar. The word was applied to great ceremonial gatherings like Lord Lytton's durbar for the proclamation of the Queen-Empress in 1877 and the Delhi durbar of 1911.

Durham University, founded in 1832, a federal university composed of two divisions, the Durham Colleges (5 men's and 3 women's colleges, 2 non-collegiate societies) and King's College, Newcastle upon Tyne.

Dust, solid particles of matter floating in the atmosphere, produced chiefly by volcanic eruptions, sand-storms in desert regions, and industrial and domestic smoke. When the island of Krakatoa erupted in 1883, more than 1 cubic mile of dust was thrown into the air and carried three times round the earth by the explosion wave. The particles in dust-storms are much finer than those in sand-storms and are swept up to far greater heights. The local whirlwinds which form over loose dry soils are termed dust-devils.

Dyke, the term applied to masses of igneous rock which have flowed into grooves of strata or be-

come infused therewith; the word also signifies in alternative usage, a sea-wall and an open drain.

Dynamite, a powerful explosive whose chief element is nitro-glycerine. It was discovered by Nobel in 1867, who absorbed nitro-glycerine in kieselguhr; has a disruptive force of about eight times that of gunpowder.

Dynamo. Machine for transforming mechanical energy into electrical energy. Depends on principle of electromagnetic induction whereby a current is produced in a conductor (*e.g.*, copper wire) traversing a magnetic field. The two essential parts of a dynamo are the conductors or *armature* and the *field magnets*.

Dynasty, a succession of monarchs of the same family, as the Carlovingian dynasty, the Bourbon dynasty, the Plantagenet dynasty, etc.

Dysprosium. Element discovered in 1886 by Boisbaudran: one of the rare-earth metals.

E

Eagle, large bird of prey with huge hooked bill, related to the buzzard, kite, hawk, harrier, falcon, and vulture, together forming the family Falconidæ. There are many species to be found throughout the world, the Golden, Imperial, Tawny, Spotted, and Lesser Spotted being found in Europe. The Golden Eagle, a magnificent-looking bird, nests in the Scottish Highlands, and the White-tailed Sea Eagle, which used to breed in Britain, is now only an occasional visitor. The eagle has been the symbol of royal power since the earliest times, and the American or Bald Eagle is the emblem of the United States.

Earl, a British title of nobility of the third rank, duke and marquis coming first and second. The title dates from Saxon times, and until 1337 ranked highest in our peerage.

Earl-Marshal, in England ranks as the eighth of the great officers of state, is head of the College of Arms, attends the sovereign in opening and closing the session of Parliament, arranges state processions (especially coronations) and assists in introducing newly created peers in the House of Lords. The office is hereditary in the family of the Dukes of Norfolk.

Earth, our habitable globe, is the third of the planets of the solar system in order from the sun, and on an average throughout the year takes 24 hours to turn completely round relative to the sun, the whole earth revolving round the sun in a slightly elliptical orbit once in a year of 365·2564 days. The mean distance of the earth from the sun is 93,004,000 miles. The shape of the earth is that of an oblate spheroid, its equatorial and polar axes measuring 7,926 miles and 7,900 miles respectively. The crust consists of an outer layer of surface soil of varying thickness, beneath which there is a mass of hard rock several miles deep, the percentage (by weight) of the principal elements present being oxygen 47, silicon 28, aluminium 8, sodium and potassium 5, iron 4·5, calcium 3·5, magnesium 2·2, titanium 0·5, hydrogen 0·2, carbon 0·2, phosphorus and sulphur 0·2. Mass of the earth is estimated to be 6,000 million million million tons. Two-thirds of the earth's surface is covered with water. It has only one satellite, the moon. A recent estimate of the age of the earth, based upon detailed study of the isotopic composition of lead ores, is 4,500 millions years. Recent discoveries suggest that the earth is embedded in the atmosphere of the sun and that some of the heat that reaches us from the sun gets here by direct conduction through interplanetary space. *See* **F8–9, 49**.

Earthquake, a sudden violent disturbance of the earth's crust; the region of the surface immediately above the "focus," or source where the earthquake originates, is termed the "epicentre." On account of their destructive power earthquakes have attracted attention from the earliest times, but accurate study dates only from the last century and the development of a world-wide network of recording stations from the present one. The majority of severe earthquakes result from fractures, usually along existing faults, in underlying rock strata subjected to great strains, the shearing movement sometimes extending to the surface. These dislocations set up vibrations which are propagated as waves throughout the bulk of the earth or round the crust. Frequently the main shock is followed by a series of smaller aftershocks. Minor local earthquakes may be attributed to the effects of volcanic activity, but most of the larger ones originate in non-volcanic regions along well-marked lines of weakness in the earth's crust. Generally the ground is felt to tremble, undergoing oscillations which may gradually or suddenly increase to a maximum and accompanied by sounds. Where there is movement of the sea-bed a tidal wave may result. One of the greatest of historic times was that which destroyed and flooded Lisbon in 1755. Among the notable shocks of the present century rank those of San Francisco (1906), Messina, Italy (1908), Tokyo, Japan (1923), Napier, New Zealand (1931), N.E. Assam (1950), South Ionian Is. (1953), Agadir (1960).

Earth Satellites. *See* **F47–49**.

Earthworm, of which there are several species, has a cylindrical body, tapering at both ends, and segmented into rings. It moves by contraction of its rings, aided by retractive bristles; is eyeless, but has a mouth, gullet, and stomach. Earthworms exist in immense numbers, and perform an important part in the scheme of nature by loosening the soil and rendering it more amenable to tillage. They also form a valuable food for birds and many mammals, and are unequalled as bait for certain kinds of fish.

Earwig, a genus of insects of the cockroach family, possessing two pairs of wings and anal forceps. It is of nocturnal habits, lives on vegetable matter, and hides by day under stones or bark. The old belief that it deliberately creeps into people's ears is altogether unfounded.

Easter, the annual Christian festival in commemoration of the resurrection of Christ, the English name being derived from Eostre, goddess of Spring. The date cannot fall earlier than March 22 nor later than April 25. Many disputes arose among the early Christians as to the proper time to celebrate this day which governs all other movable feasts. It was eventually ruled at the Council of Nicaea in 325 that Easter Day should be the first Sunday after the full moon following the vernal equinox. If this happens to be a Sunday, then Easter Day is the Sunday after. It should be remembered, however, that this moon is the paschal moon of the ecclesiastical calendar, quite imaginary, and generally one or two days ahead of the real moon we see in the heavens. In fact the reverend fathers at Nicaea did us a bad turn in having anything to do with the moon but then they had no Astronomer Royal to advise them of the complications. *See also* **N20**.

Eastern Question, a term formerly applied to the problems arising from the instability of the Mohammedan power of Turkey and its relations with the other nations of Europe. Later connected with other problems of the Near East, such as the possession of Constantinople and the position of the Balkan states.

East India Company was incorporated by Elizabeth in 1600. In 1613 the Company set up a factory at Surat, India, and in 1662 Bombay came under the Company's influence and developed into an important trading port. Dupleix wanted to establish French power in India and a struggle for supremacy took place. Clive gained the victory for England and thenceforward British dominion in India remained undisputed except by native princes. In 1772 Warren Hastings was appointed the first Governor-General and in 1784 Pitt's India Act established a Board of Control for the India Company. A great increase of trade resulted, and this rule continued down to 1858, when, as a result of the mutiny, the Crown assumed the sovereignty. With the passing of the Indian Independence Act of 1947, British dominion ended and India was handed back to the Indians.

Eau-de-Cologne, a popular distilled perfume first manufactured at Cologne in the 18th century by Johann Maria Farina, an Italian, and since made in large quantities in Cologne and elsewhere.

Ebony, a name applied to various hard black woods, the best of which are grown in Mauritius and Ceylon. There are also Indian and Ameri-

can varieties. Only the inner portions, the heartwood, of the trees are of the necessary hardness and blackness. Ebony is largely used in ornamental cabinet work, for piano keys, canes, etc.

Ecballium, the scientific name of the squirting cucumber, so named from the fact that when ripe it breaks from the stalk and ejects its seeds and juice from the hole made by the breakage.

Ecce Homo ("Behold the Man!"), used in reference to the pictures and sculptures representing Christ crowned with thorns.

Ecclesiastes, a book of the Old Testament, the word signifying "the preacher." Supposed to contain the reflections of Solomon, though many critics dissent from this view.

Ecclesiastical Commissioners. By a measure which came into force on April 1, 1948, the Ecclesiastical Commissioners and Queen Anne's Bounty were amalgamated as the Church Commissioners (which see).

Ecclesiastical Courts, dealing exclusively with Church affairs, are those of the Archdeacons, the Bishops, and the Metropolitan (York or Canterbury), with the Judicial Committee of the Privy Council as the final Court of Appeal.

Ecclesiasticus, the title of one of the books of the Apocrypha, dating from about 180 B.C. Its alternative title is "The Wisdom of Jesus, the Son of Sirach."

Echidna. The spiny ant-eaters of Australia and Tasmania. There are several species of these egg-laying mammals, which belong to the order Monotremata.

Echinodermata. The division of invertebrate animals which include star-fish, sea urchins, sea cucumbers, brittle stars, sea lilies (crinoids). The adults have a radial symmetry. *See* **F24** (2).

Eclipse, an obscuration of the light of the sun, moon, or other heavenly body by the passing of another body either between it and the eye or between it and the source of its light. The sun is eclipsed by the moon intervening between it and the earth; the moon by the earth passing between it and the sun. Total eclipses of the sun have occurred over parts of the British Isles in the years 1424, 1433, 1598, 1652, 1715, 1724, 1927, 1954 (visible from the Shetland Is.), and the next will be seen only from near Land's End on Aug. 11, 1999.

Ecliptic is the sun's apparent path in the sky; the great circle described by the sun from west to east in the course of a year. The sun is exactly on the equator on approx. March 21, and Sept. 23, and the points where the celestial equator and ecliptic intersect on these days are called the *equinoctial points*. On approx. June 21 and Dec. 22 the sun reaches its greatest and least midday elevation and its greatest distance north and south of the equator, and the points on the ecliptic on these days are called the *solstices*. (*See* **Seasons, N20.**) These four points are equidistant from each other by 90°. The equinoctial points are not fixed. The angle of inclination of the ecliptic to the equator is called the obliquity of the ecliptic, which is also variable, being influenced by the gravitational action of the other planets on the earth. At present the angle is 23½°.

Ecumenical Council. (*See* **Œcumenical Council.**)

Edda, the name given to two important collections of early Icelandic literature—*the Elder or Poetic Edda*, poems handed down from the 9th and 10th centuries, probably Norwegian in origin, and the *Younger* or *Prose Edda* of Snorri Sturluson compiled about 1230. They treat of mythical and religious legends of an early Scandinavian civilisation. *See also* **G38** (2).

Eddystone Lighthouse stands on a group of rocks about 9 miles from the Cornish coast and 14 from Plymouth. The present structure is the fourth that has occupied this dangerous position. The first was of wood, completed by Winstanley in 1700, but three years later washed away, its architect with it. In 1709 a second and stronger wood lighthouse was built by Rudyard. This lasted until 1755, when it was destroyed by fire. Smeaton built the third lighthouse, of granite and Portland stone, on the model of an oak trunk, and this, which was finished in 1759, withstood the storm and tempest for over a hundred years, being superseded by the present building, erected in 1879–82 by Sir James Douglas. It is wholly of granite. Its light can be seen over 17 miles, and in foggy weather it gives an explosive signal every 5 minutes.

Edelweiss, a white perennial flower of the daisy order, common in Alpine regions.

Edentata, the name given to an order of mammals which are without teeth in the front part of the jaws. Sloths, ant-eaters, and armadillos belong to this order.

"Edinburgh Review," the great Whig quarterly from 1802 until 1929, was edited by Jeffrey, and numbered among its contributors Lord Brougham, Sydney Smith, and Macaulay.

Edinburgh University, the youngest of the Scottish universities, was founded in 1582 by the town council and is now one of the leading medical centres of the kingdom. The present buildings were begun in 1789, and the library contains over 300,000 books and 8,000 MSS.

Eels, edible fishes of the order Apodes, with snakelike body covered with minute scales embedded in the skin. The common or freshwater eel *Anguilla anguilla* is found in the Atlantic coastal areas of N. America and Europe and in the Mediterranean, and breeds S.E. of Bermuda. The electric eel of S. America is a variety of great interest, possessing the power of emitting electric shocks. *See also* **F72.**

Egg-plant *or* **Aubergine,** a plant cultivated for its ovate fruit, varying in colour from dark purple to white.

Egret, a slender, graceful bird of the heron family, of pure white plumage, famed for its beautiful silky plumes (aigrettes), which appear in the breeding season, and for which it was ruthlessly hunted and would have been exterminated had not international action been taken to protect it. The Little Egret with black bill, black legs, and yellow feet breeds in the Mediterranean countries.

Egyptian Vulture is smaller than other vultures. Found in S. Europe, frequents native villages and scavanges for offal.

Eider, a large diving duck, found along the rocky coasts of northern latitudes, well known for the beautifully warm soft down, called "eider down," which the female bird plucks from her breast to line her nest. In Norway and Iceland the haunts of the eider are preserved and the birds protected by law on account of the much prized "eider down," which is collected from the nests just before the breeding season. "Eider down" is so elastic that a pound or two of it will fill an ordinary bed covering.

Eiffel Tower, built by the French engineer Alexandre Gustave Eiffel (1832–1923) for the Paris Exhibition of 1889. The tower which is made of iron is 985 ft. high and weighs about 7,000 tons.

Eikon Basilike (Royal Image), the title of a work issued in 1640, supposed to have been written by Charles I. in support of kingly divinity, and replied to by Milton in the same year with his *Eikonoklastes* (image breaker).

Eire (*or* **Eyre**), an old legal term still in use in Scotland in connection with the circuit of judges. Justices in eyre were judges journeying from assize to assize for the purpose of holding trials.

Eisteddfod (a sitting) was originally a congress of Welsh bards and minstrels, and dates from before the 12th century. These assemblies, discontinued for a long period, were resumed in 1819, and have been held yearly since, each lasting three or four days. Their object is to foster the Welsh patriotic spirit; they are devoted to orations and competitions in poetry, singing, and harp-playing, prizes being awarded to the successful contestants.

Eland, the largest species of antelope, a native of Africa; has large pointed horns, stands 5 feet high at the withers, and weighs several hundred pounds.

Elateridæ, a family of beetles of a numerous species with short legs and indented antennæ. Commonly known as Click-beetles or Shipjacks. Their larvae are the wireworms which cause so much damage to farm crops.

Elder, a genus of small trees of the *Sambucus* genus, with pinnate leaves, and bearing clusters of small purplish-black berries. The black elder, the best known, is common in most parts of Europe, and thrives in Britain. A wine is made from its berries, and the juice is used as an aperient.

El Dorado, a "golden land," was an idea much favoured in the days of the early Spanish explorers. It was believed that somewhere on the South American continent there was a country abounding in gold and precious stones. Many expeditions were fitted out to discover it. Sir Walter Raleigh also went forth on this illusive quest. The term is still used in regard to any place of rich promise.

Electric Light is light produced by electricity, and is of three kinds, the arc-light, incandescent light, and fluorescent light. The first is produced when a strong current passes between two carbon electrodes, first brought together, then slightly separated, leaving the current to continue, but setting up a resistance that causes the carbon points and the air between them to assume a white heat which gives forth an intense light, thus completing what is called the electric arc. The incandescent light is obtained by passing the current through a thin metallic wire or other strong resisting substance until it heats to the point of incandescence. In fluorescent lamps electrical energy is transformed into ultra-violet light, and visible light is produced when this falls on the fluorescent substances with which the lamps are coated.

Electric Telegraph may be said to date from 1836, when Sir Charles Wheatstone and his co-inventor Cooke introduced their Single-Needle instrument, which was soon followed by the Double-Needle apparatus. Morse, in 1837, invented his famous recording instrument. The first electric cable was between Dover and France, and was laid in 1850. The first Atlantic cable was laid in 1858, and the second in 1866. It was in 1899 that the first Marconi wireless telegraph messages were sent between England and France.

Electrolysis is the condition established when an electric current passes through a conducting liquid, between electrodes, connected with the poles of a battery, resulting in the decomposition and separation of the liquid, if a compound. Water thus becomes decomposed into hydrogen and oxygen.

Electrometer, an instrument for measuring differences of electrical potential. Unlike the magnetic or heating effects of an electric current, the electrometer is operated by electrostatic forces, there being no flow of current through the instrument. They are employed to make systematic measurements, near the earth's surface, of the potential gradient or strength of the atmospheric electric field.

Electron. All matter is pervaded by these tiny negatively-charged particles whose mass is about 9×10^{-28} gram. When current flows in a metal wire this represents a flow of electrons. All atoms contain electrons, but electrons can be isolated from atoms, as in cathode rays. The electron was discovered by Sir J. J. Thomson in 1897, which ushered in the era of modern physics. *See* **F10, 13.**

Electron Microscope. A microscope in which beams of electrons are focused by magnetic lenses in a manner analogous to the focusing of light beams in the ordinary optical microscope. Modern electron microscopes have very high resolving power and can magnify up to 1,500,000 times. *See also* **F58** (1).

Electronics. The science which deals with the behaviour and control of free electrons. It started with the discovery of the electron by Sir J. J. Thomson in 1897. The practical applications, constituting electronic engineering, have given us radio, radar, photo-electric cells, cathode-ray oscillographs, electron microscopes, computing machines, transistors, etc.

Electrophorus, a simple device for producing static electricity, consisting of a smooth disc of resin or ebonite mounted on a metal base and with a metal cover carrying an insulated handle. The disc is first electrified (negatively) by rubbing it with a dry catskin or flannel and the cover replaced, the upper surface receiving a positive charge and the lower a negative. On lifting off the cover, after having touched it with the finger, the negative charge leaks away to earth and the positive charge is isolated on the cover. The action may be repeated a number of times before it is necessary to replenish the original charge on the disc.

Electroplating is the process of coating metals or other substances with a metallic film, applied in a bath of the solution of the coating material by the action of an electric current.

Elements. In chemistry, an element is a substance in the simplest form to which it has been reduced. Ninety elements are found naturally on the earth, one is observed spectroscopically in the stars, and a further ten or so can be made artificially. Between them these elements can appear in some 1,200 different isotopes, of which 317 occur in Nature. (There are 274 stable isotopes among 81 stable elements.) *See* **F9** (2), **N30.**

Elephant, a proboscidian mammal of which only two species survive—the Asiatic, in India, and the African elephant. No other animals possess a trunk. Both males and females have large ivory tusks, of considerable commercial value. The Indian elephant is usually about 9 ft. high and weighs about 3 tons; African elephants are larger, weigh about 6 tons, and are usually much fiercer. Several fossil elephants of still larger bulk have been discovered, including the mammoth and the mastodon. The Indian elephant is domesticated and used as a beast of burden.

Eleusinian Mysteries, festivals common throughout Ancient Greece, agricultural in their symbolism.

Elf, a fairy personage who is supposed to interfere in human affairs with mischievous intent.

Elgin Marbles, a collection of ancient Greek sculptures and architectural fragments got together by the 7th Earl of Elgin and brought to England between 1802 and 1812. These celebrated treasures had originally formed part of the Parthenon at Athens, and were probably carved by pupils of the sculptor Phidias. Lord Elgin expended over £70,000 upon them, and they were purchased for £35,000 for the British Museum, where they can now be seen displayed.

Elk, the largest animal of the deer family, possessing enormous antlers, and standing, when mature, about seven feet high. The American moose is of the same family.

Ell, an old English cloth measure, representing a length of 45 in. It varied in other countries, from 22 in. in Saxony to 47 in. in France.

Ellipse, in geometry, a plane closed curve in which the sum of the distances of any point from the two foci is constant.

Elm, a stately, wide-spreading tree having some 20 species spread over north-temperate regions, several of which are native and peculiar to Britain. The grandest of the field elms is the English elm, *Ulmus procera*, which may reach a height of 140 ft. and a girth of 25 ft. The wych elm, *U. glabra*, or Scots elm, is a valuable hardwood and used in boat-building.

Elongation, an astronomical term for the angular distance from the sun at which a planet is observed.

Elzevir, the name of a celebrated family of Dutch printers, who produced editions of Latin, French, and German classics, which were highly valued for their beauty of type and accuracy of printing. They flourished in the 17th century.

Embalming, the process by which dead bodies are preserved from decay by means of spices and drugs. The art reached perfection in ancient Egypt, as the mummies which still exist so powerfully testify. In modern times many experiments in embalming have been tried, with various degrees of success.

Ember-days are set apart for fasting and prayer in the Western Church, at the periods appointed for ordination, viz., the Wednesday, Friday, and Saturday after the first Sunday in Lent, Whit-Sunday, Sept. 14 (Holy Cross Day), and Dec. 13 (St. Lucia's Day). They are of very ancient origin.

Embossing, the art of stamping in relief letters or designs upon pliant substances.

Embryology, that branch of biology which deals with embryos, tracing their development from fertilisation of the germ or seed to maturity.

Emerald. The rich green variety of beryl (beryllium aluminium silicate). The colour is due to the presence of chromium oxide.

Emery, a granular substance of the corundum order, generally mixed with other metallic substances, and used in a powdered state for polishing and grinding purposes. Emery stone is

chiefly found in Asia Minor and the Grecian Archipelago.

Emplectum, a kind of masonry used by the Greeks and Romans, consisting of walls built with hollow spaces between, which were filled in with rubble. Much used in fortification construction.

Empyrean, the highest heaven of the Ptolemaic system, and the supposed abode of the Deity.

Emu, large, flightless bird of Australia.

Enamel, a vitrified substance applied as a coating to pottery and porcelain. The art was practised by the Assyrians and Egyptians, and was introduced into Europe by way of Greece. Enamels are all either of the transparent or opaque kind, and are susceptible to an immense variety of colouring, according to the metallic oxides introduced.

Encænia, a festival commemorating a dedication: at Oxford University the annual commemoration of benefactors, accompanied by the conferring of honorary degrees, is held in June.

Encarpus, an architectural ornamentation consisting of sculptured representations of garlands or festoons of flowers or fruits, and generally wrought on friezes or capitals of columns.

Encaustic Tiles were much used in ancient times, as the evidences of ancient Rome and of the mediæval period in Europe generally clearly indicate. In modern times there has been a revival of this art, which has been very successful in many of the present-day examples of our own tile manufacturers, being more beautiful and durable than those of former times.

Encyclical Letters, a term used in reference to letters addressed by the Pope to his bishops upon matters of doctrine or discipline.

Encyclopædists, a term first applied to the eminent writers who collaborated in the French *Encyclopédie* (1751–65). These writers were Diderot, D'Alembert, Voltaire, Helvetius, and others, and their writings generally were sceptical as to religion, and destructive as to politics, and had great influence in popularising the social ideas which afterwards resulted in the French Revolution. *See also* **G50** (2).

Energy may be recognised in many forms: kinetic, potential, electrical, heat, chemical, radiant, and atomic energy. When energy disappears in one form it appears in others, in each case according to a fixed rate of exchange. (*See* **Work.**) Atomic energy is quite different from other forms of energy and is released when matter is actually destroyed, a small amount of matter giving rise to a relatively enormous amount of energy. During the war atomic energy research developed at great speed and culminated in the production of the atom bomb (*q.v.*) when a few pounds of uranium released energy comparable to that of 20,000 tons of high explosive. The hydrogen bomb has an explosive power nearly 1,000 times greater. For peaceful uses of atomic energy *see* **F51**.

English Language is composed of many elements. Anglian, Saxon, Norman French, Scandinavian, Dutch, and the various underlying contributions from Latin and Celtic sources. The result is a strong, expressive, composite language, now spoken by all races of English descent, and is the mother tongue of over 200 million people living in Britain and the Commonwealth and the United States of America.

Engraving is the art of cutting or otherwise forming designs of pictures on wood, stone, or metal surfaces for reproduction by some method of printing. Wood-engraving was the earliest in the field, dating from the 15th century. Later, engraving on steel and copper plates was introduced, and mezzotint, lithography, stipple, aquatint, etc. With the development of photography, and an increased knowledge of the use of acids, many readier methods of engraving were adopted, and now wood-engraving, which was formerly resorted to for all general engraving purposes, is comparatively little used. What is styled "process" engraving is the most utilised.

Ensign, a former title given to a commissioned officer of the lowest rank in a foot regiment, and so called because he was entrusted with carrying the colours or ensign. The rank was abolished in 1871. Officers of like rank are now styled second-lieutenants.

Ensilage, a method of storing and preserving fodder, vegetables, etc., in pits dug in the ground and excluded from air or light. The system was practised in ancient Rome and revived in England in the 19th century.

Entablature, that portion of a building which surmounts the columns and extends to the roof of the tympana of the pediments. It comprises three parts, the architrave, the frieze, and the cornice.

Entellus, one of the common monkeys of India, with a ridged forehead, a long tail, and whiskers and beard. It is regarded by Hindus as sacred, and enjoys immunity from injury at their hands.

Entomology is the study of insects. (*See* **Insects.**)

Entomostraca, a Crustacean sub-class, known as water-fleas, from their jerky method of progression.

Entozoa is a term used to designate generally internal parasites, such as intestinal worms.

Envoy, a special diplomatic agent deputed to represent a government at a foreign court, or to perform a special service, such as the negotiation of a treaty.

Enzyme. Organic catalysts which accelerate chemical processes occurring in living organisms. Examples are: *lipase*, which speeds the hydrolysis of fats; *diastase*, which is involved in the conversion of starch to glucose. Fermentation of sugars to alcohol requires the presence of the enzyme *zymase*. *See* **F25** (2), **59** (1), **P33** (2).

Epaulette, a shoulder badge fringed with cord, worn by English army officers until 1855; now confined to naval officers, and varying in form and richness according to the rank of the wearers.

Ephemoptera *or* **May-flies**, an order of insects. In the larval condition they exist from two to three years, but no sooner do they arrive at maturity than their lives are hurried to a close. They rise up in pyramids on warm summer nights, take no food, propagate, and perish. The Latin name expresses the fact that the adults have an ephemeral existence.

Ephesus, Councils of, were held in A.D. 431 and 449 to deal with heretical doctrines.

Ephod, a vestment worn by a Jewish high priest, and sometimes by priests of lower rank. In olden times it was of rich texture and set with gems.

Ephors were the five annually elected magistrates who exercised almost supreme authority in ancient Sparta; and later the office was adopted by the Romans. The last of the Spartan ephors existed in 225 B.C. when Cleomanes III. exterminated the existing magistrates and abolished the office.

Epic, a heroic narrative poem dealing with important events and introducing supernatural features; the most famous examples are Homer's *Iliad* and *Odyssey*, Virgil's *Æneid*, Ariosto's *Orlando Furioso*, Tasso's *Jerusalem Delivered*, and Milton's *Paradise Lost*. *See* **M12**.

Epiglottis, a lamella or cartilage designed to cover and protect the entrance to the larynx during the process of food swallowing.

Epigram, a term originally used to indicate a monumental inscription; afterwards applied to any concise and pointed specimen of verse, but in later times is applied to short, witty expressions in prose as well as verse. *See* **M10** (2).

Epilogue, an address, in prose or verse, delivered at the end of a play, and a usual accompaniment to the dramatic work of the 16th, 17th, and 18th centuries, but now fallen into desuetude.

Epiphany, a church festival celebrated on January 6, Twelfth Day.

Epoch, a period of time of such importance that succeeding years are numbered from it; an era is a succession of time, but an epoch is a point of time. Among the various epochs may be counted the birth of Christ and the Reformation. There are also the geological epochs, and epochs in arts, science, and invention, as well as in history generally.

Equator, the imaginary great circle of the earth, every point of which is 90 degrees from the earth's poles, and dividing the northern from the southern hemisphere. It is from this circle that the latitude of places north and south is reckoned. The celestial equator is the circle in which the plane of the earth's equator meets the celestial sphere.

Equidæ, the zoological term for the family of hoofed quadrupeds comprising two genera—*Equus*, to which the horse belongs, the *Asinus*, comprising the ass and zebra. In the Tertiary period there were several other species of Equidæ—*Hipparion*, *Protohippus*, etc.—of which fossil remains have been discovered.

Equinox, the time when the sun crosses the plane of the earth's equator, making day and night of equal length. *See* **N20**.

Equites, a body of ancient Roman cavalry, recruited from citizens of rank.

Eras are distinctive periods of time associated with some remarkable historical event or personage. The *Christian era*, dating from the birth of Christ, adopted for the reckoning of the years about the 8th century, was invented by the Christian scholar Dionysius Exiguus in the 6th century. It is now generally understood that the year A.D. 1 is put too late by four years. The *Jewish era* dates from 3761 B.C.; the *Julian era* from the alteration of the calendar by Julius Cæsar, 45 B.C.; the *Mohammedan era* from the date of the *Hejira*, or the flight of Mohammed from Mecca to Medina, which is A.D. 622, July 16, in the Gregorian Calendar.

Erbium. Element discovered by Mosander in 1842. Belongs to the group of rare-earth metals.

Erl-King, a forest fiend of German mythology, who lured children from their homes and carried them off. In Goethe's ballad the "Erlkönig" it is a traveller's child who is lured to destruction.

Ermine, a small animal found in northern latitudes, and abundant in Arctic America. Its coat becomes a lovely white in winter, the tip of the tail only remaining black. Its fur is highly prized.

Ernie, the name given to the "electronic random number indicator equipment", the electronic machine which selected the prizewinning numbers in the first Premium Bond draw held June 1–2, 1957.

Eros. This asteroid is 15–20 miles in diameter. It comes closer to the earth than any other member of the solar system with the exception of the moon and several very small asteroids. Determination of solar parallax based on observations of Eros in 1930–31 yielded the most accurate estimate of the distance of the sun from the earth (93,004,000 miles).

Erse, a term used by Lowland Scottish, and English writers for the Gaelic language spoken in the Highlands of Scotland. Sometimes erroneously applied to Irish, the Gaelic language as spoken in Ireland and revived as an official language in recent times. Dr. Johnson, Sir Walter Scott, and other writers used "Erse" to signify Scottish Gaelic. The language of the Scottish Lowlands (that used by Robert Burns) is related to the English language and not to Gaelic and is variously termed Scots, Braid Scots, the Doric, the Scottish vernacular, and, fashionably of late, Lallans.

Escapement is the contrivance by which the pressure of the wheels in a watch or other timepiece is accommodated to the vibratory action of the pendulum or balance-wheel, providing the regulating power which maintains an even impulse in spite of irregularities caused by friction or air resistance.

Escarpment, the face of an abrupt cliff or hill; also a portion of fortified ground whose edge is cut away almost vertically to prevent the enemy from climbing.

Escurial *or* **Escorial**, a magnificent palace built in the 16th century by Philip II. of Spain at a village 26 miles north-west of Madrid. In addition to a palatial residence it has a fine Doric church, a valuable library, and the royal mausoleum, the burial-place of the kings of Spain.

Escutcheon, a shield-shaped surface called a field, upon which a man's armorial bearings are represented. A woman's escutcheon is lozenge-shaped.

Esoteric, a term which had its origin in the teaching of Aristotle, but in later times has been applied to such doctrines as are intended only for privileged students or those of the inner circle.

Espalier, lattice work upon which to train fruiting or ornamental trees.

Esparto Grass grows in great abundance in Spain and North Africa, and the pulp is largely used for paper-making as well as for other purposes.

Esperanto, an artificial international language created by L. Zamenhof of Warsaw and first published in 1887. It does not seek to replace national languages but to serve as a second language for international communication. It is based on the internationality of many words in the principal modern languages, and is entirely phonetic in spelling and pronunciation.

Eskimoes, the people of the Arctic regions. They dwell in skin tents in summer and snow *igloos* in winter and live by hunting, fishing and trapping.

Eskimo Dog, a very hardy animal of great utility to the inhabitants of the Arctic regions as sledge-drawers. In appearance it suggests the Pomeranian, but is of a larger breed and has a wolf-like head.

Esquire, formerly a title applied to a young man of noble birth who attended on a knight and carried his shield. The title ranked next below that of knight and was applied to the eldest sons of knights and the younger sons of peers. Later it became a courtesy title and given to any man as a mark of respect.

Essenes, a Jewish sect which established itself in the 2nd century B.C. near the Dead Sea. They lived a spiritual and ascetic life according to "the love of God, of virtue and of man." They had no personal possessions and bathed every morning. The claim has been advanced that Jesus and John the Baptist belonged to this sect.

Essential Oils are oils derived from plants by distillation or expression, and much used in perfumery as well as to some extent in medicine.

Estate Duty is the duty payable upon the value of all property which passes or is deemed to pass on the death of any person. As from July 30, 1954, not exceeding £3,000, nil; £3,000–£4,000, 1%; £4,000—£5,000, 2%; £5,000—£7,000, 3%; £7,500—£10,000, 4%; £10,000—£12,500, 6%; rising gradually to 80% on estates exceeding £1,000,000. The 1960 Budget proposed that there should be graduated relief for gifts made more than two, three, or four years before death of 15%, 30%, and 60% respectively, to take effect for deaths occurring after 4 April 1960.

Estates of the Realm in Great Britain are the Lords Spiritual, the Lords Temporal, and the Commons. They are the great classes invested with distinct political powers, and whose concurrence is necessary to legislation.

Etching, a process of engraving, on copper usually, the design being drawn with a steel needle, and the lines produced by the action of an acid or mordant.

Ether, a volatile liquid, composed of carbon, oxygen, and hydrogen. It is a valuable anæsthetic obtained by heating alcohol with sulphuric acid.

Ethics, the science of moral conduct and duty. Aristotle, Plato, Kant, Bacon, Hobbes, Paley, Whewell, Hume, Bentham, Locke, Mill, and Herbert Spencer have all contributed to the development of Ethics, the last-named being the most illuminating of exponents of a clear ethical system.

Ethide, a compound formed by the union of an element with the monad radical ethyl.

Eton College, a famous school for boys, near Windsor, founded 1440.

Etruscans, people believed to have come from Asia Minor who colonised Italy about 900 B.C., settled in what is now Tuscany and part of Umbria, reached the height of their civilisation about 500 B.C., and were ultimately absorbed by the Romans. They were skilled technicians in bronze, silver, and goldwork, and excelled in the art of granular decoration. *See* **G24**.

Etude. (*See* **Study.**)

Etymology treats of the science and structure of words, including classification and derivation.

Eucalyptus, an Australian tree that grows to a great height, and possesses remarkable properties. It exudes a valuable gum, has a fibrous bark, and yields an oil from its leaves which is of great use in bronchial affections.

Euphonium, alternative name for the Bass Saxhorn in B♭. A large brass instrument of the trumpet type played by operating three valves.

Eurasian, a half-caste or person of mixed European and Asiatic parentage.

Europium, element discovered by Demarcay in 1906. A member of the rare-earth metal group.

Evaporation is the process by which a solid or liquid is resolved into vapour by heat. As it is rarely that the atmosphere is completely saturated, evaporation is nearly always going on at the surface of the earth, especially over the sea and other water surfaces, the vapour rising and, being lighter than the air, forming clouds which afterwards break, the vapour thereupon falling to earth again as rain. The same process occurs over smaller surfaces, the rate of evaporation being dependent on the general atmospheric conditions.

Everest Expeditions. For many years after Mt. Everest had been shown to be the highest mountain in the world, political conditions in Nepal, lying south of the summit, and in Tibet, to the north, prevented mountaineers from attempting an ascent. At last in 1921 the Tibetan authorities gave permission, and the first expedition, organised, as were all subsequent British expeditions, by a joint committee of the Royal Geographical Society and the Alpine Club, and led by Col. C. K. Howard-Bury, was sent out. This was primarily a reconnaissance; besides mapping the northern flanks, it found a practicable route up the mountain. By 1939, six further expeditions had climbed on the northern face. Some were baulked by bad weather, others by problems previously little known, such as the effect of high altitudes on the human body and spirit. Nevertheless, notable climbs were accomplished. In 1924, for example, Col. E. F. Norton reached 28,163 ft., and it was on this expedition that G. L. Mallory and Andrew Irvine were seen going well at about the same height. They never returned, however, and what disaster befell them is not known. After the war, political conditions again closed the Tibet route: permission was eventually obtained from the Nepalese Government to make the attempt from the south. In 1951 a reconnaissance expedition under Eric Shipton reached the ice-fall at the exit of the Western Cwm (a high valley lying south-west of the massif), and reported favourably on the prospects for an ascent. The first attempt from this side was made the following year by a Swiss expedition led by Dr. E. Wyss-Dunant, two members of which made an attempt on the summit, but were stopped at approx. 28,200 ft. by the intense cold and the very strong winds. When the British 1953 Expedition, led by Col. (now Brig. Sir) John Hunt, was being organised, stress was laid on three main points; proper acclimatisation of the climbers; use of oxygen for the final stages; and the establishment of very high altitude camps, so that the final assault parties would set out fresh and unencumbered. Great attention was also paid to recent developments in diet, clothing, and equipment. In all these matters the 1953 expedition was able to draw on the accumulated experience of their predecessors. By the end of April, a base camp had been established below the ice-fall, and with the aid of thirty-four Sherpa porters supplies had been carried up into the Western Cwm. The next critical stage was the ascent of the steep head of the cwm, the Lhotse face, with the threat of avalanches always present. By most strenuous efforts, a camp was established on the South Col (25,800 ft.) on May 21. From this camp on May 26, T. D. Bourdillon and R. C. Evans climbed the South Peak of Everest (28,720 ft.), then the highest altitude ever attained. On May 28, Edmund Hillary and the Sherpa leader, Tenzing Norkey, spent the night at the highest camp (27,900 ft.) and on the following day, May 29, climbed to the South Summit, negotiated the difficult final ridge, and reached the summit of Everest—the climax of a long, arduous, and stirring endeavour.

Evolution, in the words of Sir Julian Huxley, is "a natural process of irreversible change which generates novelty, variety, and increase of organisation." The theory, as laid down by Darwin, is that all existing species, genera, and classes of animals and plants have developed from a few simple forms by processes of change and selection. Up to the time of Darwin a large part of the civilised world believed that life had been created suddenly at the beginning of the world which God had created, according to Archbishop Usher, on 22 Oct. 4004 B.C. The evidence of the rocks, however, has given a more convincing theory of creation, and by studying the fossils preserved in the various layers of the earth's crust the past history of the earth's life has been pieced together. Darwin has been called the Newton of biology. *See* **Section F** (Part II).

Excommunication, exclusion from the rights and privileges of the Church. It is of two kinds—the major, which means a total cutting off, and the minor, which shuts out only from participation in the Eucharist. In mediæval times, major excommunications were often launched against rulers and leaders.

Exchequer, which derives its name from the checkered table on which accounts were calculated in early Norman times, is a term connected with the revenues of the Crown. The Court of Exchequer Division existed up to 1881. In former times it had jurisdiction in all revenue matters. The term Exchequer is now mainly applied to the Governmental department which deals with the public revenues, and is presided over by a Chancellor, who is also a Cabinet Minister.

Existentialism. An anti-rational modern philosophy best known through the literary works of the Frenchmen Jean-Paul Sartre and Camus. As a philosophical movement, it dates back to the German Heidegger (rector of a university in Nazi Germany), Kierkegaard, the 19th-century Danish theologian, and even Dostoievsky. There appears to be no consistent body of belief, and existentialism is mainly concerned to express an emotional attitude to the universe. Man, it is inferred, is a failure, unacceptable to Nature; he is, and always must be, imperfect. Sartre (an atheist) considers that the world is meaningless, there is nobody to help human beings in their predicament—they must help themselves. "Man is what he makes of himself." If a man is able to realise that he is abandoned to the tyranny of Fate, absolutely alone, and can count only on his own powers, then he will find freedom and greatness in this knowledge. Each individual must be free to make of himself what he can; everything is permitted to him within reason. Kierkegaard, on the other hand, was a Christian who believed that the intellect must be crucified—Christianity is not a belief, it is a form of relationship with God. There must be a defiant affirmation of God. This belief, often called Christian existentialism, has influenced such theologians as Brunner, Barth, Haecker, and others. The only consistent beliefs which appear to be accepted by all existentialists are: (1) defiance of reason and science; (2) an excessive individualism—an assertion of the right of each man to make himself in whatever way he thinks best.

Exoterics, the opposite of esoteric, is the term applied to doctrines openly expounded.

Exotics are plants of tropical origin not fully acclimatised.

Exploration. Modern exploration began in the second half of the 15th century with the voyages of the great Portuguese and Spanish discoverers. They were followed by sailors of other European nations, who profited from their developments in navigation and from their charts, and in less than one hundred years the coast-lines of much of the Americas, Africa, and south-west Asia had been revealed and the globe circumnavigated. The motives of these early explorers were mixed: they were seeking adventure, trade, plunder, national power, and the conversion of the heathen. Few if any were directly interested in advancing scientific knowledge. But from the reports of their voyages and travels, scholars at home compiled descriptions of the strange new world which stimulated their successors to undertake more systematic enquiries. One of the earliest English expeditions to be despatched for scientific research was that of William Dampier on the *Roebuck*, which was sent out by the Admiralty in 1699 to examine the coasts of North-west Australia. In the 18th century British explorers were at work mainly in the Pacific Ocean, with the object of

breaking the Spanish monopoly of trade. Capt. James Cook sailed thither in 1769 to observe first the transit of Venus at Tahiti, and then to search for the alleged great southern continent. On this voyage he discovered and charted much of the coasts of New Zealand and the east coast of Australia. On his second voyage he was the first to sail across the Antarctic Circle, and he showed that the southern continent was much smaller than had been supposed. By 1800 the general outlines of the continents, except for Antarctica were known, and explorers in the 19th century were largely engaged in opening up the interiors. In Africa British explorers solved two problems which had puzzled men for centuries: Mungo Park and Richard Lander established the true course of the River Niger, and Sir Richard Burton, J. H. Speke, Sir Samuel Baker, and others revealed the true sources of the Nile. The greatest African explorer of that age was undoubtedly David Livingstone, the missionary, who in three great journeys explored the Zambesi and the region of the Great Lakes, spreading the Gospel, fighting the slave trade, and opening up the interior to settlement and trade. In North America Alexander Mackenzie was the first to cross the main breadth of the continent from sea to sea. In Asia motives were also mixed; men like Charles Doughty, who explored in Arabia, and Sir Francis Younghusband, who journeyed from China to India across the Gobi and the Himalaya, were impelled by a love of adventure and the quest for knowledge, but political considerations were often involved. In recent years, with the main features of the world's surface known, exploration has become more intensive. Teams of scientists go out to study restricted areas in detail. An Antarctic expedition can contribute to our knowledge of world weather, or by biological research into the life history of whales, can help to improve our food supplies. Similarly, expeditions in Africa can help to check the loss of valuable agricultural land through soil erosion, or to develop areas of settlement by schemes for irrigation and power. And there are still great areas to be adequately mapped. All these problems are inter-related, and in solving them the modern explorer can call on many improved techniques and instruments—the aeroplane, the aerial camera, tracked motor vehicles, radio, in fact all the resources of modern science. But the human element is still vital, and for those with the old explorers' spirit there will always be problems left to solve.

Explosives are substances which burn to produce gases in such great volume that an explosion is induced. Gunpowder was the first explosive to be used; Roger Bacon's powder, consisting of charcoal, sulphur, and nitre, was the only practical explosive for centuries. 1845 brought gun-cotton, made by treating cotton with a mixture of sulphuric and nitric acids; but it was not until 1865 that Sir Frederick Abel perfected the process of manufacture that made it safe enough to store and use. In 1867 Alfred Nobel discovered how to make dynamite by absorbing nitro-glycerine in kiesulguhr; in 1886 he produced cordite, evaporating a solution of gun-cotton and nitro-glycerine in acetone, the resultant jelly being squeezed through jets to form cords. Cordite came into general use as a propellant. High explosives, providing bursting charge for shells and bombs, include: T.N.T. (trinitrotoluol), picric acid (known as lyddite, melinite, etc.), cyclonite (R.D.X.). Chemical explosives have been eclipsed by the atomic explosives, Uranium 235 and plutonium; 1 kilogram ($2\frac{1}{5}$ lb.) of Uranium 235 is equivalent to about 20,000 tons of T.N.T.

Extreme Unction, the final sacrament of the Roman Catholic and Greek Churches, administered to a dying person, and consisting of the anointing with holy oil, after confession and absolution.

F

Fabian Society, a society of British socialists established in 1883. George Bernard Shaw, H. G. Wells, Beatrice and Sidney Webb became its leading personalities. The Fabians stood for a non-Marxian, evolutionary socialism and believed in the "inevitability of gradualness". It is affiliated to the Labour Party and has a strong intellectual influence on the Labour movement.

Fables are fictitious narratives intended to enforce some moral precept, and may be either in prose or verse, and deal with personified animals and objects or with human beings. Æsop in ancient times and Hans Christian Andersen and the Brothers Grimm (in many of their stories) in later days, have given fables. Mention must also be made of La Fontaine's and Krylov's fables.

Faience, a kind of decorated glazed earthenware invented in Faenza, Italy, about the end of the 13th century. Wedgwood-ware is a notable example of modern faience.

Faille, a light fabric used for veiling material and other purposes of adornment. In the Middle Ages the name was applied exclusively to long veils worn by nuns.

Fairies are imaginary creatures supposed to be invested with supernatural powers. At one time a general belief in them was prevalent, especially amongst the peasantry, and the uncivilised races still existing cling to similar ideas. It was fancied that the world of fairyland was composed of good and evil spirits, variously embodied, always contending for supremacy, and exercising good and bad influence over humankind. If a person was lucky it was the work of the good fairy, if unfortunate the evil fairy was the cause. Early literature is crowded with the denizens of fairyland—fairies, elves, fays, sylphs, sprites, gnomes, goblins, genii, and so forth. Shakespeare's *Midsummer Night's Dream* is a fairy world of its own, and Spenser's *Faerie Queen* is a still more separate and distinct creative effort. Among the fairies of the domestic order, "Robin Goodfellow" was much talked of in England; as the "Banshee," with its warning apparition, was peculiar to Ireland; while the "Brownie," who rendered nocturnal help in household affairs, was more special to Scotland.

Fairs were established in mediæval times as a means of bringing traders and customers together at stated periods, and formed the chief means of distribution. The great English fairs of early times were those of Winchester and Stourbridge near Cambridge. Traders from the Netherlands and the Baltic gathered there with the great merchants of London, and goods of every kind, wholesale and retail, were sold. The British Industries Fair is the modern counterpart of the mediæval trade fair. One of the biggest trade fairs was at Nijni-Novgorod, founded in the 17th cent.; other big continental fairs are those of Leipzig (founded in the 12th cent.), Lyons, and Prague.

Fairy Rings are the circles caused in grassland by certain fungi. The circles expand outwards as the fungus spreads and at the advancing margin there is a ring of lush vegetation, and inside this, where the fungus is most dense, a ring of dead plants. Farther inward where the fungus is dying there is again a belt of strong vegetation. In olden times these rings were held to be the scene of fairy dances.

Fakirs are Mohammedan or Hindu mendicants who are held in great regard in India. There are two classes: those who are strict devotees to the principles of Islam and are called dervishes (*q.v.*); and those who are unattached to any religious order, but are simply wandering beggars—or itinerant so-called "holy men." Some of the more fanatical fakirs commit self-mutilation, and pride themselves upon their wretchedness.

Falange, the ruling party in Spain which came to power as a result of the Nationalist revolt against the Liberal Government, which gave rise to the Civil War of 1936. All power is vested in the Leader (El Caudillo), General Franco.

Falchions were a kind of sword, generally curved, used by the Roman soldiers, and afterwards adopted by other nations.

Falcon, name given to diurnal birds of prey which belong to the same family, *Falconidæ*, as the hawk, eagle, buzzard, kite, and harrier. They are swift of wing and feed on birds and small mammals. These birds have long, pointed wings, strong, hooked and notched bill, long,

curved claws, and an eye of great power. They are found all over the world. Those that breed in Britain are the Kestrel (the most common), Hobby (one of the swiftest of European birds), Merlin, and Peregrine, a swift and magnificent bird with slate-grey back, blackish crown, black "moustache" and whitish breast. Other members of the family are the Gyr Falcon from northern latitudes, Iceland and Greenland, which is a winter visitor to Britain, the Lanner, Saker, Eleonora's falcon, Red-footed falcon, and the Lesser Kestrel. The Gyr Falcon and the Peregrine were used in the sport of falconry in olden times. Because of its fearlessness and larger size, the female bird was used. When the quarry was sighted, the bird was unhooded, set free, and after mounting high into the air would dart swiftly down to strike the prey. The heron was the usual victim.

Falculia, a black-and-white bird only found in Madagascar, possessing a bill shaped like a sickle.

Fall-out. Radiations produced by nuclear explosions which may cause bodily and genetic damage. (1) *Local fall-out*, due to the return to earth of larger particles, occurs locally, and within a few hours after the explosion; (2) *Tropospheric fall-out*, due to particles which remain in the troposphere and come down within a month or so, possibly all over the world, but within the altitude in which the explosion occurred; (3) *Stratospheric fall-out*, which comes from fragments taken up into the stratosphere and then deposited, in the course of many years, uniformly all over the globe.

Fallow Deer, received its name from its fallow or yellow colour. It is smaller than the red deer, and has cylindrical antlers with palmated ends. It is native to many parts of Europe.

Falsetto, tones of a voice, particularly the male voice, which are pitched higher than the natural tones of the voice. Used in choral singing by male altos.

Fandango, a lively Spanish dance executed by two persons, who usually mark time with castanets.

Fantail, a variety of the domestic pigeon; also a genus of Australian birds of the *Muscicapidæ* family. A small New Zealand bird is called a fantail.

Fantasia, a composition for orchestra or solo pianoforte which is not bound by the rules governing formal compositions, *i.e.*, symphonies, sonatas, etc.

Fantoccini, or marionettes, were first introduced in Italy, where they are still popular. Our English "Punch and Judy" descended from this source.

Fan Tracery, a complicated style of roof-vaulting, elaborately moulded, in which the lines of the curves in the masonry or other material employed diverge equally in every direction. It is characteristic of the late Perpendicular period of Gothic architecture, and may be seen in St. George's Chapel at Windsor and the Chapel of Henry VIII. at Westminster Abbey.

F.A.O. (**Food and Agricultural Organisation of the United Nations**). *See* **C18** (1).

Farmer-General, the name given to any of the numerous aristocrats who in the days of the old French monarchy farmed certain taxes, contracting to pay the Government a fixed sum yearly, on condition that the specified taxes were collected and appropriated by themselves. The revolution of 1789 swept Farmers-General away.

Farthingale, a hoop of whalebone worn beneath a woman's skirts for the purpose of extending them, fashionable in the 16th and 17th centuries. The crinoline of the 19th century was a partial revival.

Fascism, a movement which started in Italy in 1918 under the leadership of Mussolini to suppress Socialism. The Fascist party came into power in Italy in Oct. 1922, following the March on Rome. In Germany the Fascist party came into power in Aug. 1934, when Hitler began to exercise supreme and uncontrolled authority, following the death of President von Hindenburg. Fascism is a doctrine which sets the State above the individual and gives supreme power into the hands of one man. It flourishes in times of great depression. It seeks to destroy parliamentary democracy and working-class movements, is nationalistic in sentiment and in the past has not shrunk from using any means to achieve its ends. Italian fascism derived its name and emblem from the Latin word *fasces* (= bundles). The *fasces* were the axe and bundle of rods carried by the Roman lictors before praetors, consuls, dictators, and emperors and symbolised the discipline and authority of the state.

Fata Morgana, the name given to a curious mirage often observed over the Straits of Messina, attributed to the magic of the fairy Morgana, half-sister of King Arthur, who was fabled to live in Calabria.

Fathers of the Church were early writers who laid the foundations of Christian ritual and doctrine. The body of their writings includes important controversial works, legal codes, histories, topographies, and speculations of a scientific and philosophical nature. The earliest were the Apostolic Fathers, some of whom were contemporary with the Apostles. The next in order are the Primitive Fathers of the 2nd and 3rd centuries, including Justin Martyr, Clement of Alexandria and Tertullian. The later Fathers were of the 4th and 5th centuries, among them being Athanasius, Basil, John Chrysostom, and St. Augustine.

Fats are important foodstuffs. In physiology they constitute a valuable form of reserve food. They contain carbon, hydrogen and oxygen; chemically they are described as esters of glycerol (glycerine). Commonest fats are stearin, palmitin, and olein, esters formed by the combination of glycerol with stearic, palmitic, and oleic acid respectively. Fats are converted into soap by alkali; this process (saponification) also releases glycerol.

Fault, a term designating a breakage coupled with displacement of geological strata.

February, the second month of the year, comprising ordinarily 28 days, but in leap years extending to 29 days. When first introduced into the Roman calendar by Numa about 713 B.C. it was made the last month of the year and preceded January. It was not until 450 B.C. that it was made the second month.

Federal Union. *See* **C22** (2).

Federation. (*See* **Confederation.**)

Félibrige, a movement founded in 1854 to revive the ancient glories of Provence, initiated by the French poet Fréderic Mistral.

Felidæ, the scientific name of all mammals of the *Carnivoræ* order which walk upon the tips of their toes, and embracing the members of the cat family, from the lion downwards.

Fellahs *or* **Felaheen,** are Egyptian labourers, agricultural chiefly, and form the lowest class of the community, possessing little or no political status. They are of Nubian, Coptic, and Arab descent.

Felo-de-se, one who deliberately and while in sound mind destroys himself.

Felspar, the name given to a group of minerals, silicates of aluminium, which make up probably more than half of the earth's crust. It is formed in granite and other rocks, both igneous and metamorphic.

Felucca, a long narrow vessel with two lateen sails; occasionally propelled by oars and used on the Mediterranean for carrying light merchandise.

Fencibles, a body of volunteer cavalry organised in 1794 for service within the United Kingdom. It comprised over 14,000 men, was of great utility during the invasion panic of that period, and seems to have been the forerunner of the yeomanry cavalry.

Fenestella, the niche set apart on the south side of the altar for the piscina in Roman Catholic churches.

Fennel, a plant cultivated for its aromatic seeds, which are of considerable utility as a medicament; also used for salads and garnishing.

Fens are low-lying lands covered with water, or of a boggy or marshy nature. The Fen districts of England are chiefly in Lincolnshire and Cambridgeshire, but in recent times most of the Fen land has been drained and cultivated.

Fermentation, the action of chemical ferments or *enzymes* in bringing about chemical changes in the materials of living animals and plants.

Ferret, a carnivorous animal of the Pole-cat family, with a pointed head and long sinuous body, well adapted for following rabbits and game into their burrows and hiding-places, it

being kept in this country for that purpose. It is a native of Spain and Africa, and does not exist in England in a condition of natural freedom. *See* **Z12**.

Feudal System existed in England from the Saxon period down to the end of the 13th century. It was a military and political organisation, based on land tenure, the land being divided into feuds or fiefs, held on condition that certain military duties were performed; and, in default of this, the land reverted to the superior lord. Feudal tenures were abolished by statute in England in 1660, although from 1495 they had practically been inoperative. The system was not abolished in France until the Revolution of 1789. There was a feudal system in Japan as late as 1871.

Feu de Joie, the discharge of guns to denote public rejoicing.

Feuilleton, a French term for a serial story or other light literature occupying the bottom portion of a newspaper page, and adopted in England to some extent in recent years, several of the daily journals now running serial stories.

Fieldfare, a member of the thrush family, a regular winter visitor to Britain. It is of a reddish-brown colour with spotted breast and is about ten inches long.

Field-Marshal, the highest ranking title in the British army, and only bestowed on royal personages and generals who have attained great distinction. The first British Field-Marshal was created in 1736, when John, Duke of Argyll, had the title conferred upon him by George II.

Fiery Cross, a call to arms used in the Scottish Highlands in olden times, and consisting of a wooden cross, which, after being set on fire and quenched in goats' blood, was carried blazing to and fro among clansmen to rouse them to action.

Fife. A small flute with a compass of about two octaves used only in military drum-and-fife bands.

Fifth Column. When Franco, the Spanish dictator, revolted against the Spanish Republic in 1936 and attacked Madrid with four armies, he declared that a group of fascists within the city was assisting the besiegers. The term is used to describe a body of spies behind a fighting front.

Fifth-Monarchy Men were a fanatical Puritan sect which proclaimed about 1645 that the Millennium was near at hand, when Christ would come to earth again and establish the Fifth Universal Monarchy. They were dispersed by Cromwell in 1653, but in 1661 revived and became a menace to the public peace, and 11 of them were arrested and executed.

Figaro, a well-known comic character in drama and opera, invented by Beaumarchais, adopted by Mozart, and the name of a popular paper of Paris.

Fighting-Fish, small pugnacious Siamese fish with long anals and ventrals of five rays. They are kept in glass globes in Siam, and when brought into contact will fight to the death, these encounters being the occasion of much gambling.

Filibuster, a name first given to pirates and buccaneers in the 17th century, who took possession of small islands or lonely coast lands, and there maintained themselves apart from any governing authority. In later times the term was used to specify men taking part in expeditions whose object was to appropriate tracts of country, and settle upon them in disregard of international law. The most notable expeditions of this kind in modern times were those of Narcisco Lopez against Cuba in 1850–51, and of William Walker against Nicaragua, between 1855 and 1860. Both leaders were captured and executed. The term is also used to express the right of a minority in the United States Senate for unlimited debate, which is used on occasions to delay legislation for an unlimited period.

Filigree, the name given to a class of ornamental work done with threads of gold or silver, or with fine wire, and frequently attached to apparel or decorative objects. It was made by the ancient Greeks, and in the Middle Ages was greatly in vogue, and reached a high standard of artistic beauty. It is still made in certain parts of Italy and Portugal.

Filioque, the part of the Nicene Creed which proclaims that the Holy Ghost emanates jointly from Father and Son, and is styled the doctrine of the "double procession." It is generally accepted in the Western Church, but is rejected in the Greek Church.

Finches, a large family of small birds belonging to the Passerine or perching order of birds. There are about 200 species, including greenfinch and hawfinch, chaffinch, goldfinch and siskin, bullfinch, crossbill, linnets and twites, buntings and the house-sparrow.

Finial (*archit.*), the ornamental apex of a spire, pinnacle, or gable, and of Gothic origin.

Fir, a cone-bearing tree with small evergreen leaves and of considerable use as timber. There are four leading varieties—the Silver Fir, the Norway Spruce, the Larch and the Lebanon Cedar. All these firs attain to a considerable height, and all yield turpentine or other resinous material.

Fire-Fly, a small winged insect which is able to throw out a strong phosphorescent light in the dark. There are some remarkable specimens in tropical countries.

Fire of London, of 1666, extended from East to West, from the Tower to the Temple church, and northward to Holborn Bridge. It broke out in a baker's shop in Pudding Lane, and lasted four days, and destroyed 87 churches, including St. Paul's Cathedral, and many public buildings, among them the Royal Exchange, the Custom House, and the Guildhall. In the ruins were involved 13,200 houses and 400 streets. The plague had not disappeared from London when the fire occurred.

Firkin, a former measure of capacity, the fourth part of a barrel, now only used in reference to a small cask or tub for butter, lard, tallow, etc.

Firman, a document of authority issued by Oriental governments granting any special privilege or concession, containing a command or installing a new officer, or conveying protection like a passport. The decree is issued by the ruler and signed by one of his ministers.

Fischer-Tropsch Process. A process for making synthetic petrol from carbon monoxide and hydrogen. The synthesis is accelerated by cobalt-thoria and nickel-thoria catalysts.

Fish Louse. Parasitic crustacea found on marine and fresh-water fishes.

Fission, Nuclear. A nuclear reaction in which the nucleus of an atom (*e.g.*, uranium 235, plutonium) captures a neutron, and the unstable nucleus so produced breaks into two nearly equal fragments and throws out several neutrons as well. In biology the term fission is applied to reproduction by fragmentation of a single-cell organism, as in amœba. *See* **F11** (1), **50** (2).

Flabellum, an ecclesiastical fan, formerly employed to drive away flies from the chalice during the celebration of the Sacred Mysteries; the flabellum was usually formed of the tail-feathers of the peacock.

Flagellants were a fanatical sect which sprang into notice at Perouse in the 13th century during a time of plague. They held processions and flogged themselves as they walked naked about the streets until they bled. They declared that sins could not be remitted without such practices. The sect continued down to the 16th century, in spite of their being declared heretics by Pope Clement VI., and 90 of them being burnt at the stake.

Flageolet. A sweet-toned instrument which is in effect a portable organ pipe whose length, and therefore pitch, may be varied by opening or closing holes in the pipe with the fingers. Sometimes called the English Flute or "Penny Whistle."

Flag Officer, a British naval officer who enjoys the right of carrying a flag at the mast-head of his ship, and is of the rank of Admiral, Vice-Admiral, or Rear-Admiral.

Flagship, the ship that flies the Admiral's flag, and from which all orders proceed.

Flamen were priests of ancient Rome dedicated to the service of particular deities, such as those of Jupiter and Mars, and were always of patrician birth.

Flamingo, a strangely beautiful, extremely slender wading bird of white and rose-pink plumage with long, slender legs and neck and a long,

down-curved bill with which it rakes the mud and obtains its food of worms and molluscs. The wings are bright crimson, bordered with black, and a flock in flight is a picture of singular beauty. There is a large and famous colony in the Camargue.

Flash-Point. This is found by heating an oil in a special cup and taking the temperature at which sufficient vapour is produced to ignite when a small flame is applied. It is an index of the inflammability of oils.

Flat. A keyboard instrument has white keys and black keys. The notes played by the white keys are called "naturals." There are eight of these to each octave and they are called A, B, C, D, E, F, G, A. The black key immediately below a natural (one semitone interval) is called its "flat," *e.g.*, the black note below B is B flat and is written B♭. Conversely the black key above a natural (one semitone interval) is known as its "sharp," *e.g.*, the black note above A is A sharp and is written A♯. Since B natural is a full tone above A natural, it follows that B flat and A sharp are the same note.

Flax, a textile fibre obtained from the flax plant, which is an annual, and is largely cultivated for commercial purposes, being grown in Russia, Germany, Italy, Holland, and the North of Ireland. After undergoing various preparatory processes, the flax is spun into yarn and woven into linen fabrics.

Flea. Fleas are small parasitic insects belonging to the order *Aphamptera* (so called because these creatures have no wings). They obtain their food by sucking blood from their host. They are laterally compressed, which immediately distinguishes them from lice. The human flea (*Pulex irritans*) is able to jump vertically a distance of over 7 in.

Fleet Prison, a noted debtors' prison that stood in Farringdon Street, London, where the Congregational Memorial Hall now stands, taking its name from the Fleet Ditch. Notorious for the cruelties inflicted on prisoners. It was pulled down in 1846.

Fleet Street, a famous thoroughfare in London, now the centre of journalism and newspaperdom, though it was long celebrated for its taverns where the literary coteries of the day were wont to meet. It takes its name from the Fleet stream which used to run from Hampstead through Holborn to the Thames at Blackfriars.

Flemings, the people of Flanders, whose ancestors of mediæval times excelled in the textile arts; England owes its early eminence as a manufacturing nation to the migration of numbers of Flemings to this country in the 16th and 17th centuries.

Fleur de Lis, the former national emblem of France, the flower of the lily. It was superseded by the Tricolour in 1789, but is still adhered to by the supporters of the old French royalties.

Flint, a kind of silica of light grey colour and excessive hardness, which enabled it to be utilised in the formation of cutting implements in prehistoric times, and, before the invention of lucifer matches, was used along with steel for striking lights.

Flint Implements are objects found in the earlier geological strata, and constituting evidence of the condition and life of the period. They include knives, clubs, arrow-heads, scrapers, etc., used as weapons, tools and possibly as surgical instruments and in religious ceremonies. At the end of the Neolithic Period and the beginning of the Bronze Age a people using a new type of stone axe became evident in Europe, advancing towards the south and central regions, and supposed by many to be the ancestors of the present European stock, or Aryans. Similar to prehistoric specimens are the flint and obsidian implements of some of the primitive peoples of today. Ritual weapons and sacrificial knives continued to be made of stone long after the introduction of metals for practical purposes.

Flodden Field, Battle of (Northumberland), was fought on Sept. 9th, 1513, when England under the Earl of Surrey defeated Scotland under King James IV.

Florin, a coin first made in Florence in the 13th century. The name was afterwards given to an English gold coin of the value of 6s. issued in 1433. The English florin of to-day represents 2s., and dates from 1849.

Flounder, one of the most familiar of the smaller flat fishes common round the British coasts, and seldom attaining a weight of over three pounds.

Fluorine, a chemical element found in combination with calcium in fluorspar, and occurring in minute quantities in certain other minerals. Discovered by Scheele in 1771. It was first obtained by Moissan in 1886. A pale yellow gas, it is very reactive and combines with most elements except oxygen. Its acid, hydrogen fluoride, etches glass, the fluorine combining with the silicon to form volatile silicon fluoride.

Fluorescent Lamp. (*See* **Electric Light** and **Ultra-Violet Rays.**)

Fluorspar, a mineral; chemically, calcium fluoride. Can be colourless, green, or yellow, but is most commonly purple. Blue fluorspar under the name of Derbyshire "blue John" has been used for ornamental purposes.

Flute. A wooden musical instrument, part of the wood-wind of an orchestra, played by blowing across a mouth-hole, the notes being produced by pressing the fingers on finger-holes or keys. It has a compass of three octaves and a singular purity of tone. In simple form the flute has been known since Greek times, but the modern flute dates from the 18th century.

Fly, the popular name for a large number of insects with one pair of wings and a proboscis terminating in a sucker through which fluid substances can be drawn up. The best-known species are the common house-fly, the bluebottle, and the blow-fly. In the larval form flies are maggots, and feed upon decaying substances, animal flesh, etc. Flies are able to walk upon ceilings or upright surfaces by having suckers at the soles of their feet.

Flycatcher, name of a large family of small birds, the Muscicapidæ. They are insect feeders, catch their food in the air, and are distributed over most countries of the world. The spotted and the pied nest in Britain, which they visit from April to September.

Fly-drill, a kind of machine-tool having a reciprocating fly-wheel imparting steady momentum, the driving power consisting of a cord winding in reverse directions alternately upon a rotating spindle.

Flying Dutchman, a mythical mariner who, as the legend goes, was doomed as an expiation for his crimes to be for ever striving to reach harbour with his ship but never succeeding. Wagner constructed an opera round this weird subject.

Flying Fish are frequently to be seen in southern waters, and are capable of gliding considerable distances without touching the water. To build up speed for its "take-off" the fish swims rapidly, to break the surface at 15–20 miles an hour. Maximum air speed is about 40 miles an hour.

Flying Fox, an animal of the bat family, but of much larger size, and confined to the tropical and sub-tropical Old World. Like the bats, it is nocturnal, but it feeds entirely on fruits.

Flying Lemur, a remarkable genus of mammals, of which there are only two species, inhabiting Malaya and the Philippines respectively. They live on insects, fruit, and birds, and are provided with a parachute-like membrane which covers them from the neck to the tip of the tail, and is used in regulating their gliding.

Flying Lizard, a kind of Asiatic lizard, possessing wing-like projections from each side, which enable it to make flying leaps through the air, though not sufficient for continuous flight.

Flying Saucers, the name given to certain saucer-like shapes which have on occasion been seen travelling through the atmosphere. For some time speculation was rife, especially in America, but it has now been established that when not hallucinations, meteorological or cosmic-ray balloons, they are nothing more than atmospheric phenomena like mirages or mock suns caused by unusual atmospheric conditions. Described by Dr. Menzel, astrophysics professor at Harvard "as real as rainbows are real."

Flying Squirrel, rodents of which there are several species in Europe and America. It possesses a

parachute-like fold of skin by means of which it projects itself through the air. In appearance they are much like ordinary squirrels, to which they are related. The African flying squirrels belong to a different family.

Fog is caused by the presence of particles of condensed water vapour or smoke in the surface layers of the atmosphere, the term being applied meteorologically when the resulting obscurity is such as to render objects invisible at distances of up to 1 km. Fogs are frequently formed when the air near the ground is cooled below its dew-point temperature by radiation on a still, cloudless night; by flowing over a relatively cold land or water mass; or by mixing with a colder air stream. An accumulation of smoke over a large city may cause a high fog cutting off the daylight and producing gloom.

Foliation, a geological term applied to rocks whose component minerals are arranged in parallel layers as the result of strong metamorphic action.

Folio, a printing term for a sheet of paper folded once, a half sheet constituting a leaf.

Folklore concerns itself with the mental and spiritual life of the people—both civilised and primitive—as expressed in the traditional beliefs, customs, institutions, and sayings that have been handed down from generation to generation by word of mouth, and with the observation, recording, and interpretation of such traditions. (The word *folklore* itself was first suggested and used—as two words *Folk Lore*—by W. J. Thoms in the *Athenæum* of August 22nd, 1846, and was at once absorbed into the English language.) Traditional lore of the kind included in the term folklore takes many forms and ranges from omens of good and bad luck (spilling the salt, breaking a mirror, dropping an umbrella, etc.) and the wearing of amulets or the possession of talismans (such as the horseshoe) as protection against misfortune, to elaborate ceremonial dances such as the Abbots Bromley Horn Dance, the Hobby horses of Padstow and Minehead, the Northern sword-dances, and the Christmas mummers' plays. Especially important are the beliefs and customs associated with birth, babyhood, marriage, and death, such being occasions when the individuals concerned require special protection or when unusual happenings can be used for foretelling their future. The child born on a Sunday will be the luckiest; rocking an empty cradle will ensure the speedy arrival of a new baby; throwing an old shoe after a newly-married couple brings them luck; the bride should be carried over the threshold of the new home; on the sea-coast, death is believed to take place at the ebb-tide; the bees must be told of the death of the master of the house, or they will leave the hive. Another very large section of the subject deals with the traditional sayings and practices associated with particular days and seasons of the year—calendar customs, as they are called. The eating of pancakes on Shrove Tuesday; Mother Sunday customs and the simnel cake; Good Friday as the right day for planting potatoes, but emphatically the wrong day for washing clothes or cutting one's finger-nails; the necessity of wearing something new on Easter Sunday; the children's maypole dances and May garlands; midsummer fires; All Hallowe'en as the most favourable occasion for divining the future—especially in respect of marriage—and for games and sports such as apple-bobbing; the numerous practices accompanying the harvest. All these are examples of calendar customs; their full story would occupy several volumes. Folklorists are interested in all such oral tradition because they think that to a large extent it represents what folk have mentally stored up from the past and transmitted to their descendants throughout the centuries, and because therefore it is able to assist other historic methods—ethnographical, linguistic, archæological, etc.—in the elucidation of the early story of man. In those countries with a great diversity of peoples in all stages of culture, a knowledge of folklore and what it can teach of the mind of man is of great importance to administrators. The Folk-Lore Society was founded in 1878, and that part of the subject represented by song and dance has now its own organisation in the English Folk Dance and Song Society.

Force, as a term in physics, signifies an influence or exertion which, when made to act upon a body, tends to move it if at rest, or to affect or stop its progress if it be already in motion. The c.g.s. unit of force is the dyne; the practical unit 1 gram wt. = 980·616 dynes at sea-level Lat. 45°.

Formaldehyde. Chemically it lies between methyl alcohol and formic acid; oxidation of methyl alcohol yields formaldehyde, and oxidation of formaldehyde produces formic acid. It is used as a disinfectant, in silvering mirrors, and in the manufacture of phenol-formaldehyde plastics (of which bakelite is the best-known example).

Forme, a body of letterpress type, composed and secured for printing from; or a stereotype or electrotype. The former is used more for newspaper formes and the latter in good book work.

Formic Acid can be obtained from a colourless fluid secreted by ants and other insects and plants. It is a strong irritant. Commercially it is obtained from sodium formate, which is synthesised by the absorption of carbon monoxide in caustic soda. It is used in the electroplating, tanning, and textile industries.

Formula, in mathematics and physics a statement of certain facts in symbolical form.

Forte, a musical term signifying "loud," and represented by the letter "f"; "ff" (fortissimo) indicating "very loud."

Forth Bridge, which spans the Forth at Queen's Ferry, near Edinburgh, was completed in 1890 at a cost of £3 million. It is 5,330 ft. in length (with approaches 8,295 ft.). *See also* **Bridges.**

Forum, in ancient Rome, was a public meeting place and the centre of judicial and public business. It was also a market.

Fossils are the petrified remains of plants and animals and have been the means of disclosing a knowledge of prehistoric periods and of the history of the earth's life which would otherwise have been unknown. *See also* **F18.**

Foucault's Pendulum. This instrument, which demonstrates the rotation of the earth, was conceived by the French scientist Foucault in 1851. It is a pendulum consisting of a metal ball suspended at the end of a long wire. Its direction of swing in space remains constant, but owing to the earth's rotation it appears to change direction by 15° in an hour, and this amount represents the hourly angular rotation of the earth.

Four Freedoms, a phrase coined by President Roosevelt in January, 1941, embodying what should be the goal of the Allies. They were (1) Freedom of speech and expression; (2) Freedom of every person to worship God in his own way; (3) Freedom from want; (4) Freedom from fear.

Fox, a well-known carnivorous animal of the Vulpine family, found in considerable numbers in most parts of the world. The common fox of Europe is a burrowing animal of nocturnal habits, living upon birds, rabbits, and domestic poultry, in the capture of which it displays much cunning. The fox in Britain is preserved from extinction chiefly for hunting purposes. Among other notable species are the Arctic fox and the red fox of North America, of which the valuable silver fox, coveted for its fur, is a variety.

Fox-Shark, a large species of shark common in the Atlantic and in the Mediterranean. It is very destructive to small fish, but although it attains a length of 15 ft. it is not to be classed with the sharks that are dangerous to man.

Franciscans. (*See* **Friars.**)

Franco-German War (1870–71). It was opened by a declaration of war by Napoleon III., but the Germans who were better prepared than the French, won victory after victory. In September Napoleon and the whole French army were made prisoners at Sedan, a Republic was then proclaimed, and Paris sustained a four months' siege. In the end France ceded Alsace and part of Lorraine to Germany, who claimed a war indemnity of over £20 million.

Francolin, a genus of birds closely related to the common partridge, belonging to Africa and sometimes referred to as the spur-legged partridge. The common francolin ranges from Cyprus to Assam, where it is known as the black partridge.

Francs-Tireurs, an irregular body of French troops prominent in the Franco-German War. Also any organised corps of irregular troops who conform to the usages of war.

Frankincense is of two kinds, one being used as incense in certain religious services and obtained from olibanum, an Eastern shrub, the other is a resinous exudation derived from firs and pines, and largely used in pharmacy.

Franklin, the name given in feudal times to a country landowner who was independent of the territorial lord, and performed many of the minor functions of local government, such as serving as magistrate.

Freemasonry dates back to mediæval times, if not to a more remote period. It is a secret organisation, having lodges for social enjoyment and mutual assistance. The Grand Lodge of England was established in 1717; that of Ireland in 1730, and that of Scotland in 1736. Roman Catholics are prohibited by Papal ban from being masons.

Fresco, a painting executed upon plaster walls or ceilings, and much in favour for churches and public buildings in former times. The work is done with prepared pigments. *See also* **G38** (1).

Freshwater Shrimp, a small crustacean abounding in British streams, and feeding on dead fish or other decomposing matter. Although of shrimp-like form it is not closely related to salt-water shrimps. Its generic name is *Gammarus*.

Friars, members of certain mendicant orders of the Roman Catholic Church. The four chief orders are the Franciscans or Grey Friars, the Dominicans or Black Friars, the Carmelites or White Friars, and the Augustinians (Austin Friars).

Friday, the 6th day of the week, named after Frigga, the wife of Odin. It is the Mohammedan Sabbath, and is a general abstinence day of the Roman Catholic Church. According to popular superstition, Friday was an unlucky day.

Frigate, a small, swift war-vessel, generally with two decks, and carrying a number of guns, usually from 30 to 60. Now superseded by the armoured cruiser.

Frigate-Bird, a web-footed bird widely distributed over tropical latitudes, and deriving its name from its great expanse of wing and forked tail, which seem to suggest the shape of a swift vessel. It feeds on flying fish mostly, being unable to dive. A frigate-bird was found dying on the Hebridean island of Tiree in July 1953; only twice previously had one been recorded in Europe—the first on the German coast in 1792, and the second on the coast of France in 1902.

Fringillidæ, the scientific family name of a large class of passerine birds, including finches, red-polls, crossbills, grosbeaks, linnets, and buntings.

Fritillary, the name of a large class of British butterflies, all of them of beautiful colours and marking. There are seven species, the most prized of which is the "Queen of Spain" variety.

Frog, a familiar amphibian, breathing through gills in the earlier (tadpole) part of its existence, and through lungs later. It remains three months in the tadpole stage. The frog hibernates underwater in the mud during the winter.

Frost occurs when the temperature falls to, or below, 32° F., which is freezing point. Hoar frost is applied to the needles or feather-like crystals of ice deposited on the ground, in the same manner as dew. Glazed frost is the clear icy coating which may be formed as a result of rain falling on objects whose temperatures are below the freezing point. These layers of ice, often rendering roads impassable for traffic, damaging overhead power and communication systems and endangering aircraft, can also be caused by condensation from warm, damp winds coming into contact with very cold air and freezing surfaces.

Froth-Hopper *or* **Frog-Hopper.** A family of bugs (belonging to the insect order Hemiptera) which in the young stage surround themselves with a protective mass of froth. These insects, which suck the sap of plants, bear a faint resemblance to frogs, and the adults possess great leaping powers.

Fugue. A contrapuntal piece of music in which the several "voices" take up the theme in turn.

Fulani, a Mohammedan race inhabiting the Sudan, at one time possessing a kingdom in Nigeria, sometimes called the Sokoto Empire.

Fuller's Earth, a special kind of clay or marl possessing highly absorbent qualities, and used from ancient times in the "fulling"—that is, cleansing and felting—of cloth. It is common in certain parts of the south of England, and is valued as a skin emolient.

Fungi, a class of organism resembling plants, which reproduce from spores and lack the green colouring matter *chlorophyll*. They consequently have to get their food from organic substances, whether as parasites on living plants and animals or as saprophytes on dead matter. Fungi include moulds, rusts, mildews, smuts, mushrooms, etc. Penicillin was produced from a mould fungus. Potato blight is a fungus disease which caused the failure of the potato crop in Ireland in 1846. 50,000 different fungi are know. *See also* **F28** (2), **P8** (1).

Fusible-plug, a safety-plug placed in the skin of a steam-boiler, so as to be melted and allow of the discharge of the contents when a dangerously high temperature is attained.

Fustian, the name given at various times to different kinds of textile fabrics. Originally, fustian was made of linen and cotton; later, wool was used; but in recent times the name has been mainly applied to a twilled cotton material with a nap surface.

Fustic, a dyewood yielding various shades of yellow according to the mordants used. The wood of the Venetian sumach, *Rhus cotinus*, yields young fustic; old fustic comes from the wood of *Clastrastis tinctoria*, which grows in tropical America and the West Indies.

G

Gabardine, a long, loose, coarse, over-garment, worn by men of the common class in the Middle Ages, and prescribed by law as the distinctive garment of the Jews.

Gabbatha, the Hebrew term for that part of a judgment-hall which was occupied by the governor or supreme authority, and from which he pronounced sentence. Used in John xix. 13 to designate the place where Pilate sat at Christ's trial.

Gabbro, a kind of igneous rock, often very coarse-grained, containing a good deal of plagioclase felspar, and monoclinic pyroxene; it may occasionally also include biotite, magnetite, ilmenite, and hornblende. A gabbro containing nickel at Sudbury in Canada is one of the richest sources known of that metal.

Gaberlunzie, the name given to an old-time class of beggar in Scotland, who had licence to ply his "profession" within a prescribed district.

Gable, the triangular end of a building, rising above the cornice to its apex. The end wall of a sloping roofed house is called the gable-end; and a gable-window is a window situated in the gable or constructed in gable form.

Gadfly, a widely distributed family of flies with only one pair of wings (*Diptera*), possessing great power of flight. The females are very voracious, being able to bite through the skin and suck the blood of animals. The males are harmless.

Gadolinium. An element belonging to the rare-earths metals discovered in 1886 by Marignac.

Gaelic, relating to the Gaels and their language, a term now applied only to the Celtic people inhabiting the Highlands of Scotland, but formerly also to the Celts of Ireland and the Isle of Man.

Gaine, a sculptured figure, the upper part of which is in natural form and outline, and the lower part (except sometimes the feet) is some simple architectural feature seeming to envelop the body and legs. The gaine was often used in ancient Greek and Egyptian architecture.

Galago, a sort of lemur, native to Africa, large-eyed, in keeping with its nocturnal characteristics.

Galatians, St. Paul's Epistle to the, is supposed to have been written by the Apostle about A.D. 56. It was addressed to the Galatian Churches, and, in addition to supporting Paul's apostolic authority, advocated justification by faith.

Galaxy *or* **Milky Way** is the part of the heavens, in Milton's words, "powdered with stars." The term galaxy is also used as a name for our

stellar universe, the huge disk-shaped cloud of gas and stars that is turning in space like a great wheel, with a diameter of about 100,000 light years. The Milky Way is really only a small part of this disk, and every star in the galaxy is moving round the centre under the gravitational control of the whole. The sun and planets lie near the edge of the disk, and it takes them about 250 million years to travel once round. The number of stars that can be seen with the unaided eye is just over 2,000, and they all belong to our galaxy. With the large modern optical and radar telescopes many other systems, similar in size and weight to our galaxy, have been discovered, scattered more or less uniformly through space, and the universe is said to include at least 100 million such galaxies. *See also* **F3–6.**

Gale, a high wind now technically defined as one of at least Beaufort force 8. Between thirty and forty gales a year occur on the north and west coasts of the British Isles and only about half of this number in the south-east. At St. Ann's Head, Pembroke, the anemometer registered a gust of 113 m.p.h. on Jan. 18, 1945, which is a record for these islands. Gusts exceeding 70 m.p.h. are rarely experienced in London. Gale warnings are issued for specified areas by the Meteorological Office, the warnings taking the form of radio broadcasts and the hoisting of storm signals at certain points on the coast. *See* Beaufort Wind Scale, **N10.**

Gall, abnormal vegetable growths, usually the result of an egg-deposit on leaves or bark by certain small flies called Cecidomyiids. Two of the best-known galls of oak are oak-apples and bullet-galls. The latter are spherical in form and yield tannin, useful for tanning and other commercial purposes.

Galleon, the name given to the old three-decked Spanish treasure vessels employed in conveying the precious minerals from the American colonies to Spain. The term is often applied to any large, especially stately, sailing vessel.

Galley, an oar-propelled sea-boat used by the ancient Greeks and Romans for transport purposes, manned by slaves. Boats of a similar class were used by the French down to the middle of the 18th century, and manned by convicts.

Gallic Acid, obtained from gall nuts, sumach, tea, coffee, and the seeds of the mango, is used in the manufacture of inks and as an astringent in medicine. It was discovered by C. W. Scheele (1742–86), a Swedish chemist.

Gallium, a white metal related to aluminium, but which can be cut with a knife. It was discovered spectroscopically by L. de Boisbaudran in 1875. Long before Mendeleyev had predicted that an element with its properties would be found to fill the then existing gap in the Periodic Table; this gap came immediately below aluminium, so he suggested the name "eka aluminium" for it.

Gallup Poll, a system, introduced by Dr. Gallup of the United States, for testing public opinion on topical subjects by taking a test poll on questions framed to elicit opinions.

Galvanised Iron is iron coated with zinc. The name comes from the fact that such a coat protective against rust could be deposited electrolytically. Electrodeposition is sometimes used, but the cheaper and more common process depends on dipping the iron in a bath of molten zinc.

Gambeson, a protective garment of leather or padded material, reaching from the neck to the knees, worn by soldiers prior to the introduction of plate-armour, and also beneath the hauberk.

Gamboge, a resinous gum obtained from certain trees native to Siam, Indo-China, and Ceylon, and used as a yellow pigment in paints and also as a purgative.

Game is the term applied to wild animals which are protected from indiscriminate slaughter by Game Laws. In the United Kingdom game comprehends deer, hares, pheasants, partridges, grouse, black game, moor game, woodcocks, bustards, and certain other birds and animals of the chase. Game can only be killed (with few exceptions) by persons holding game licences, which cost £3 a year. Occupiers of land and one other person authorised by them in each case are allowed to kill hares and rabbits on their land without licence. Game cannot be sold except by a person holding a proper licence. There is a "close time" prescribed for the different classes of game; for instance, the selling or exposing for sale of any hare or leveret during March, April, May, June, or July is prohibited by law. Grouse cannot be shot between Dec. 11 and Aug. 11; patridges between Feb. 2 and Aug. 31; pheasants between Feb. 2 and Sept. 30; and black game between Dec. 11 and Aug. 10. In regard to foxes, stags, and otters, custom and not Parliament prescribes a certain law which sportsmen rigidly adhere to. Game reserves are legally protected areas where natural vegetation and wild life are allowed to remain unmolested by sportsmen or those who might destroy for economic ends. *See* British Game Seasons, **N20.**

Gaming *or* **Gambling**—*i.e.*, staking money on the chances of a game—differs from betting in that it depends upon the result of a trial of skill or a turn of chance. The Betting and Gaming Act of 1959 replaced all the old laws on gaming, which went back to an Act of 1541 entitled "An Acte for Mayntenance of Artyllarie and debarringe of unlauful games," under which some games were unlawful if played for money in any circumstances. Roulette and any game of dice were among such games. Under the new Act any game is lawful, subject to certain conditions.

Gamut. The set of lines and spaces on which music is written.

Ganga, the pin-tailed sand-grouse, a handsome bird mostly found in North-Western Africa.

Gangue. Useless minerals associated with metallic ores.

Gannet, a fish-eating bird which dives on its prey from a great height, swallowing it under water; is found in large numbers off the coast of Scotland, and has breeding stations in the Hebrides, St. Kilda, Ailsa Craig, the Bass Rock, Grassholme Island, and on Ortac and Les Etacs (rocks off Alderney). It is a bird of white plumage, black tips to long narrow wings and wedge-shaped tail, and weighs about 7 lb. The gannet breeds in colonies on ledges of steep, rocky, island cliffs. Related to the cormorants, pelicans, and frigate-birds.

Garden Cities in England were founded by Ebenezer Howard (1850–1928), and his ideas were put forward in his book *Tomorrow—A Peaceful Path to Real Reform* (later re-issued as *Garden Cities of Tomorrow*). New towns should be so placed and planned as to get the best of town and country life, an adaptation of the model villages of certain industrial philanthropists such as Salt, Richardson, Cadbury, Leverhulme, and others. The Garden City Association (later the Town and Country Planning Association) was formed in 1899, and the first garden city was begun at Letchworth in 1904 and successfully established. Welwyn Garden City was also Howard's foundation, established in 1919.

Gardener-Bird, a bird possessing many of the characteristics of the bower-bird, and found only in Papua–New Guinea. *See also* **Bower Bird.**

Gargantua, the giant hero of Rabelais' satire, of immense eating and drinking capacity, symbolical of an antagonistic ideal of the greed of the Church. *See* **G44** (1).

Gargoyle, a projecting spout for carrying off water from the roof gutter of a building. Gargoyles are only found in old structures, modern water-pipe systems having rendered them unnecessary. In Gothic architecture they were turned to architectural account and made to take all kinds of grotesque forms—grinning goblins, hideous monsters, dragons, and so forth.

Garial *or* **Gavial,** the crocodile of the Ganges, feeding chiefly on fish. It has a long snout, and its overall length may exceed 20 ft.

Garlic, a bulbous plant of the same genus as the onion and the leek, and a favourite condiment among the people of Southern Europe. It possesses a very strong odour and pungent taste and its culinary use is agelong.

Garnet, a group of minerals; chemically they are orthosilicates of the metals calcium, magnesium, titanium. Garnets can be coloured yellow, brown, black, green or red; the blood-red garnet is an important gemstone.

Garrotte, a method of strangulation used as capital punishment in Spain, and consisting of a collar which is compressed by a screw that causes death by piercing the spinal marrow. Garroting was also applied to a system of highway robbery common in England in 1862–63, the assailants seizing their victims from behind, and by a sudden compression of the windpipe disabling them until the robbery was completed.

Garter. The Most Noble Order of the Garter was founded (*c.* 1348) by King Edward III., and is the premier order of knighthood in Great Britain. The traditional story associating the garter and the motto with the Countess of Salisbury, who it was said dropped her garter while dancing with the King, who remarked "honi soit qui mal y pense" cannot be accepted. The order was originally limited to the Sovereign and 25 knights, but the number has been extended, and it may now be bestowed on royal personages and leading representatives of the British peerage. The insignia of the order are the garter of dark-blue velvet with the motto in letters of gold, the mantle of dark-blue velvet lined with white silk, the surcoat and hood, and the gold-and-enamel collar. The garter is worn on the left leg below the knee and by women as a sash over the left shoulder. (*See* **Knighthood.**)

Gas is an elastic fluid substance, the molecules of which are in constant motion, and exerting pressure. The technique whereby gases are liquefied depends on increasing pressure and diminishing temperature. Each gas has a critical point; unless the temperature is brought down to this point no amount of pressure will bring about liquefaction. Last gas to be liquefied was helium (1908) which boils at −209° C. *See* Gas Laws, **N30.**

Gas from Coal for lighting and heating purposes is obtained from bituminous coal. Such a gas was produced and used for illuminating purposes by William Murdoch towards the end of the 18th century in Birmingham, and about 1807 the illuminant was introduced in London, one side of Pall Mall being lighted with it. It soon supplanted oil and candles for outdoor and indoor lighting, and is still, in spite of the advances of electric light, a common illuminant, its power having been greatly increased by the incandescent burner. It is widely used for space heating and cooking. (*See* **Underground Gasification.**)

Gas Turbine. This kind of engine has recently become a competitor of the internal combustion engine. Mechanical movement is produced by a jet of gas impinging on a turbine wheel. Gas turbines are being used in aeroplanes, locomotives, and ships. These engines are mechanically simple compared with internal combustion engines, and require less maintenance. It has been stated that the jet-propelled Comet cruises at 450 m.p.h. burning less than ½ lb. of kerosene per passenger mile.

Gastropoda, a class of molluscs which includes all such as possess a univalve shell—snails, whelks, limpets, etc.

Gate House, a structure built over and flanking a gateway, and common in ancient times at the more important entrances of a city, castle, monastery, abbey, or college. The Gate House of Westminster, built in 1370, was used as a prison. This was demolished in 1776, but one of its walls remained until 1836.

Gauchos are South Americans of Spanish descent, and of a wild and fearless disposition. They are mostly employed in the management of cattle, and are noted for their skill in the saddle, and for their lasso throwing. Their numbers grow less from year to year, and as the Pampas comes more under modern European control their existence as a distinct class will gradually dwindle away.

Gauge, a standard dimension or measurement, applied in various branches of construction. Thus, the Standard Railway Gauge is 4 ft. 8 in. in the United Kingdom, United States of America, Canada, France, Germany, Austria, Holland, Egypt, Belgium, Denmark, Italy, Hungary, Sweden, Switzerland, and Turkey. In India, Ceylon, and Spain the gauge is 5 ft. 6 in. In Soviet Russia and Finland, 5 ft., Ireland, 5 ft. 3 in. Narrow railway gauges of different standards are in use on very steep inclines in various countries. Other standard gauges are fixed in building, gun-boring, and other operations.

Gauls were inhabitants of ancient Gaul, the country which comprised what is now France, Belgium, and parts of the Netherlands, Switzerland, and Germany.

Gault, a stratum of blue clay between the Lower Greensand and the Chalk. A typical section of the Gault can be seen at Folkestone.

Gauntlet, a glove of armour, worn in the 12th and 13th centuries as a sort of mitten, and attached to the sleeve of the hauberk. In the 14th century gauntlets were made of mail, and later of hammered steel with separated and jointed fingers.

Gavel, enough grain in the straw to form a sheaf, into which it is converted by binding.

Gavelkind, an old English custom of land tenure in Kent and other places in England, whereby on the death, intestate, of a property owner, his property is divided equally amongst his children and not according to the law of primogeniture. It was abolished by the Law of Property Act, 1922, and the Administration of Estates Act, 1925.

Gayal, a kind of wild ox about the size of an English bull. A native of Eastern India, and easily domesticated.

Gaydiang, a junk-like Annamese vessel, with two or three masts and triangular sails, carrying cargo from Cambodia to the Gulf of Tonkin.

Gazelle, an animal of the antelope family, of small and delicate shape, with large eyes and short cylindrical horns. It is of a fawn colour, a native of North Africa, and easily domesticated.

Gecko, the name of a family of lurid-hued lizards common in or near the tropics. They are of nocturnal habits and feed on insects, and though by some accounted venomous, they are harmless.

Geiger Counter. The instrument most commonly used for making radioactive measurements.

Geissler's Tubes, invented by Geissler, contain rarified gases (at about $\frac{1}{100}$ atmosphere pressure), and when an electric discharge passes through them the gases glow brightly.

Gelalæan Era, an era introduced by and named after Gelal-u-Din, Sultan of Khorassan, and commencing March 4, A.D. 1079.

Gelatine, a transparent, tasteless, organic substance obtained from animal membranes, bones, tendons, etc., by boiling in water. It is of various kinds, according to the substance used in making it. Isinglass, the purest form of it, is made from air-bladders and other membranes of fish, while the coarser kind—glue—is made from hoofs, skin, hides, etc. Its constituents are carbon, hydrogen, oxygen, and nitrogen. Gelatine is applied to an immense variety of purposes, from the making of food jellies to photographic materials.

Gemini, one of the signs of the Zodiac lying east of Taurus and containing numerous stars, only two of which—Castor, the upper and brighter one, and Pollux, the lower one—are visible to the naked eye. The stars are named after twin divinities of classical mythology.

Gemsbok, a large South African antelope, with long straight horns and tufted tail. Light fawn in colour, it has a black streak across its face, and is very fleet of foot.

Gender, a distinction made in grammar between words to indicate the sex or lack of sex of the objects denoted by these words. While there are but two sexes, there are in some languages, like English and German, three genders: masculine, feminine, and neuter. In English, as a rule, words denoting inanimate objects are neuter gender (exceptions: sun (masculine), ship, engine (feminine), etc.), while in German, inanimate objects, besides being neuter, may be masculine or feminine gender. In French the neuter gender does not exist.

Genealogy is the science of family descent, treating of ancestors and their descendants in various branches in the natural order of succession. Pedigrees of the principal families in Great Britain are recorded at Heralds' College.

General, a military title next in rank to that of Field-Marshal, the highest officer in the army. Ranking below full General are Lieutenant-General, Major-General, and Brigadier.

Generation, a time-measure reckoned at about 30 years when children are ready to replace parents; also the body of persons existing at the same time or period.

Generation, Spontaneous. (*See* **Abiogenesis.**)

Genesis, the first book of the Pentateuch, compiled in the 5th century B.C., which carries the scriptural narrative from the Creation to the death of Joseph. The stories of the Creation, Garden of Eden, the Fall, and the Flood were largely derived from Babylonian mythology; the conditions described around the figures of Abraham, Isaac, Jacob, and Joseph have a genuine historical basis.

Genet, one of the smaller carnivorous animals, about the size of a cat, but with longer tail and spotted body. It is a native of Southern Europe, North Africa, and Western Asia, and is valued for its fine soft fur, and also for a perfume it produces.

Genes, the units of heredity. *See* **F31, 58** (2).

Genetics, the science of heredity. *See* **F31.**

Geneva Convention, an agreement made by the European Powers at Geneva in 1864, establishing humane regulations regarding the treatment of the sick and wounded in war and the status of those who minister to them. All persons, hospitals, hospital ships are required to display the Geneva cross—a red cross on a white ground. A second conference held at Geneva in 1868 drew up a supplementary agreement. An important result of this Convention was the establishment of the Red Cross Society in 1870.

Genouillieres, ancient metal caps for covering the knees of an armed man; an example may be seen on the Black Prince's monument in Canterbury Cathedral.

Genre, an art term used to describe a style of painting which deals with subjects of homely life, but also applied in France in connection with other kinds of paintings as genre du paysage (landscape painting), genre historique (historical painting), etc.

Gentian, the name for plants of the *Gentiana* genus, many of which have intensely blue flowers. The gentian-root of *G. lutea* is used in pharmacy.

Gentile, a term used in the Scriptures to designate any person who is not a Jew.

Gentlemen-at-arms, a corps of army officers of distinction under a captain whose duty it is to attend the Sovereign on ceremonial occasions. The corps was formed by Henry VIII. in 1509 as personal bodyguard. They come under the direction of the Lord Chamberlain.

Genus, a term applied in biology to designate any kind, sort, or class of species.

Geodesy, the science of calculating the configuration and extent of the earth's surface, and determining exact geographical positions and directions, with variations of gravity, etc. Land-surveying is a branch of geodesy.

Geography, the science which describes the earth's surface, its physical peculiarities, and the distribution of the various animals and plants upon it. It is usual to divide the subject into two main branches—physical geography, which deals with the composition of the earth's surface and the distribution of its living occupants, animate and inanimate; and human geography, which includes economic, political, and social geography.

Geology, the science which deals with the condition and structure of the earth, and the evidence afforded of ancient forms of life. The geological strata are classified in the following categories: *Primary* or *Palæozoic* (the oldest rocks including the Cambrian, Ordovician, Silurian, Devonian, Carboniferous, Permian); *Secondary* or *Mesozoic* (Triassic, Jurassic, Cretaceous); *Tertiary* or *Cainozoic* (Eocene, Oligocene, Miocene, Pliocene, Pleistocene); *Post tertiary* (most recent rocks). *See* **F20.**

Geometrical Progression is a term used to indicate a succession of numbers which increase or decrease at an equal ratio—as 3, 9, 27; or 64, 16, 4.

Geometry is the branch of mathematics which demonstrates the properties of figures, and the distances of points of space from each other by means of deductions. It is a science of reason from fundamental axioms, and was perfected by Euclid about 300 B.C. The books of Euclid contain a full elucidation of the science, though supplemented in modern times by Descartes, Newton and Carnot. Of recent years non-Euclidean geometry has been developed.

Geophysics, the branches of physics which are concerned with the earth and its atmosphere. Meteorology, geomagnetism, aurora and airglow, ionosphere, solar activity, cosmic rays, glaciology, oceanography, seismology, nuclear radiation in the atmosphere, rockets, and satellites—all these are geophysical subjects. The object of the International Geophysical Year, 1957–58, was to investigate the physical phenomena occurring on and around the earth by means of carefully co-ordinated observations made simultaneously all over the globe. *See also* **F46.**

George-Noble, a gold coin, so called from St. George and the dragon depicted on its obverse. First issued in the reign of Henry VIII.

German Silver, an alloy of copper, zinc, and nickel, and used in the manufacture of table-ware, such as spoons, forks, etc.

Germanium. A silver-white hard brittle metallic element chemically related to silicon and tin. Discovered by Winkler in 1886. Its richest ore is germanite containing 6% of the metal. Coal is also a relatively rich source. *See also* **F66** (2).

Gesta Romanorum, a Latin collection of stories published in the Middle Ages, and of unknown origin. It was used by our earlier writers, who found many romantic incidents and legends which they were able to turn to good account. The collection circulated over Europe, and is believed to have been written by a monk, Pierre Bercheur, of the convent of St. Eloi, Paris.

Gestation, the carrying of young in animals during pregnancy, varies considerably in its length. In the case of an elephant, the period is 21 months; a camel, 12 months; a cow, 9 months; a cat, 8 weeks; a horse, 48 weeks; a dog, 9 weeks; and a pig, 16 weeks. Hens "sit" for 21 days; geese, 30; swans, 42; turkeys, 28; pigeons, 18.

Gethsemane, a secluded spot on the side of the Mount of Olives, half a mile from Jerusalem, said to be the scene of Christ's Agony in the Garden.

Geysers, hot springs of volcanic origination and action, are remarkable for the fact that they throw out huge streams of boiling water instead of lava as in the case of a volcano. The most famous geysers are those of Iceland, which number over a hundred, the principal one having an opening 70 ft. in diameter and discharging a column of water to a height of 200 ft. There are also geysers in the Yellowstone region of America, and some in New Zealand. Also a device now in common domestic use for heating running water quickly by gas or electricity.

Ghat, a river landing-place or stairway in India; a passage, or gateway. "Ghaut," another form of the word, means a mountain pass in the Mahratta tongue.

Ghee, a kind of butter, clarified by boiling, much used in the East Indies and made from coagulated milk. It will keep sweet for a long time when properly prepared.

Ghetto, the name given to the quarter in any city or town where Jews were formerly compelled to live, shut off by gates from the rest of the city. Not only were the quarters usually allocated badly situated, but the Jews had to pay a tax for the privilege of living there.

Ghost-Moth, an interesting nocturnal insect, (*Hepialus humuli*), common in England, possessing in the male a white collar and known for its habit of hovering with a pendulum-like action in the twilight over a particular spot where the female is concealed.

Giambeaux, metal armour for the legs and shins, worn by the warriors of Richard II.'s reign.

Gibbon, the name of a long-armed ape mainly inhabiting S.E. Asia. It is without tail, and possesses the power of very rapid movement among the trees of the forests.

Gilbertines were members of a religious order founded by St. Gilbert in the 12th century, which did not spread beyond England. The order included both men and women who lived in double houses which had no communication. The habit was black, covered with a white cloak.

Gin, a well-known spirit distilled from malt or barley and flavoured with the juniper berry. The principal varieties are the English and American, known as "Gin" or "Dry Gin", and the Dutch, referred to as "Geneva", "Schnapps" or "Hollands". The word "Gin" is an abbreviation of "Geneva", both being primarily derived from the French genièvre (juniper).

Ginger is obtained from a reed-like perennial plant grown in tropical countries. There are two varieties, black ginger and grey ginger. The former is obtained by peeling and drying the root, the latter by scalding and drying. Ginger is largely used as a condiment.

Giraffe, the tallest of existent animals, reaching a height of from 18 to 20 ft. when full grown. Its sloping back and elongated neck seem to be the natural evolution of an animal that has to feed on the branches of trees. It is a native of Africa, is of a light fawn colour marked with darker spots, and has a prehensile tongue.

Giralda, a beautiful and remarkable example of Arabian art, erected in 1195 at Seville, still in existence. Minarets similar to the Giralda are to be found at Morocco, Tunis, and Tetuan.

Girandole, a branching chandelier, or swing-armed candelabrum.

Girondins *or* **Girondists**, one of the prominent parties of the early period of the first French Revolution. They were moderate, and up to 1792 were a strong party. Their first leaders were from the department of Gironde, hence their name. With the Reign of Terror their influence came to an end, Robespierre and his party overthrew them, most of them being sent to the guillotine.

Girton College, founded at Hitchin in 1869, and removed to Cambridge in 1873, is one of the leading English university colleges for women.

Glaciers form in the higher Alpine ranges, and are immense consolidated masses of snow, which are gradually impelled by their force down the mountain-sides until they reach a point where the temperature causes them to melt, and they run off in streams. From such glaciers the five great rivers, the Rhine, the Po, the Rhône, the Inn, and the Adige, have their source. The longest of the Swiss glaciers is the Gross Aletsch, which sometimes extends over 10 miles. Some of the glaciers of the Himalayas are four times as long. The Muir in Alaska is of enormous magnitude, and that of Justeldals Brae in Norway is the largest in Europe.

Gladiators were professional athletes and combatants in ancient Rome, contesting with each other or with wild beasts. At first they were drawn from the slave and prisoner classes exclusively, but so much were the successful gladiators held in esteem that men came to make a profession of athletics, and gladiatorial training schools were established. When a gladiator was vanquished without being killed in combat, it was left with the spectators to decide his fate, death being voted by holding the hands out with the thumb turned inward, and life by putting forth the hands with the thumb extended. Gladiatorial shows were the chief public displays in Rome from the 3rd to the 4th centuries A.D.

Glasgow University, founded by Pope Nicholas V. in 1451, had a new charter granted to it in 1577 by James VI. of Scotland, and in 1858 and 1899 was remodelled by the Universities (Scotland) Acts.

Glass, a substance obtained from the fusion of silica (sand) with various bases, and is more or less transparent. There are numerous kinds of glass, but they group themselves under one or other of the following classifications:—Flint glass, or crystal, whose components are potash, silica, and oxide of lead; window glass, made from soda, lime, and silica; Bohemian glass, containing potash, lime, and silica; and bottle glass, composed of soda, lime, alumina, silica, and oxide of iron. Heat-proof glasses used for making cooking utensils contain boron. Glass was made by the Phœnicians, and was familiar in ancient Egypt. The Egyptians introduced it into Rome. In the Middle Ages Venice was famed for its glass manufactures, but after the 17th century Bohemia acquired pre-eminence. English glass reached its highest level of artistic design in the 17th and 18th centuries. Window glass was not used in this country for dwellings until the end of the Middle Ages.

Glass-Snake, a legless lizard, with a long, sinuous tail, which has the faculty of regrowth if broken off. Four species are known: in S.E. Europe, S.W. Asia, Indo-China, and N. America. Attains a length of about 2 ft., and its main colouring is green, with black and yellow markings.

Glauconite. A green mineral, chemically a hydrated silicate of potassium and iron. Commonly found in sands (hence these rocks are known as "greensands") and sandstones.

Glaucus is a curious genus of sea slugs (Nudibranchs) often called the Sea Lizard. It is without shell and has a soft body, with horny mouth and four tentacles. It is a native of the South Atlantic, and is not more than 1¼ in. in length.

Glee, an unaccompanied piece for three or more voices. Glee-singing was popular in England during the 18th and early 19th centuries and glee-clubs are still in existence.

Glencoe, Massacre of, occurred on Feb. 13, 1692. The victims were the Macdonald clan, who had failed to take the oath of allegiance to William III. The chief and thirty-seven of his clan were butchered at the instigation of Dalrymple. A clamour arose, William was forced to grant a commission of inquiry and, as a result, in 1695 Dalrymple resigned his office.

Globigerina, an oceanic unicellular animalcule with a perforated shell, and occurring in certain parts of the Atlantic in such vast numbers as to form a bed of chalk ooze with their empty shells.

Glockenspiel, an instrument composed of metal bars each of which is tuned to a note. The bars are struck by hand-hammers and give forth chiming sounds.

Gloria in Excelsis ("Glory to God in the highest") is the opening of the Latin hymn adapted from Luke ii. 4, and the most prominent hymn of the ecclesiastical rites in the Christian liturgies.

Gloria Patri, the lesser Doxology, with which chants are generally concluded in the English Church service—"Glory be to the Father, and to the Son."

Gloss, an explanatory statement or marginal note, often found in ancient manuscripts, and is sometimes more valuable than the text to which it refers.

Glove-Money, an extraordinary reward paid to officers of courts, and fees given to clerks of assize and judges' attendants by a County Sheriff when no offenders were left for execution; the white gloves presented to justices when there is a maiden session are a survival of this old legal usage.

Glow-Worm, a kind of beetle, possessing in the female the power of emitting a phosphorescent light underneath the extremity of the body. The male has the same power, but to a very limited extent, and has wings, while the female is wingless and looks like a larva throughout her life.

Glucinium *or* **Beryllium**, is a white metal prepared from beryl, and found also in the emerald and other rare minerals. Most of the salts of this metal have a sweet taste, hence the name.

Glucose, Dextrose *or* **Grape Sugar.** It is produced by hydrolysis from cane sugar, dextrine, starch, cellulose, etc., by the action of reagents. It also occurs in many plants, fruits, and honey. For brewing purposes glucose is prepared by the conversion of starch by sulphuric acid. Malt also converts starch into glucose.

Glutton *or* **Wolverine**, the biggest animal of the weasel order, inhabits the northernmost parts of Europe and America. In build it resembles the bear, and is rather larger than a badger. Its fur is of a brown-black hue, but coarse; the animal has great strength, and is remarkable for its voracity.

Glycerine *or* **Glycerol**, occurs in natural fats combined with fatty acids, and is obtained by decomposing those substances with alkalies or by superheated steam. It is colourless and oily and sweet, and is put to a variety of commercial uses, being widely utilised for medicaments, for lubricating purposes, and in the manufacture of nitro-glycerine.

Glyptodon, an extinct species of gigantic armadillo,

fossil remains of which have been discovered in S. America. It was some 9 ft. long, carried a huge tortoise-like shell, and had fluted teeth.

Gnat. (*See* **Mosquito.**)

Gneiss, a metamorphic rock containing quartz, felspar, and mica. It is banded, the light-coloured minerals being concentrated apart from the dark minerals.

Gnostics were an early Christian sect prominent from the 1st to the 6th centuries. They held that Christ was of divine origin, but they rejected the literal interpretation of the Scriptures; contending that God was unknown and beyond man's comprehension, and that knowledge rather than faith was the passport to Heaven.

Gnu, an animal of the antelope family, combining the characteristics of the buffalo in its head and horns, the ass in its neck and mane, and the horse in its long and bushy tail. There are two species, the common and the brindled, and they are about the size of an ass. They abound in Africa and congregate in herds.

Goat-Moth (*Cossus cossus*), a large moth of the *Cossidae* group, common in Britain, evil-smelling, and very destructive in the larval stage to trees of the poplar and willow genus, into the wood of which the caterpillar bores during its three years' period of development.

Goats are horned ruminant quadrupeds, indigenous to the Eastern Hemisphere, but now domesticated in all parts of the world. Though allied to the sheep, they are a much hardier and more active animal. The male has a tuft of hair under the chin. Many species, including those of Cashmere and Angora, are valuable for their hair, which is used for fine textile fabrics. The milk of the goat is nutritive and medicinal, and goat-skins are in good demand for leather for gloves, shoes, etc.

Gobelin Tapestry was originated by a family of dyers named Gobelin in the 15th century in Paris. The Gobelin establishment, which produced this beautiful tapestry, made of silk and wool, or silk and cotton, was taken over by the Government of Louis XIV., in 1662, and since then has been the French national factory for that class of fabric.

God is the term by which the idea of the one Supreme Being is expressed. The conceptions of God vary with different religions and different countries. Theism regards God as a personal being, and the author and ruler of the universe; Pantheism identifies God with the universe and not as a personal being.

Gog and Magog, two legendary City of London giants, supposed to be the offspring of certain wicked daughters of the Emperor Diocletian and a band of demons. They were brought captive to London and made to serve as prisoners at the Palace of Brute, which stood on the site of Guildhall. Effigies of the giants have stood in Guildhall since the time of Henry V. They were destroyed in the Great Fire of 1666, replaced in 1672, and used to be carried through the streets of London in the Lord Mayor's Show. The present figures, newly carved in lime wood by Mr. David Evans, replaced those carved in 1708 by Richard Saunders, which were destroyed in an air raid during the last war.

Gold. The greatest amount of gold is obtained by treating gold-bearing quartz by the cyanide process. The gold is dissolved out by cyanide solution, which is then run into long boxes filled with zinc shavings when the gold is precipitated as a black slime. This is melted with an oxidising agent which removes the zinc.

Gold-Beaters' Skin is the outside membrane of the large intestine of the ox, specially prepared and used by gold-beaters for placing between the leaves of gold while they beat them. This membrane is of great tenacity, and gets beaten to such extreme thinness that it is used to put on cuts and bruises.

Golden Age, according to the Greek and Roman poets, was the age of peace and innocence when mankind lived in a state of ideal prosperity and happiness.

Goldeneye (Garrot), a species of wild duck, widely distributed over Arctic regions. It is a passage-migrant and winter-visitor to the British Isles. Has nested in Cheshire. Distinguished by a large white spot in front of each eye on a dark ground.

Golden Legend, the title of a famous history of the Saints, compiled by Jacobus de Voragine, a Dominican monk, in the 13th century, translated and published by Caxton in 1483.

Golden Number, the number of any year in the metonic cycle of 19 years, deriving its name from the fact that in the old calendars it was always printed in gold. It is found by adding 1 to the number of the year A.D. and dividing by 19, the remainder being the Golden Number; or, if no remainder, the Golden Number is 19. The only use to which the Golden Number is put now is in making ecclesiastical calculations for determining movable feasts.

Golden Rose, the Pope's rose of wrought gold blessed and sent from time to time to the church or community his Holiness selects to honour.

Goldsmiths Company, one of the richest London City Companies; the official assayers of gold and silver, invested with the power of "hall-marking" the quality of objects made from these metals. First charter granted in 1327.

Gondola, the old regulation black boats so common on the canals of Venice, propelled by a gondolier with one oar who stands at the stern, his passengers being accommodated in a covered space in the centre.

Gonfalon, the pennon affixed to a lance, spear, or standard, consisting usually of two or three streamers, and made to turn like a weather-cock.

Gophers. Rodent mammals. The pocket gophers are stout-bodied burrowers common in the U.S.A. The slender burrowing gophers, also called "ground squirrels," occur in central and western U.S.A. The sisel or suslik is a related European species. They are a great pest among grain crops.

Gordon Riots of 1780 were an anti-popery agitation fomented by Lord George Gordon. Called also "No-Popery Riots."

Gorilla, the largest of the anthropoid apes, found in the forests of Equatorial Africa, and at maturity standing from 4 to 5 ft. high.

Goshawk (*Accipter gentilis*), a diurnal bird of prey, fearless and extremely agile; loves wooded country and is very destructive of poultry and game-birds. It resembles the peregrine falcon in appearance, but has shorter, rounded wings. This bird was a great favourite of falconers in mediaeval times. It is still a familiar sight in parts of Europe, was once common in England, where it is said to have bred again in recent years.

Gospels are those portions of the New Testament which deal with the life, death, resurrection, and teachings of Christ. They are the gospels of Matthew, Mark, Luke, and John, and the first three are called the *synoptic gospels* because of their general unity of narrative. That of John is of somewhat wider scope, and gives in addition to the story of the Passion an account of the ministry in Judea.

Goths. A Teutonic people who originally came from southern Sweden (Gotland) and by the 3rd cent. were settled in the region north of the Black Sea. They began to encroach on the Roman Empire and early in the 4th cent. split into two divisions: the Visigoths or West Goths, and the Ostrogoths or East Goths. The Ostrogoths were conquered by the Huns *c.* 370, while the Visigoths under Alaric devastated Greece and sacked Rome in 410. Eventually the Visigoths spread to France and Spain and their last king Roderick fell in battle against the Moors in 711. The Ostrogoths regained their independence on the death of Attila in 453 and under their king Theodoric the Great conquered Italy in 493. They lost their identity after Justinian regained Italy, 525–552.

Gourd Family *or* **Cucurbitaceæ.** This family of about 650 species of flowering plants includes the gourds, pumpkins, cantaloupes, cucumber, gherkin, water-melon. Most abundant in the tropics, the cucurbits are mainly climbing annuals with very rapid growth. The bathroom loofah is the skeleton of one cucurbit fruit, *Luffa cylindrica*. The squirting cucumber is another member of the family. (*See* **Ecballium.**)

Governor. A device attached to an engine, turbine, compressor, etc., which automatically controls the engine's speed in accordance with power demand. Most governors depend upon

the centrifugal action of two or more balls which are thrown outwards as their speed of rotation increases and actuate a throttle valve or cut-off. The centrifugal governor was invented by Thomas Mead, patented by him in 1787, and used on windmills. Watt adapted it to the steam engine.

Gowrie Conspiracy was an unsuccessful project for securing the person of, or assassinating, James VI. of Scotland, afterwards James I. of England.

Grail. (*See* **Holy Grail.**)

Gram *or* **Gramme,** the unit of weight in the metric system, defined as the 1000th part of a standard cylinder of platinum-iridium kept at Sèvres. Subdivision gives the centigram (100th part of 1 gram), milligram (1000th part) and so on. 1 ounce avoirdupois is equivalent to 28 grams approximately. (*See* **Metric System.**)

Grand Prix, the "French Derby," was established by Napoleon III., in 1863. It is the chief French race and is an international competition of three-year-olds.

Graphite *or* **Plumbago,** commonly called black-lead, is a form of carbon occurring in foliated masses in limestone, graphite, etc. It is soft, will make black marks on paper or other plain surfaces, and is mainly used for lead pencils. It is also a valuable lubricant. Pure graphite has found a new use with the construction of atomic piles. Important deposits occur in Siberia, Ceylon, Madagascar, Canada, and the U.S.A.

Grapnel, a modified kind of boat's anchor, with flukes for holding by. Also an arrangement of hooks or clamps for fixing to and holding one ship to another while being boarded in an engagement.

Graptolites, fossil animals which became extinct after the Silurian period. Structurally and in their way of life they were similar to the living hydrozoa; they grew attached to seaweed or the sea-bed. The specimens best preserved occur in shales.

Grasses *or* **Gramineæ.** This family of flowering plants, including about 4,000 species, is the most important economically. Ordinarily the farmer applies the term "grass" to the pasturage plants on which cattle, etc., feed, but botanically grasses take in the various cereal plants (wheat, barley, oats, rice, millet, etc.), and the bamboos.

Grasshopper. There are many species of these leaping insects which are related to the locusts. Most are vegetarians; a few eat flies and caterpillars also. The chirping sound they make comes by scraping the hind legs against the wings; in some species a noise is produced by rubbing the wings together.

Gravitation, the force of mutual attraction between massive bodies. Newton formulated the law of gravitation in these words: Any two particles of matter attract one another with a force directly proportional to the product of their masses and inversely proportional to the square of the distance between them. *See* **F14, 47** (1).

Gravity Railway is a railway worked by the power of gravity alone. The road is constructed on inclined planes, usually so arranged that descending cars pull the cars from below to the higher level.

Graylag, the ordinary wild grey goose of Europe, the species from which domestic geese are derived; frequents fens and marshes; breeds in decreasing numbers in Scotland; distinguished by pinkish legs and feet and lack of black markings on bill.

Grayling, a fresh-water fish of the salmon family having a large dorsal fin, and averaging about 1 lb. in weight. It affords good sport to the angler.

Great Circle Sailing is the art of steering a ship in a line with a straight diameter of the earth.

Grebe, a diving bird of beautiful plumage found over a great part of the world on lakes and oceans. The two species familiar in Great Britain are the Dabchick or Little Grebe and the large and handsome Great Crested Grebe, which has a feathery tuft on each side of the head. Grebes have remarkable courtship displays. The breast feathers are of a downy softness and silver lustre, for which they were formerly much hunted.

Greek Church represents the churches in accord with the Greek patriarchal see of Constantinople, and marks the point of separation from the Roman Catholic Church which occurred in A.D. 1054 when Pope Leo IX., excommunicated the patriarch, and the countries comprised in Greek, Greco-Roman, Russian, and certain Oriental groups remained faithful to the Patriarchal cause. The Greek Church accepts the doctrine of transubstantiation, believes in the intercession of the Virgin and saints, and the power of priestly absolution; but rejects purgatory, Papal supremacy, and allows its priests to marry. Greatly weakened after Russian Revolution and in Turkey after 1923.

Greek Fire, a combustible, supposed to have been composed of sulphur, nitre, naphtha, and asphalt, used with destructive effect by the Greeks of the Eastern Empire in their wars.

Greek Kalends, equivalent to never, as only the Romans, not the Greeks had kalends.

Green Room, the common assembling room for actors and actresses behind the stage, so called from the first room of the kind being decorated in green.

Gregorian Calendar, introduced by Pope Gregory XIII. in A.D. 1582 to replace the inexact Julian calendar. Great Britain did not adopt it until 1752 when eleven days were dropped in the month of September. *See* **Calendar.**

Gregorian Chant, ritual music with a system of harmony suitable for church use. First established by Pope Gregory I. *See* **G35** (2).

Grenadier was originally a picked soldier, employed in throwing hand grenades.

Gresham's Law states that if good money, *i.e.*, money with the higher intrinsic value, and bad money are in circulation together, the bad money will tend to drive out the good money from circulation. For instance, the good money is more likely to be melted down or demanded in payment by foreign creditors.

Gretna Green, a celebrated village in Dumfries, just over the border from England, where runaway marriages were performed from 1754 to 1856, though only completely stopped during present century.

Greyhound, one of the oldest known varieties of dog, bred for the chase, and of great fleetness. Used in the popular sport of coursing and for dog-racing. Among its sub-varieties are the Scotch deerhound, the Irish boar-hound, and the Russian wolf-hound.

Griffe, the name given to a claw-like architectural decoration common in mediæval buildings, and placed at the base of columns.

Griffin, in ancient mythology, a winged creature with an eagle's head and body of a lion, found in ancient sculptures of Persia and Assyria. Its origin is traced to the Hittites. It had the same religious significance as the winged sphinx of Egypt. The griffin vulture is a bird named after the mythological creature, found in Europe, Africa and India.

Grille, a metal-work covering in the form of decorative bars, used to protect apertures in walls or doors.

Grilse, a young salmon, at that period of its development when the fish makes its first return to fresh water, usually in its second year.

Grimm's Law, formulated by Jacob Grimm, an eminent German philologist, lays down a principle of consonantal change in the Germanic languages. For instance, Lat. *pater*, Engl. *father*, Ger. *Vater*, Lat. *frater*, Eng. *brother*, Ger. *Bruder*; Lat. *decem*, Eng. *ten*, Ger. *zehn*.

Groat, an old English silver coin of the value of 4*d*. It was first issued in the reign of Edward III., but after 1662 only coined as Maundy money. The fourpenny piece was resumed, though not under the old name, in 1836, but in recent years has dropped out of the coinage.

Groats (*or* **Grits**) are the grain of oats deprived of the husks; and, crushed, become whole meal.

Grog, the beverage served out to sailors, and compounded of spirit and water in prescribed proportions. The name, it is said, was derived from the fact that Admiral Vernon, who introduced it into the English navy in 1745, wore Grogram breeches.

Grogram, a kind of rough fabric made of wool and some other fibre, such a silk, mohair, or cotton, formerly much used for commoner kinds of wearing apparel.

Groschen, a silver coin introduced into the German

currency about the 14th century but not now in use. It was a thirtieth of a thaler, or about 1⅛ of a penny, English.

Grotto, a natural or artificial cave. Some grottoes are of great beauty, and are much frequented. Among the most famous are the Blue Grotto of Capri and the stalactite grotto of Antiparos. The latter has been known since 1673 and is of singular picturesqueness.

Ground Wave, that part of the energy emitted by a radio transmitter which travels along the ground; as opposed to the sky wave which is reflected back to earth by the ionosphere. With the lower radio-frequencies, the ground wave can be picked up over several thousand miles; in the broadcasting band, over a hundred or so miles; it is virtually useless at high frequencies. *See also* **X3**.

Grouse, game bird of the northern latitudes where some 20 species occur. They are stout, compact, ground-dwelling birds, protectively plumaged (the willow grouse turns white in winter), the male usually being larger and more brightly coloured than the female. The red grouse of the British moorlands has been introduced into Belgium and W. Germany. Of the same family are the blackcock, ptarmigan, capercaillie, American prairie-hen, and the common partridge. Grouse shooting begins in Britain on Aug. 12.

Gruyère, a special kind of cheese, first peculiar to the small town of that name in the canton of Freiburg, Switzerland, but now made in other parts of Switzerland and in France. It contains gas-filled cavities which give it a honeycombed appearance.

Guanaco, a large species of llama, common to South America, and utilised as a beast of burden.

Guano, the excrement of sea-birds, found in large quantities on the rocky islands of the western coasts of South America and Nauru Is. It forms a useful fertilising agent, being rich in phosphate and ammonia, and first came into use in 1841, since which time Peruvian guano has been a recognised article of commerce. Beds of guano of from 50 to 60 ft. in thickness are not uncommon. Fish guano and bat guano from caves in South America and the Bahamas are also used as fertilisers.

Gudgeon, a small fresh-water fish of the carp family.

Guelph and Ghibelline, italianised forms of the German words "Welf" and "Waiblingen," the names of two rival princely families whose conflicts made much of the history of Germany and Italy during the Middle Ages. The feuds between these two factions continued in Italy during the campaigns of Emperor Frederick I., and later developed into the fierce struggles of the 13th century between Emperor and Pope. In Italy the Ghibellines supported the side of the German emperors and the Guelphs the cause of the Pope. The present Royal Family of England is descended from the Guelphs, through the ducal House of Brunswick (the name of Windsor was assumed during the first world war).

Guildhall, the place of assembly of the members of a guild, and at one time, when guilds were in full strength, was practically the Town Hall. The London Guildhall is to-day the hall of meeting for the City of London Corporation.

Guilds for the fostering and protection of various trades have existed in England since Anglo-Saxon times, and from the 12th to the 16th centuries exercised great influence and enjoyed many privileges. There were trades' guilds and craftsmen's guilds, and in all large cities and towns there was a guild hall. Their successes in the Middle Ages led to many monopolistic abuses, and in the end it became necessary to free the country from their restrictive power. Seventy-nine guilds, including the Mercers, Grocers, Drapers, still exist and enjoy considerable revenues, but they are now only private bodies and have little direct influence upon the course of trade.

Guillemot, a genus of sea-birds of the auk family, common in Northern Europe, two species—the Common Guillemot and the Black Guillemot—being natives of our own sea coasts, nesting on the cliffs. Brünnich's Guillemot, an Arctic species, is a rare straggler in the British Isles.

Guillotine, the apparatus used in France for the execution of the death penalty. It consists of an oblique-edged knife, fixed between two grooved posts, which is heavily weighted and falls forcibly on the neck of the victim, severing head from body. A French physician, J. I. Guillotin, proposed in the Constituent Assembly of 1789 that it should be used instead of an axe or sword. It was invented by Dr. Antoine Louis, and was called at first "Louison" or "Louisette."

Guinea, an English gold coin of the value of twenty-one shillings, current from 1663 to 1817, and deriving its name from the first guinea coinage having been struck from gold obtained on the coast of Guinea.

Guinea-Pig, a rodent of the cavy family about 10 in. in length and with a tail so short that it does not project outside the body. It makes an excellent pet, though easily frightened. Its ancestors were species of the wild cavy of S. America said to have been domesticated by the Incas of Peru.

Guinea Worm, a large roundworm (nematode) which is parasitic in man. Occurs in tropical Asia and Africa.

Guitar, a six-stringed instrument with a hollow resonant body, the strings being plucked by the fingers. The instrument seems to have originated in Spain, but there is a variant known at the Hawaiian Guitar. A recent development is the Electric Guitar, in which the mechanical vibrations of the strings are converted into electromagnetic vibrations, amplified, and reproduced by a loud-speaker.

Gulden, a former gold coin of Germany, the Low Countries, and a former silver coin of Austria, worth about 1*s*. 8*d*. English. The silver gulden is still current in Holland.

Gules, a heraldic term, denoting a rose of red tincture, indicated by vertical lines drawn or engraved without colour.

Gulf Stream is confined entirely to the western side of the N. Atlantic and is the warm-water current flowing through the Straits of Florida from the Gulf of Mexico parallel to the American coast up as far as Cape Hatteras. From there it continues north-eastwards as a slower, broader, cooler (yet even so, relatively warm) drift of water, merging with the North Atlantic Drift and losing its identity about 40° N. Lat., 60° W. Long. It is a common error to attribute the warmth of the British Isles and Western Europe generally to the Gulf Stream but this has no influence whatever except in so far as it feeds the North Atlantic Drift. Both the Gulf Stream and the North Atlantic Drift owe their movement to the direction of the prevailing winds, and it is the south-westerly airstream coming from warmer regions and passing over the surface waters of the Atlantic Drift that brings the warmth inland to influence the climate of Western Europe.

Gull. An extremely well-known, long-winged sea-bird with rather short legs and webbed feet. In almost all adults the body and tail are white whilst the back and most of the wings are grey or black. In the majority of cases the plumage of juveniles is partly or entirely dusky. Gulls are omnivorous, and are very useful as scavengers. They follow ships and quickly seize upon any refuse which may be thrown overboard. There are 44 species, which vary in size from moderately small to large. With certain exceptions, such as the Kittiwake in the North Atlantic, they are not found very far from land. They are sociable and mostly breed in colonies on cliff-ledges, on islands, beaches and sandhills, and among vegetation in swamps, sometimes a long way from the sea. The nest is usually substantial, and the eggs generally number from two to three. Of the 29 species breeding in the northern hemisphere, 14 occur in the British Isles. The pure white Ivory Gull is the most northerly of birds. Sabine's and the Swallow-tailed Gull have forked tails. Ross's Gull has a black ring round the neck and one species, Franklin's Gull, migrates from the North, where it breeds, to pass the winter in the Southern hemisphere.

Gulliver, the hero of Swift's satire, *Gulliver's Travels*, who, in Lilliput and Brobdingnag, passed through a series of adventures which

were so contrived as to reflect the humour, follies, and shortcomings of Swift's day. Apart from its satire, it forms one of the best books ever written.

Gums are glutinous compounds obtained from vegetable sources, soluble in cold or hot water, but not in alcohol. There are innumerable varieties. Gum Arabic is exuded from a species of acacia grown in Senegal, the Sudan, Arabia, India and other countries, and is a valuable commercial product, used in dyeing, ink-making, as a mucilage, and in medicine. India-rubber is an elastic gum. Gums are also made from starch, potatoes, wheat, etc., from seeds, bark, roots, and weeds. Many so-called gums are resins.

Gun-Cotton, a powerful explosive manufactured by subjecting a prepared cotton to the prolonged action of a mixture of three parts sulphuric acid and one part of nitric acid. It burns without explosion on ignition, but by percussion explodes with a force five times greater than that of gunpowder.

Gun-Money, the name given to debased coins issued by James II. in Ireland in 1689 and made partly of metal from old cannon.

Gunny, a coarse cloth made in India from jute and hemp, used chiefly for bags and sacking, though sometimes also for clothing by the very poor. Gunny cloth is largely manufactured in Dundee.

Gunpowder, also called "black powder," the oldest of explosive mixtures, consists of saltpetre, sulphur, and charcoal, intimately mixed, the proportions being varied for different intended uses.

Gunpowder Plot was a conspiracy by a desperate band of Roman Catholics in the reign of James I. to avenge the harsh treatment to which Catholics were subjected. Barrels of gunpowder were secreted in the vaults underneath the Houses of Parliament, and it was proposed to fire these when the King and his Ministers assembled on Nov. 5, 1605. The plot was betrayed and Guy Fawkes and his co-conspirators were arrested and executed. The date serves to perpetuate the ancient custom of burning the effigy of Fawkes, a custom in which young people are the most enthusiastic participants, with bonfires, fireworks, etc.

Gunter's Chain, a surveyor's chain, 22 yd. long divided into 100 links, invented by Edmund Gunter (1581–1626), Professor of Astronomy at Gresham College, for the measurement of areas. 1 acre contains 100,000 square links.

Gurnard, a sea-fish, with large, bony head and diminutive body, of which there are some forty species. They are plentiful in British waters.

Guy's Hospital, founded by Thomas Guy in Southwark, London, in 1725.

Gybing, in navigation, means the moving of any boom-sail from one side of a mast to the other.

Gymnasium, originally the name given in ancient Greece to the public places where Greek youth used to exercise and receive instruction. Plato, Aristotle, and other great teachers lectured there. The Greek institution was never very popular with the Romans, and it was not until the 18th and 19th centuries that the cult of combining physical with intellectual activity again found a place in educational systems. In Germany the name was applied to the classical grammar school; in this country and America to the halls where gymnastics were practised.

Gymnosperms. In the pine and related plants the seeds are exposed and not contained in an ovary; because of the nakedness of the seeds, these plants are called gymnosperms. The gymnosperms, the most primitive of seed-bearing plants, include the Cycads, Ginko (maiden-hair tree), Conifers, and the Gnetales. Fossil gymnosperms were abundant by Carboniferous times. *See* **F29** (2).

Gypsies, a nomadic race, believed to be of Indian origin; their language, Romany, certainly seems related to Hindustani. They are spread over many parts of the world, but are most common in Europe, having appeared in Western Europe in 1417, finding their way to England at the beginning of the 16th century. They give evidence of their Eastern origin in their dark skins, large black eyes, black hair, and pearly white teeth. They are born wanderers, and pass from place to place following certain small occupations such as tinkering, basket-making, and the like.

Gypsum, a whitish mineral consisting of hydrated sulphate of calcium. The finest gypsum is alabaster. When heated gypsum is converted into the powder called Plaster of Paris; the water it loses can be taken up when the plaster is wetted, and the reconversion of Plaster of Paris into gypsum accounts for the way in which the former sets hard. The name "Plaster of Paris" came from the location of important gypsum quarries in the Montmartre district of Paris. It was found after the flood disasters of Jan. 1953 that gypsum could undo the effect of sea-water. By spreading it for the rain to wash into the soil, thousands of acres of farmland in Holland and Britain were made productive again.

Gyromancy, divination by walking in circles, was one of the ancient superstitions. The person for whose benefit the art was invoked walked round and round in a circle (about which certain signs had previously been placed) until he fell from giddiness. From the manner of his fall in relation to the signs, the interpretation was formulated.

Gyroscope, an application of the principle of the spinning top to a single-rail railway, the steering of ships, and the steadying of torpedoes. A high-accuracy gyroscope combined with a highly sensitive accelerometer in what is known as an inertial navigation system was used by the *Nautilus* when it made its journey under the North Pole in 1958.

H

Habeas Corpus, the name given to a writ ordering the body of a person under restraint or imprisonment to be brought into court for full inquiry into the legality of the restraint to be made. The first Habeas Corpus Act was passed in 1679, though nominally such a right had existed from Magna Carta, but some of the more despotic kings had disregarded it. In times of public peril the privilege of *habeas corpus* is sometimes temporarily suspended, many instances occurring in the history of Ireland and during the First and Second World Wars.

Haber Process, the important industrial process for synthesising ammonia from atmospheric nitrogen. Nitrogen and hydrogen are made to combine at high pressure (200 atmospheres or upwards).

Habrocoma, a genus of South American rodents, possessing four toes to each fore-foot, having large ears, and a fine, soft chinchilla-like fur.

Hackling-Machine, an apparatus employed in removing burrs and other foreign substances from raw flax prior to spinning. It consists of a pair of rollers covered with brushes and hackles.

Haddock, one of the best-known fishes abounding in northern seas and averaging about 4 lb. in weight. Largely used for curing, and sold as "finnan haddies."

Hade of veins, a mining term indicating the particular inclination that any vein, seam, or strata may have from the perpendicular; thus, in Weardale the veins mainly "**hade**" to the north.

Hadrian's Wall. (*See* **Roman Walls.**)

Hæmatite, peroxide of iron, one of the principal iron ores, containing about 70% of the metal. It is usually found in kidney-shaped masses, and is specular, red or brown, in thin fragments, but greyish in bulk.

Hæmocyanin, the respiratory pigment of crustaceans and molluscs. It functions like hæmoglobin, from which it differs in containing copper instead of iron and being blue when oxidised instead of red.

Hæmoglobin, the pigment containing iron which gives red blood corpuscles their colour. It is a respiratory pigment, having the property of picking up oxygen when the blood passes through the lungs to produce the compound known as oxyhæmoglobin. In other parts of the body the oxyhæmoglobin breaks down, liberating oxygen, which is used in the oxidation process (respiration) that the body tissues carry on.

Hafiz, besides being the pseudonym of a famous

Persian poet, is a title conferred upon any Mohammedan who has committed the whole of the Koran to memory.

Hafnium, a metallic element discovered by Coster and Hevesy in 1922 and important in the atomic-energy field. It occurs in most zirconium minerals to the extent of about 5 per cent.

Hag-fish, a parasite sea-fish with soft backbone and eel-like form; found within the bodies of other fish, and called sometimes the "borer," or "the glutinous hag-fish."

Hagiarchy, the rule or order of Saints.

Hagiology, a branch of literature that is wholly given up to the history of the saints, and the setting forth of the stories and legends associated with their names.

Hail, hard, roughly spherical, balls of ice, consisting of white cores covered by layers of both transparent and opaque ice, frequently falling during thunderstorms. They usually do not exceed 1 in. in size, but hailstones larger than apples and weighing more than 2 lb. have been observed. The general theory of a hailstone is that near the top of a cumulonimbus cloud a raindrop becomes frozen, grows in size by condensation and through collisions with snow particles, and eventually becomes so weighty as to overcome the ascending air currents in the cloud. Falling, it first encounters supercooled water drops, immediately freezing on it, increasing the white core, and then at lower levels ordinary water drops, freezing more slowly, producing a layer of clear ice. Before the hailstone arrives at the ground gusts and lulls may transport it several times up and down both regions, adding alternate coatings of soft white and hard clear ice.

Haileybury College, in Hertfordshire, originally established in 1809 for the education of boys for service under the East India Company. Since 1862 it has been a public school, receiving its charter in 1864.

Hake, a fish of the cod family, found in large numbers in the seas of Europe, but not in high favour for the table with fastidious feeders.

Halberd, a kind of spear much used as a military weapon in feudal times. Its blade was sharp-edged, and it bore an axe or projecting knife a few inches from the point. Halberdiers often formed the bodyguard of kings and notables.

Halcyon, a term associated in olden times with the kingfisher and days of soothing calm, "halcyon days" being a frequently used expression. The legend was that the kingfisher laid its eggs on the surface of the sea at the time of the winter solstice when the sea was specially calm.

Halibut, one of the largest of the flat fishes, averaging when full grown from 4 to 6 ft. in length, and highly esteemed for the table. Specimens of still larger size occasionally occur. It is plentifully distributed. Its two eyes are on the right side of the head.

Hall-mark. A mark or group of marks, impressed by an assay office on gold or silver articles guaranteeing the standard of fineness of the precious metal used in them. These marks, which have been applied to silver made in London since the beginning of the 14th century and perhaps earlier, make it possible to establish the year and place of assay as also the name of the maker. English pieces of silver usually have not less than four marks, viz., (1) town mark; (2) maker's mark; (3) date letter; (4) sterling mark.

The town mark is rarely changed; in London a crowned leopard's head was used from the earliest days until 1820 with only minor modifications, except for the period 1697–1720 when a lion's head erased was substituted; since 1820 the crown has been omitted.

Until the late 17th century a symbol was often used as a maker's mark, from 1696 to 1720 the first two letters of the maker's surname, and subsequently the maker's initials. Owing to the destruction of the earlier mark plates at Goldsmiths' Hall no maker's name prior to the late 17th century can be identified with certainty.

The London date letter is changed at the end of May each year, so each letter covers seven months of one year and five months of the following. The London date cycle has usually consisted of twenty letters: the alphabet of each cycle is of different style, and the letters are enclosed in shields of different shape.

The sterling mark, the lion passant, was introduced in 1544 and continued in use until 1697, when the higher Britannia standard was introduced in order to discourage the practice current amongst goldsmiths of melting down coin of the realm to make plate. The leopard's head crowned and the lion passant were then replaced by a figure of Britannia and a lion's head erased. Though the regulation imposing the higher standard was withdrawn in 1720, a small amount of Britannia standard silver continued to be made and still is made.

From 1784 until 1890 a plate tax was levied on all silver assayed in Great Britain and an additional duty mark, the sovereign's head, was used during this period. A Jubilee mark bearing the head of George V and of Queen Mary was used in between the years 1933 and 1935, and in 1953 a coronation mark with the head of Queen Elizabeth was introduced.

The tables of hall-marks in Gen. Comp. give the London date letter cycles from 1598 to the present day. The form of town mark and sterling mark used during each cycle is given at the head of each column. Where a major alteration took place in either of these marks during a date-letter cycle, the alternative forms are also shown. The date of the change can be established by reference to the notes above. At the bottom of each page the marks used by the major provincial, Scottish and Irish assay offices are shown. Owing to lack of space, the complete date-letter cycles are not shown, but two examples only from the 17th, 18th or 19th centuries. Where a provincial assay office was established in the 17th century or earlier, the marks of one year in the 17th and 18th centuries respectively are shown, where the office was not established until the 18th century, the marks of one year in the 18th and 19th centuries are given.

Halloween (Oct. 31), the eve of All Saints' Day, a time associated, especially in Scotland, with certain pleasing superstitions attractively set forth in Burns's famous poem "Hallowe'en." It is the night when young men and maidens are supposed, by observing certain rites, to have their future wives and husbands disclosed to them.

Halo, a luminous circle usually of 22° radius, surrounding sun or moon, produced by the refraction and reflection of light by ice crystals of high cirrus cloud. It is a very common occurrence, in the British Isles almost one day in three. The inner side is red and the outer a whitish-yellow colour. "Mock suns," *i.e.*, patches of light at the same elevation as the sun are much rarer occurrences, sometimes being of great beauty and brilliance. (*See* **Coronæ**.)

Halogens, the group name for the four non-metallic elements, chlorine, bromine, iodine, and fluorine. The term "halogen" means "salt-producer."

Halteres, the vestigial rear-wings of the two-winged flies or *Diptera* (*e.g.*, the house-fly). The equilibrium in flight of these insects depends on the halteres, which are commonly called "balancers."

Hampton Court Conference, presided over at Hampton Court Palace by James I. in 1604 and which brought about his authorised translation of the Bible, had an important bearing on the religious differences of the time. James refused to grant tolerations to the Puritans. This sowed the seeds of civil war. Following the conference three hundred English Puritan clergy were ejected from their livings.

Hanaper Office, a former Chancery office, deriving its name from the fact that its writs and papers were kept in a hanaper (hamper). The Chancellor's officer thus came to be known as the Hanaper. The Comptrollers of the Hanaper were abolished in England in 1842.

Hand, a measure of four inches, the average size of the palm; used in reckoning height of horses.

Handfasting, an informal marriage custom once prevalent in Scotland, whereby a man and woman bound themselves to cohabit for a year and a day, and at the end of that period either confirmed their contract by a regular marriage or separated.

Handspike, a wooden bar shod with iron to raise weights, used on shipboard and by artillery.

Hansard, the title given to the official reports of Parliamentary debates, so named after Luke Hansard who in 1774 became partner in a firm of printers to the House of Commons. His son T. C. Hansard was first the printer and then the publisher of an unofficial series of parliamentary debates inaugurated by William Cobbett in 1803. In 1909 production was taken over by H.M. Stationery Office and today's volumes contain full substantially verbatim reports of what is said in both Houses of Parliament.

Hanseatic League was a confederation of North German towns established about 1241 for purposes of mutual protection in carrying on international commerce. The League became so powerful that it was able to dominate the foreign trade of Norway, Sweden, Denmark, and even to some extent of London. A branch was established in London and had its guild hall in Cannon Street for hundreds of years. The League existed down to the middle of the 17th century. Hamburg, Lübeck, and Bremen are to-day the only cities which, as free ports, still by commercial courtesy retain the name of Hanse towns.

Hansom, a two-wheeled one-horse cab, invented by Joseph A. Hansom in 1843. It was, until the introduction of the motor-cab (or "Taxi"), the cab in most ordinary use in London and many other cities and towns in the United Kingdom. Lord Beaconsfield styled it the "gondola of London." It is constructed to seat two persons, and the driver sits on a "dickey" behind, level with the roof of the cab.

Hara-kiri, the custom of suicide by compulsion, or "happy despatch," once common in Japan, but no longer permitted. The condemned person gave himself the first cut, and if his courage then failed him, the fatal blow was dealt by a friend.

Hare, the leading member of the Lepus genus, and common in Northern Europe. Noted for having four upper front teeth, one pair behind the other, long ears, short tufted tail, and a cleft upper lip. It is a very swift animal, and intelligent in eluding pursuit, therefore much hunted, greyhounds being used to chase it, the sport being called "coursing." The hare makes a nest of grass, called a "form." It is prohibited by law to sell a hare or leveret during March, April, May, June, and July.

Harleian MSS. comprise some thousands of volumes of MSS. and documents, collected by the first Earl of Oxford (1661–1724) and his son Edward. After the death of the latter, his widow handed the MSS. over to the nation for £10,000, a sum that did not represent a quarter of their value, and they are deposited in the British Museum.

Harlequin, the buffoon of ancient Italian comedy. As adapted to the British stage, however, harlequin is a pantomime character only, in love with Columbine, appearing in parti-coloured garments and carrying a wand, by which he exercises a magic influence in thwarting the fantastic tricks of the clown and pantaloon.

Harmattan, a dry wind which may blow between January and May across the Sahara to the Gulf of Guinea. Although affording relief from the tropical heat, vegetation withers because of its extreme dryness and much irritation is caused by the clouds of fine dust which it carries.

Harmonic Motion, regular periodic motion of the kind exemplified by a ball bobbing up and down at the end of a spring, and by the piston in a steam engine. It may be simple (simple harmonic motion) or composed of two or more simple harmonic motions. In simple harmonic motion the acceleration is proportional to the distance of the moving body from its original rest position.

Harmonics. Flute-like tones which can be produced by touching the strings of a violin in a certain way. The effect is due to the suppression of the fundamental frequency at which the string would normally vibrate. In consequence only the harmonics or overtones (notes one octave or more above the fundamental which combine to give the characteristic timbre of the instrument) are heard.

Harmonica *or* **Mouth Organ,** a small instrument consisting of reeds enclosed in separate chambers through which air is blown or sucked by the mouth. Recent improvements and elaborations have made of it a versatile solo instrument in the hands of an expert.

Harmonium *or* **American Organ,** a small organ of one or two manuals consisting entirely of reed stops. There is no pedal organ, the feet being used to operate the bellows.

Harp, a musical instrument of ancient origin consisting of many strings stretched on a frame. The player stands beside it and plucks the strings with his fingers. Used orchestrally in early Italian operas (17th century).

Harpoon, a kind of barb-headed spear used for attacking whales. These used to be thrown by hand, but the modern harpoon is an instrument of ingenious mechanism, with shaft, slot, and ring, and is fired from a gun.

Harp-seal, the ordinary Greenland seal, with a dark harp-shaped marking on its back, hence its name. It abounds in Newfoundland waters and further northward towards the Arctic.

Harpsichord, a keyboard instrument with a compass of up to six octaves in which stretched strings are plucked by quills. The harpsichord was an instrument of great importance from the 16th to the 18th centuries, but it was eventually eclipsed by the pianoforte, in which the plucking action (*cf.* **Harp**) was replaced by a striking action (*cf.* **Dulcimer**).

Harpy Eagle, a large bird of prey named from the winged monsters of Greek mythology, inhabiting the forest regions of Central and South America. It has a handsome grey plumage and large crest. It attacks and kills animals much larger than itself, and was called by the Aztecs "winged wolf".

Harrier, a bird of prey of the falcon family; of the various species distributed over the world, three breed in Britain: the moorland Hen harrier, the Marsh harrier, and Montagu's harrier. They are slender birds with long tails and pointed wings. They nest on the ground and eat small mammals, frogs, lizards, and small birds.

Harrow, an agricultural implement with a series of strong teeth underneath which, when pulled over it, the ground is broken up. Iron is now largely used both for teeth and frame.

Harrow School, founded 1571, is a famous boys' school with great traditions.

Hartebeest, common African antelope of a grey-brown colour, with ringed and knotted horns bending backward and tapering to sharp points; gregarious, of large size, and capable of domestication. There are several species. Its flesh is not unlike beef in flavour.

Harvard University, the first American University, established at Cambridge, Massachusetts, in 1636, by John Harvard, a settler from Cambridge, England.

Harvest Bug, a very small insect, of a dark red colour, which appears in large numbers in the fields in autumn, and is peculiarly irritating to animals and man by the tenacity with which it attaches itself to the skin and burrows underneath. Probably the larvæ of spinning mites (Trombidoids).

Harvest Moon, the full moon that occurs nearest to the autumn equinox, in September. It rises for several nights running about the same time, and yields an unusually brilliant series of moonlight nights.

Harvestman *or* **Phalangid,** animals related to the spiders. Usually with small oval bodies and extremely long thin legs. Harvestmen with shorter legs may be confused with spiders; the abdomen, however, is always segmented, a point of distinction from the spiders.

Hashish, an Arabic word for the narcotic substance prepared from the hemp plant (*Cannabis sativa*). It is known by a variety of names, *e.g.*, bhang in India and marijuana in America.

Hatchment, in heraldry, is a square board, in vertical diagonal position, placed outside a house or on the tomb at the death of a member of a family and so arranged that it indicates the sex and condition of the deceased.

Hatchways, places or openings in the centre of a ship's decks, through which goods are lowered to or lifted from the hold.

Hauberk a name first given to a portion of mail armour worn over the neck and shoulders, but

later applied to a coat of mail extending below the knees.

Hawfinch, a well-known European bird of the finch family, having a variegated plumage, a sturdy bill, and black-and-white tail. In England it is seldom found away from the Midland and Eastern Counties.

Haw-haw, a fosse or ditch sunk between slopes for defensive purposes, and not perceptible until closely approached.

Hawk. This name is applied to almost any diurnal bird of prey other than eagle, falcon, or vulture, but in its strict sense applies only to the *Accipiter* genus—the small Sparrow Hawk and the larger Goshawk, round-winged, long-tailed birds with barred under-parts. They prey upon small birds captured in flight.

Hawk-moths, large species of moths, thick of body and strong of wing, which fly with rapid swooping motion, hence its name. There are numerous handsome species in Britain.

Hearth-Money was a tax laid on hearths (in all houses paying the church and poor rates). Charles II. introduced it in 1662, and it was repealed in the reign of William and Mary.

Heat, a form of energy possessed by a body in virtue of the motion of its molecules. Heat can be conducted to other bodies and raise their temperature, or it can be radiated as waves into space. When a body changes its state, energy is involved. Thus when a liquid changes into vapour, as in evaporation, there is a fall of temperature, the energy absorbed being known as the latent heat of vaporisation. Conversely, when a gas changes into a liquid, as in condensation, the temperature rises, the energy released being known as the latent heat of condensation. Water has a great capacity for heat, the oceans being huge storehouses, a factor of the utmost importance in meteorology. The specific heat of a substance is the number of calories of heat required to raise the temperature of 1 gram of the substance through 1° C. In the case of gases the specific heat has two values, one at constant pressure and one at constant volume. *See also* **F15.**

Heath, a flowering plant of that section of the family *Ericaceæ* called *Ericeæ.* Heaths are widely distributed over uncultivated spaces of Europe and Africa. In Britain they are represented by heather (of which there are several species) and ling (*Calluna*), which cover thousands of acres of moorland. Some of the African or Cape heaths are very beautiful and much prized by florists. One species of heath (*Erica arborea*) which grows in S. Europe and N. Africa has close-grained woody rootstock used for making briar pipes.

Heat Wave is a spell of very hot weather, due chiefly in this country to a warm southerly current of air caused by the presence of an anticyclone over western or central Europe at the same time as a depression is stationary over the Atlantic. In the heat wave of May 29–June 3, 1947, temperatures of at least 85° F. were registered each afternoon in London. High humidity increases the discomfort.

Hebrews, Epistle to the, one of the books of the New Testament, to which no direct authorship can be assigned. Its chief mission was to proclaim Christianity as the continuation and fulfilment of the older Jewish faith.

Hecatomb, the name given to the public sacrifice of a hundred oxen in ancient Greece. In later times the word has been used to express any wholesale sacrifice of human beings or animals.

Hegira, an Arab term signifying departure or flight, and used in reference to Mohammed's departure from Mecca for Medina, A.D. 622, from which date the Mohammedan era is reckoned.

Helicopter, heavier-than-air aircraft which obtains its lift from blades rotating above the fuselage in windmill-fashion. The first successful helicopters were the Focke-Wulf 61, a German machine (1936), and the VS-300, designed by Igor Sikorsky, flown in 1937. Helicopters can hover, and rise and descend vertically, in addition to being capable of horizontal flight.

Heliotrope, a favourite sweet-scented flowering plant, common in tropical and sub-tropical countries; the Peruvian heliotrope is the "cherry pie" of our summer garden borders.

Helium, a gaseous element first discovered by means of the spectroscope in the sun's atmosphere. This discovery, made in 1868 by the astronomer Sir Norman Lockyer, was followed in 1895 by Sir William Ramsay's proof that the element existed on earth. He found it in the uranium ore, clevite. Later it was established that helium is formed by the radioactive decay of many elements which emit α-particles (nuclei of helium atoms) and is contained in all radioactive minerals. The largest source of helium is natural gas, the richest in helium being the gas from certain wells in Utah, U.S.A. Next to hydrogen, helium is the lightest gas known, has a lifting power equal to 92% of hydrogen and the advantage that it is inert and non-inflammable. It is used in the U.S.A. for inflating airships. Ordinary air contains 1 part in 200,000 of helium. It was the last gaseous element to be liquefied, this being achieved by Onnes in 1908 in Leyden.

Hell, according to the teaching of the earlier Christian fathers, is a place of eternal torment, to which the spirits of the wicked are doomed after mortal death. The Inferno, as imagined by Dante, is even now believed in by many; but in the general broadening of philosophic inquiry in modern times, the idea of this material hell has been greatly modified. The most orthodox of preachers in these days would hesitate to proclaim his belief in the hell of burning fires as accepted so generally a few generations ago.

Hellebore, a plant of the *Ranunculaceæ* order. The best-known British examples are the green and stinking varieties. There is also a garden kind which flowers in December called the Christmas Rose. Hellebore yields a bitter substance which forms a drastic purgative, but is now little used.

Hellenism is the pursuit of the Greek ideal of physical and intellectual culture. Matthew Arnold's doctrine of "sweetness and light" had its foundation in Hellenism.

Helmet, originally a soldier's protective head covering, now a term applied to defensive headgear generally. In mediæval times helmets were for the most part of metal, and varied in shape from reign to reign. Roman gladiators wore helmets that covered the face entirely, and the helmets worn at tournaments in the 15th and 16th centuries were so closed in that the wearers could only see through the perforations of the visor. The stiff hats worn by soldiers, policemen, and firemen generally are now styled helmets.

Helots, bondmen of ancient Sparta upon whom devolved the most menial occupations without other recompense than food and lodging.

Hemiptera, the order of insects to which belong the true bugs. Their wing structure is in most species incomplete, hence the term hemiptera. This order includes the familiar water insects, the water boatman and water skater, also the aphids, cicadas, leaf hoppers, scale insects.

Hemlock, a plant of the *Umbelliferæ* family, growing in all parts of Britain, and containing a strong alkaloid poison. Used medicinally, this alkaline substance is of considerable service, being a powerful sedative. According to Pliny, hemlock was the poison used by the Athenians in putting criminals to death.

Hemp, name of a plant native to Asia, now cultivated widely for the valuable fibre contained in the stalk or in some species in the leaves. Hemp fibre has been replaced by cotton for textiles and jute for sacks and is now chiefly used for cordage and twine. It contains a resinous substance from which the narcotic hashish is made. The seed yields a valuable oil. The term hemp is also used for other fibre plants, including manila hemp from the Philippines, sunn hemp from India, sisal from W. and E. Africa and phorium from New Zealand.

Henbane, a plant found in Britain and other parts of Europe and Northern Asia. It belongs to the potato family *Solanaceæ,* grows mostly on waste ground, and bears yellow-brown flowers veined with purple. The leaves yield a poisonous alkaloid substance which, medicinally prepared and administered, is of great use. Tincture of henbane is often preferred to laudanum.

Heptameron, a book of stories, written or compiled by Queen Margaret of Navarre in imitation of Boccaccio's *Decameron*, and supposed to have covered seven days in the telling.

Heptarchy, a word derived from the Greek *hepta*, seven, and denoting the seven kingdoms (*archai*) into which Anglo-Saxon England was supposed to have been divided before 900. The seven presumably were Kent, Essex, Sussex, Wessex, Mercia, East Anglia, and Northumbria.

Heracleum, a plant of the *Umbelliferæ* family, common in southern and central Europe, though only one species, the cow parsnip, grows in England. It has a bitter root, and from the juice of the stem an intoxicating liquor is occasionally prepared.

Herald, an officer of state empowered to make formal proclamations and deliver messages from the sovereign or other high personage whom he served. In the developments which took place in armorial bearings, the herald was the functionary charged with the duty of their proper depiction.

Heraldry, the art or science of genealogy and armorial bearings, was mainly the outcome of the love of outward distinction which prevailed in mediæval times. "Heraldry," says Stubbs, "became a handmaid of chivalry, and the marshalling of badges, crests coat-armour, pennons, helmets, and other devices of distinction grew into an important branch of knowledge." The *shield*, or *escutcheon*, is the ground upon which armorial signs are traced, the colour of the shield being called the *tincture*, the signs recorded the *charges*. There are seven *tinctures*—*or* (gold), *argent* (silver), *gules* (red), *azure* (blue), *vert* (green), *purpure* (purple), and *sable* (black). The *charges* are classed as "Honourable" and "Subordinate" ordinaries, comprising lines and geometrical forms; and "Common" ordinaries, which latter includes all representations of natural objects. There is also a system of external signs, such as crowns, coronets, mitres, helmets, mantlings, wreaths, and crests, each having its distinctive significance. For other distinguishing marks see **Hatchments, Badges, Quartering, Rampant, Pean.**

Heralds' College or **College of Arms**, was incorporated by Richard III, in 1483. Its head is the Earl Marshal (an office hereditary in the family of the Dukes of Norfolk), and there are three King-of-Arms, six Heralds, an extra Herald, and four Pursuivants. The business transacted is wholly connected with the tracing of genealogies and the granting of armorial bearings. In Scotland the Heraldic functions are performed by the Lord Lyon King-of-Arms, and in Ireland by the Ulster King-of-Arms.

Herbarium, a systematically classified collection of preserved plants. One of the largest herbaria in the world belongs to the Royal Botanic Gardens at Kew.

Herbivora, animals subsisting upon grass, herbs, or other plants.

Heredity is the study of the transmission of physical and mental characteristics from one generation to another. Gregor Mendel (1822–84), a great experimenter in the field of inheritance, considered the sex cells to be the bearers of hereditary characteristics, by which they are handed on. The modern theory is that hereditary factors are situated in the minute bodies known as genes, which form the constituent parts of chromosomes, found in the centre of the nucleus of each cell. In general, psychological characteristics are due more to social environment than to inheritance. *See* **F30** (2), **58** (2).

Heretics, a term applied to those who choose their own creed instead of adopting one imposed by authority. In the past heretics were severely dealt with, thousands being burned at the stake.

Heriot, a fine or acknowledgment of service due to a manorial lord and paid on the decease of the tenant, originally in the form of military equipment, afterwards money or beast.

Hermaphrodite, human beings, animals, or plants possessing both male and female generative characteristics. True hermaphrodites very rarely occur.

Hermit, one who retires into seclusion for the purpose of religious contemplation and a desire to live apart from the world. Hermits were regarded with reverence in mediæval times and were free to wander about. Peter the Hermit instigated the first Crusade.

Hermit Crab, a kind of crab having a soft fleshy body, without shell-protection. It possesses itself of the empty shell of some mollusc, into which it backs itself, and this usurped shell it carries about with it thenceforward, or until it has outgrown its dimensions, when it seeks a larger one. The common Hermit Crab of Britain usually resorts to a whelk shell.

Heron, a large wading bird with long curved neck and pointed bill, is a member of the *Ardeidæ* family, of which there are many species. Egrets and bitterns are included as herons. Herons are to be met with in marsh lands and near rivers and lakes, where they feed on fish and frogs. They nest in trees in large numbers, these colonies being called heronries. The common heron is native to England, and other species from the Continent are frequent visitors.

Herring, a common sea-fish abounding in northern seas and always to be found in large numbers round the British coasts. The herring fishing is the most important fish industry in this country, a very numerous fleet being engaged in it. The fishing season proper lasts from May to October, the enormous shoals being followed as they move from place to place. The spawning season is about the end of August. One female herring will yield from 20 to 50 thousand eggs, which sink to the sea-bed, where they develop.

Hexagon, a figure consisting of six sides and six angles, called a regular hexagon when all the sides and angles are equal.

Hexahedron, a solid body having six sides, particularly exemplified in the cube, or regular hexahedron.

Hexapla, a 3rd-century edition of the Old Testament in parallel Hebrew and Greek characters, by Origen.

Hexateuch, the title given to the first six books of the Old Testament, comprising the Book of Joshua in addition to the five books of the Pentateuch.

Hibbert Lectures, on theology by eminent authorities, founded in 1878 by the bequest of John Hibbert, a West Indian merchant.

Hibernation, expresses the dormant condition in which numerous mammals, reptiles, amphibians, insects, plants, etc., pass the winter. Before hibernation sets in, the animals fatten themselves up, but in spite of this there is considerable loss of weight sustained during hibernation. Animals of the torrid regions pass through an analogous period (aestivation) during the hot season, when the sources of food are dried up.

Hickory, an American tree of the walnut family, remarkable for its very hard, solid, heavy white wood, and bearing an edible, four-lobed nut.

Hickory-shirt, an American term signifying a shirt made from checked cotton stuff.

Hierarchy, a term applied to ecclesiastical or Church government, and involving a graded organisation with a supreme head.

Hieroglyphics are the earliest form of pictured symbolic expressions, and are supposed to have been introduced by the ancient Egyptians. They consist of rude depictions of animals, plants, signs, and objects, and in their later examples express, in abridged form, ideas and records from which significant historical information has been gleaned. The deciphering of Egyptian hieroglyphics long formed an ardent study, but gradually the key to the riddle was discovered, and most of the ancient records can now be understood. Besides the Egyptian there are also Hittite, Minoan and Mayan hieroglyphic scripts. (*See* **Rosetta Stone.**)

Hieronymites were hermits following the rule of St. Augustine with additions taken from the writings of St. Jerome, founded in the 14th century on the Peninsula. They went to Spanish and Portuguese America and helped to Christianize the American Indians. The order still survives in Spain.

Hindi, the great Aryan vernacular language of Northern India. In the Indian Constitution, adopted in 1950, it was laid down that Hindi in the Devanagari script should within 15 years replace English as the official language of the Indian Union.

Hinduism. The original inhabitants of India (the Dravidians) were primitive tribes who worshipped many nature gods. Some time about 2000 B.C. India was invaded from the North by the Aryans, a light-skinned and civilised people: the word Hindu is believed to be a Persian word used by the Dravidians to describe their conquerors. "Hinduism" is not only the religion but also the social institutions of about three-quarters of the population of the country. The original religion of the Aryans described in the religious books known as the Vedas mingled with the polytheism of the Dravidians to form a most complex mixture now known as Hinduism. At the highest level, known as Brahmanism, belief is in a subtle and sophisticated form of monotheism (Brahma is a universal and all-embracing spirit), but there is a tolerant acceptance of more primitive beliefs. Thus Vishnu (a conservative principle) and Siva (a destructive principle) are accepted as aspects of the deity. Krishna is said to be an incarnation of Vishnu, somewhat as Christ is in the Christian world accepted as an incarnation of God. There are, however, many other gods, and the religion embraces many primitive and crude beliefs.

Hindustani, the *lingua franca* of India, a Sanskritized Hindi vernacular introduced by the British in 1837 to replace the official Persian. It is written in Devanagari (Sanskrit) characters. The Persianized Hindi vernacular is known as Urdu.

Hippodrome, in ancient Greece, was a building set apart for horse and chariot races, and was often the scene of great spectacular performances.

Hippogriff, a fabulous animal, like a horse in body, but with the head, wings, and front legs and claws of an eagle. The monster frequently appears in the romances of the Middle Ages.

Hippopotamus, the largest living representative of the hog family, and widely distributed over Africa, where it is known as the "river-horse." It is of immense bulk, attaining a length of 12 ft. and a weight of 4 tons and stands about 5 ft. high. Its skin is hairless and about 2 in. thick, and it has a pair of tusks often weighing as much as 6 lb. It spends most of its time in the water, and lives entirely on vegetation, both aquatic and terrestrial. The pigmy hippopotamus, which occurs in forests and swamps in W. Africa, is only half the size.

Histology is that part of anatomical science which deals with those details of the human structure that can only be investigated with the aid of the microscope.

Historiography, the writing of history.

Hittites, an ancient race (often mentioned in the Old Testament) who inhabited Asia Minor and N. Syria from the third to the first millennium B.C. Excavations have revealed that they attained a high level of civilisation round about 1350 B.C. They were rivals of Egypt, disputing with Pharaoh the mastery of the Middle East.

Hobby, a bird of the falcon family, 12–14 in. long. Local breeding visitor to England and Wales, April–Sept.; irregular visitor to Scotland and Ireland.

Hog, the common name of animals of the Suina family, including the wild boar, pig, and sow. The wild boar, *Sus scrofa*, is the common ancestor. The skin of the hog is covered with bristles, the snout truncated, and each foot has four hoofed toes. Hogs are omnivorous feeders and eat almost anything that is given them.

Hogmanay, the Scottish New Year's Eve festival and a national holiday of the country. The custom of demanding Hogmanay bread is still upheld in many parts of Scotland.

Hogshead, a cask of varying capacity, also a specific measure. In the old English measure a hogshead was 52½ imperial gallons, or 63 old gallons of wine. Of beer 54 old gallons make a hogshead.

Holland, the name given to a fine kind of cloth made from flax, originally manufactured only in Holland. Brown Holland is the kind not fully bleached.

Hollands, Schiedam, or Schnapps, a kind of gin made mostly in Holland from rye and malt, with a flavouring of juniper berries.

Holly, a hardy evergreen shrub, largely grown in England. Its bright dark green prickly curved leaves and its clusters of red berries are familiar in all parts of the country, and used as house decoration between Christmas Eve and Twelfth Night. Its wood is white and hard, valued for carved work, while its bark yields a gummy substance which is converted into birdlime.

Holograph, a letter, manuscript, or document written throughout by its author.

Holy Alliance, an alliance ostensibly for conserving religion, justice and peace in Europe, but used for repressing popular tendencies towards constitutional government. Formed by Alexander I. of Russia, Francis I. of Austria and Frederick William III. of Prussia, at Paris on Sept. 26, 1815. Subsequently joined by all the sovereigns of Europe, except the Pope and the King of England. It ended after the 1830 revolution in France.

Holy Coat of Treves, a garment preserved in the Cathedral of Treves and said to have been worn by Christ. It was brought from Jerusalem by the Empress Helena in the fourth century.

Holy Grail, the cup from which Christ drank at the Last Supper, and supposed to have been preserved by Joseph of Arimathea. Many poets and romancers have made the "Quest of the Holy Grail" the subject of their imaginings, Tennyson making fine use of it in his "Idylls of the King."

Holy Rood, an annual Roman Catholic festival held on September 14th to celebrate the Elevation of the Cross in commemoration of its re-erection in Jerusalem by the Emperor Heraclius in 628 after it had been lost for nearly 300 years and had fallen into the hands of the Persians. Also included in the Church of England calendar.

Holyrood, the ancient royal palace at Edinburgh, dating from the 15th century, and inhabited by many Scottish sovereigns, notably Mary Stuart, the rooms occupied by her (including the one in which Rizzio was murdered) being still shown. It is now known as Holyrood House and is still used as a royal residence.

Holy Water, water blessed by a priest and kept in small fonts at the entrance to Roman Catholic churches, and used by worshippers going in, and out, or by priests in sprinkling.

Holy Week is the week preceding Easter Sunday, and includes the days of the Sufferings of Christ, ending on Good Friday.

Home Rule, the term applied to a separate Irish Parliament, which was the object of two Bills introduced by Mr. Gladstone in 1886 and 1893, both of which were rejected, and led to the establishment of a Liberal Unionist party of seceding Liberals. Mr. Asquith introduced a new Home Rule Bill on Feb. 12, 1912. In September strong counter demonstrations, headed by Sir Edward Carson, took place in Ulster; the Bill passed the Commons but was rejected by the Lords. On the outbreak of war party politics were set aside, and ultimately the Bill was allowed to pass, its operation to be delayed until after the war. In 1920 another Bill was passed in lieu of that of 1914, providing for a Northern Ireland Parliament, sitting at Belfast and a southern Parliament sitting at Dublin. In 1921 a Bill was passed establishing the Irish Free State, later known as Eire. The Republic of Ireland Act, Nov. 1948, established the Irish Republic as a sovereign independent state outside the British Commonwealth.

Homer (Omer), an ancient measure of capacity used in Syria, Palestine and Babylonia.

Homily, something between a discourse and a sermon; not so discursive as the one, or so elucidatory as the other.

Honey, the sweet syrup formed by bees from the nectar of flowers, the sucrose in the nectar being converted into a mixture of the simple sugars, glucose and fructose.

Honeydew, a viscid secretion, from plant lice (aphids), found on leaves, chiefly in hot weather, and looking like dew.

Honey-eater, an Australian bird (of which there are many species) provided with a long curved bill and tufted tongue. It lives by sucking the "nectar" from the flowers which abound in rural parts of Australia and New Zealand.

Honours of War, a privilege sometimes conceded to a defeated force of marching out of the place surrendered with colours flying and drums beating.

Hookah, an Oriental pipe for tobacco smoking, the smoke being drawn through the water of a goblet (commonly a coconut shell) by means of a long flexible tube.

Hook-money, an old silver currency of Ceylon, in use in the 17th century, consisting not of coinage, but of hooked pieces of actual silver.

Hookworm. A minute roundworm (*nematode*) parasitic on man, causing the disease called also hookworm or ankylostomiasis. It passes through a larval stage in the soil and then penetrates into its human host through the skin, particularly the skin of the feet. It is then carried in the bloodstream to the lungs, whence it passes to the gut via the pharynx. A heavy infection results in acute anæmia and severe debility. The disease is widespread, but most prevalent near the Equator.

Hoopoe, a remarkably handsome bird with vivid black and white-barred wings and tail and black-tipped crest which opens like a fan. Ranges over Europe, Asia, and Africa. It has bred in England and Wales and occurs in the British Isles in small numbers at all seasons. Other species are confined to Africa, Madagascar, and India.

Hoplite, the name given to a heavily armed foot soldier in ancient Greece, carrying a shield and javelin, and wearing a helmet and armour.

Hops, the female "cones" of the hop plant used in brewing; their essential oils give beer an aromatic flavour, and their tannin and resin act as a preservative as well as accounting for the bitter taste desired. The hop is a perennial climber belonging to the mulberry family. The male and female organs are on separate plants; as only the female flower-heads are commercially useful, female plants predominate in a hop garden, only a very few male plants being grown so that the female flowers can be fertilised.

Horizon, the limit of vision, the apparent line where sea and sky, or land and sky meet. This is termed the *sensible* or visible horizon. An ordinary person at the height of 5 feet can see for 3 miles, at 20 feet 6 miles, at 50 feet 9¼ miles, and at 1,000 feet 42 miles. The figures are approximate.

Horn *or* **French Horn**, a brass instrument of the trumpet family (*i.e.*, played by three valves) whose tube is very thin and long (Horn in F = 12 ft.). In consequence the tube is curled in a complicated manner. Owing to the sweet tone it is capable of producing, the Horn sometimes plays as part of the wood-wind.

Hornbill, large bird found in Africa and oriental regions, remarkable for its having an immense horned upward-curved helmet, growing over its downward curved beak. It inhabits tropical regions, and feeds on fruits. When the female has laid her eggs in the hollow of a tree, the male bird stops up the entrance, and keeps her imprisoned until the hatching is completed and the young ones are able to fly. There are several species.

Hornblende, a hard common mineral, a silicate of calcium, magnesium, iron and aluminium, of a dark green colour. It is a constituent of numerous rocks, including diorite, syenite, and hornblende schist.

Horn Book, a children's alphabet and primer which has a cover of this horn. It was in use until about a hundred years ago.

Horned Viper, a curious African genus of *Viperidæ*, with a small pointed bone over each eyebrow; a venomous species, found in Egypt, is thought by some to be identical with the "adder" mentioned in Genesis xlix. 17.

Hornet, a general name for many of the bigger wasps. It usually nests in hollow trees, and despite its rather fiercesome appearance does not sting unless unduly provoked.

Hornpipe, an old English single-step dance, which used to be executed to the music of an ancient hornpipe, hence its name.

Hornywink, a popular name for the lapwing.

Horology, the science of time-measurement, including the construction and management of clocks, watches, etc. Instruments of this kind are not known to have existed before the 12th century, and until the introduction of the pendulum in the 17th century, clocks were ill-regulated and inaccurate. The time-recording mechanisms of the present day include (*a*) the *clock*, which shows the hours and minutes by hands, and strikes the hours, and sometimes quarters; (*b*) the *timepiece*, which is not generally a fixture and shows the time, but does not strike; (*c*) the *watch*, which is a pocket time-keeper; (*d*) the *chronometer*, which indicates the minutest portions of time; (*e*) electric timepieces, mains electric clocks; (*f*) the highly accurate quartz-crystal and atom clocks used for astronomical purposes. *See also* **Clocks.**

Horoscope, an astrological term, indicating the reading of the signs of the planetary bodies, according to the methods of the astrologers, at the date of a personal nativity, or other given date. In ancient times there were astrologers attached to the various courts, and their "castings" and predictions had many believers.

Horse Chestnut, one of the large forest trees, with ample branches, and full foliage, and much esteemed for parks and ornamental grounds. The bark and fruit seeds yield substances of commercial value, but the timber is not worth much. The tree came originally from Asia about the 16th century.

Horse Guards, the building in Whitehall which until 1872 was the headquarters of the Commander-in-Chief of the British Army. The archway is still sentinelled by mounted guards.

Horse Latitudes are the belts of calms between the regions of the trade winds and the westerlies of higher latitudes. At one time when ships transporting horses were becalmed in these belts the horses were thrown overboard.

Horse, Master of the, the Court official having charge of the royal stables, the provision of horses, carriages, and motor-cars for the royal family. The duties are actually carried out by the Crown Equerry.

Hospice, a place of refuge and rest for travellers and pilgrims. The most famous is that of the St. Bernard Pass, where dogs are kept for the succour and help of belated wayfarers.

Hospitallers, Knights, were of the order of St. John of Jerusalem, at first devoted to the aid of the sick, but afterwards military monks, who became prominent figures in the Crusades of the 12th century. They adopted the Benedictine black habit with the eight-pointed cross worn by the modern St. John's Ambulance Brigade. In 1309 they took Rhodes, but were expelled by the Ottomans in 1522. In 1530 the emperor Charles V gave them the island of Malta, which, as Knights of Malta, they held until 1798, when they were dislodged by Napoleon. The Knights still survive as a sovereign order, with headquarters in Rome. (*See* **Templars** and **Teutonic Order.**)

Hospitals. The earliest hospital is supposed to have been at Cæsarea in the 4th century. In the 7th century the Hôtel Dieu was founded in Paris; in the 9th century there were 24 hospitals in Rome. Some of the earliest hospitals of Great Britain are in London; St. Bartholomew's 1123, Bethlehem 1247, St. Thomas's 1213, Westminster 1720, Guy's 1724, London 1740. The British hospitals have in the past been largely dependent on voluntary contributions. There are excellent equipped medical schools attached to most general hospitals, and expert research workers are engaged on the investigation of diseases. (*See* **The National Health Service, P62.**)

Hôtel des Invalides, the famous military hospital and soldiers' home in Paris, founded in 1670, and one of the attractions of the city in later years, as it contains the tomb of Napoleon.

Hottentots, name given to certain African natives by Dutch settlers in the 17th century. They used to occupy the greater part of Cape Colony, and though driven out a number still survive in S.W. Africa. Appear to be related to the Bushmen, though their culture is more advanced. In addition to herding, they practise some farming and know how to smelt iron.

Hounds are dogs that were originally bred and trained for hunting, such as the greyhound, foxhound, bloodhound, wolfhound, deerhound, beagle, harrier, etc., but now often kept also as domestic dogs. The greyhound, deerhound, and wolfhound hunt by sight, the others, with the bloodhound first in order, track by scent.

Hour-glass, a glass instrument tapering to the middle to a narrow orifice, through which a

sufficient quantity of fine sand gravitates to mark an hour of time. When the sand has run through from one end, it can be reversed and made to count the hour in the opposite direction. The same kind of glass with smaller supplies of sand will indicate shorter periods, as an egg-glass, which runs its course in three minutes—time to boil an egg by.

Houris, according to the Koran, are beautiful nymphs of paradise set apart to attend upon the "faithful" Mohammedans as they enter the celestial abode.

House Flies abound in all countries and are exceedingly prolific. Their eggs are hatched within 24 hours of being deposited, and full maturity is attained in a month. They feed mainly on decayed animal and vegetable matter.

Hovas, the dominant tribe in Madagascar until the French took possession of the island in 1895.

Howdah, a railed, canopied seat fitted on to the back of an elephant for conveying people in. The name is also given to a somewhat similar contrivance for the backs of camels.

Howitzer, a cannon, short and light in proportion to its bore, used for throwing shells and case-shot and requiring a comparatively small charge.

Howler Monkey, a species of South American monkey noted for a laryngeal conformation which enables it to emit a loud reverberant noise something between a yell and a howl, as the name suggests. The peculiarity is developed most strongly in the males, which are the largest American species.

Hoy, a small sloop-rigged vessel usually engaged in light traffic, such as conveying passengers and goods from the shore to steamers, or *vice versa*.

Huanuco-bark, a medicinal bark, brought from the Peruvian town of that name, and derived from the *Cinchona micrantha* tree.

Huguenots, a name applied to the French Protestant communities of the 16th and 17th centuries. Henry of Navarre, by the Edict of Nantes in 1598, granted them religious freedom, but more than a quarter of a century before—Aug. 24, 1572—thousands had been put to death in the massacre of St. Bartholomew. The revocation of the Edict of Nantes by Louis XIV. in 1685 drove thousands into exile in England, Holland, Germany, and America.

Humanism, represents a system of education based not only on the Greek and Latin classics but also on the civilisation of the Renaissance.

Humble-bee or **Bumble-bee**, the common name of the insects of the genus *Bombus*, of the Hymenoptera order. They live in small communities comprising males, females, and neuters, their habitations being underground. They do not have one queen bee only like the hive bee, but several females occupy the same nest, and these alone live through the winter, breeding and forming new colonies in the spring. Although this large bee buzzes loudly, it does not sting.

Humidity, the state of the atmosphere with respect to the water-vapour it contains. "Absolute humidity" is defined as the density of the vapour present, while "relative humidity," more frequently employed, indicates the degree of saturation, *i.e.*, the ratio of the actual vapour pressure to the saturation vapour pressure at the particular temperature, expressed as a percentage.

Humming Birds are so called because of the humming noise made by the vibration of their wings in flying. They are of radiant plumage, and in size they are among the smallest birds. There are from four to five hundred species, and they are confined wholly to North and South America, being most numerous in the tropical latitudes. They have long, slender bills and tubular tongues which reach down into flowers to suck up the nectar on which they feed.

Hummum, the original name for what is now called the Turkish Bath in this country. One of the first of these baths to be established in London was the Hummums in Covent Garden.

Hundred, the ancient divisional name given to a portion of a county for administration or military purposes. It is supposed to imply the territory occupied by a hundred families; or the space of a hundred hides of land, or the capacity of providing 100 soldiers. Each hundred has its hundred court, with powers similar to those of a manor court, but this was abolished in 1867 by County Court Act.

Hundred Days, the interval of time between Napoleon Bonaparte's entry into Paris after his escape from Elba and his departure after his abdication, extending from March 20, 1815 to June 28. During this period occurred the battle of Waterloo, June 18.

Hundredweight in Great Britain is 112 lb. avoirdupois; in the United States it is an even 100 lb.

Hundred Years' War, a term applied to the almost incessant contest between England and France, lasting from 1338 to 1453, including such famous battles as Crécy, Poitiers, and Agincourt, and engaging successively Edward III., Henry V., and Henry VI., among English kings.

Huns, a fierce Asiatic race which swept over eastern Europe in the 4th century. Under Attila about the middle of the 5th century they obtained control of a large portion of central and eastern Europe, forcing even Rome to pay tribute. Their defeat at Châlons-sur-Marne in 451 and the death of Attila in 453 terminated their empire.

Hunterian Museum, a celebrated collection of anatomical specimens originated by John Hunter, the distinguished surgeon and physiologist, towards the end of the 18th century in London, and now in the possession of the Royal College of Surgeons. Dr. William Hunter, the brother, founded a Hunterian Museum at the University of Glasgow.

Hurdy-Gurdy, an Italian rustic so-called musical stringed instrument of the lute order, the sounds of which are produced by the action of a rosined wheel turned by the left hand, the notes being made by the fingering of the right hand.

Hurricane. (*See* **Cyclone** *and* **Wind.**)

Hussites, followers of John Huss, the Bohemian reformer and disciple of Wyclif, who was burned at the stake in 1415. After their leader's death, the Hussites became a formidable body, and took up arms on behalf of their faith, their religion being strongly imbued with political feeling. In spite of persecution they survived until the Reformation.

Hyæna, a carnivorous quadruped of which there are three species: striped, or laughing hyæna common to North Africa, India, Syria, and Persia, and noted for the peculiar cry from which its name is derived; the brown hyæna, with long shaggy hair, a native of Southern Africa; and the spotted hyæna, also confined to Africa. They have great jaw-power, and are of nocturnal habits.

Hydra, an aquatic animal of simple structure, whose body is in the form of a cylindrical tube, with a disc-shaped base by which it attaches itself to any shifting substance. Its mouth is surrounded by tentacles by which it catches its food. The Hydra has the power of reproducing lost parts. *See also* **F24** (1).

Hydrates are compounds containing water of crystallisation.

Hydraulic Press, perfected by Joseph Bramah, the inventor, in 1795, is a useful apparatus, the pressing power of which is obtained by the action of water. Two plates, the upper one movable and attached to a large piston, the lower one fixed, are contained within two uprights. The movable piston works in a cylinder of water in connection with a small force-pump, and the pressure is applied by moving a level which brings a well-known hydrostatic law into operation, and presses the material between the two plates to the required degree. The hydraulic press is largely used for compressing articles for packing, and for extracting purposes.

Hydraulic Ram, a form of automatic pump, used to raise water to a height by the action of its own falling velocity.

Hydraulics, the science of applied hydrodynamics, or water-machine engineering, ranging from pumps to marine engines.

Hydrocarbons are compounds of carbon and hydrogen. They include the *paraffins*, which are saturated compounds (*e.g.*, methane); the ethylene, acetylene and other series which are unsaturated; compounds with ring structures, *e.g.*, benzene, naphthalene, and anthracene. Petroleum is composed almost entirely of hydrocarbons.

Hydrochloric Acid, a colourless gas, consisting of hydrogen and chlorine, and resulting in con-

siderable quantities as a by-product of the soda-ash or salt-cake manufacture. Its solution forms the common hydrochloric or muriatic acid of commerce. It is present to the extent of nearly half a per cent. in the digestive juice secreted by the stomach.

Hydrocyanic Acid, cyanide of hydrogen or prussic acid; very poisonous, and of the odour of bitter almonds. Discovered by Scheele in 1782.

Hydrodynamics, the science of fluids in motion.

Hydrofluoric Acid is obtained by distillation of fluorspar with sulphuric acid, and is a compound of fluorine and hydrogen. Its action is highly corrosive, it is a valuable agent in etching on glass, and is a rapid decomposer of animal matter.

Hydrogen, a colourless gaseous element and the lightest of all substances. Cavendish in 1766 was the first to recognise that it was an element. It is 14·4 times as light as air, and is found in a free state in volcanic regions. It can be obtained by the action of metals on acids, and when burned in air combines with oxygen to form water. Commercially it is used to produce the very hot flame of the oxy-hydrogen blow-pipe for cutting metals; to fill balloons and airships; to harden certain oils and render them suitable for margarine- and soap-production. *See also* **Deuterium.**

Hydrography, the science of water measurement, as applied to seas, rivers, lakes, currents, rocks, reefs, etc., and embracing the whole art of navigation.

Hydrometer, an instrument for measuring the specific gravity of liquids, especially for ascertaining the strength of spiritous liquors and solutions. It is usually in the form of a glass bulb, to the lower end of which a smaller bulb, containing mercury, is attached, which forces the instrument to sink into the liquid which it is to test. The larger bulb has a scale fixed to it, and the indication on this scale of the sinking point shows the specific gravity. There are many varieties: Twaddell's—a pear-shaped bulb containing mercury: Beaumé's, of similar construction, but applicable to liquids both heavier and lighter than water: Sykes's, largely employed for determining the strength of alcohol: and Nicholson's, used for taking the specific gravities of solids.

Hydropathy, the method of treating disease with water, either by bathing or drinking. Natural springs of special chemical and therapeutic properties, such as sulphur springs, and other mineral sources, have been used since prehistoric times for this purpose. It is probably one of the most ancient methods of cure. Recently the beneficial effects of pure water treatment have been advocated. Hydropathic establishments have been set up in many health resorts.

Hydroponics, the culture of plants without soil. The plants are grown with their roots dipping into a solution of nutritive mineral salts; or they may be rooted in sand which is watered with such a solution.

Hydrostatics, the science of the pressure and equilibrium of liquids that are non-elastic.

Hydrozoa are, zoologically, a low order of water animals of the *Cœlenterata* sub-kingdom to which Hydra (*vide*) belongs. In one order of the Hydrozoa, free-swimming colonies showing marked division of labour between the individual units occur; this order includes the Portuguese man-of-war. *See* **F24** (**1**).

Hydrus, a constellation of the southern celestial hemisphere commonly called the Southern Snake.

Hygrometer, an instrument for measuring the amount of water vapour in the atmosphere. A simple form of hydrometer, known as the wet-and-dry bulb, consists of two vertical thermometers affixed to a frame. One bulb is exposed to the air, and the other is covered with muslin which dips into a water-bath to keep it moist. If the air is saturated, it takes up no moisture from the wet bulb and the two thermometers read the same. If the air is not saturated, evaporation takes place from the wet bulb, latent heat is absorbed from the air, and the temperature of the wet bulb is lower than that of the dry bulb. Relative humidity and dew-point of the air can then be derived from suitable tables. Hygrometers depending upon the expansion of human hair and gold-beater's skin and the deposition of dew on a polished surface, when cooled sufficiently, are also in general use. (*See* **Humidity.**)

Hymenoptera, the order of insects to which bees, wasps, hornets, ants and sawflies belong. They are notable for having four wings, the hind pair smaller than the front pair, to which they are attached by a row of hooks. They have mouths and tongues which enable them to bite, or to bite and suck, and the females possess an ovipositor used both for depositing eggs and stinging. There are about 70,000 species in this order.

Hypnosis. Hypnosis, also known as Mesmerism, is an increased degree of suggestibility which sometimes leads to superficially puzzling phenomena. It must have been known in the East for many centuries, but was rediscovered towards the end of the 18th century by the Viennese Anton Mesmer, after whom it was named Mesmerism. The discovery created a sensation all over Europe at the time; for Mesmer was, although brilliant, somewhat of a charlatan and made the most fantastic claims. In his salons in Paris he claimed to cure all sorts of diseases by the new method, and since many illnesses are, in fact, neurotic in origin, numerous patients were cured. Mesmer believed that his cures were due to what he called "animal magnetism"—a physical influence passing from the operator to the patient, but this is now a discredited belief. As the British physicians Elliotson and Braid and the Frenchmen Charcot and Bernheim showed, hypnosis is a purely psychological state of increased suggestibility due to the influence of the operator on the patient in the emotional sense. There is nothing mystical about it. Nevertheless, the states which can be produced by hypnosis are astonishing enough: the patient can be put to sleep or can be made unable to feel pain so that a limb can be removed while he is in this state; he can be paralysed so that he is unable to move, and even blisters can be produced on the skin by the suggestion that it is being burned with a hot piece of metal.

Hypocaust, an arched fire vault or chamber through which heat is distributed to rooms above. Used in the baths of ancient Rome.

Hypostyle, an architectural term, designating a colonnade or pillared hall, such as in the famous hall of Karnak. *See* **G16** (**1**).

Hypsometer, an instrument formerly used by mountaineers to find the height above sea-level by indirectly measuring the atmospheric pressure by determining the boiling point of water at the particular height. Based on the fact that as pressure decreases with height so the boiling point is lowered. Superseded by the aneroid barometer.

Hyrax, an animal of the order *Hyracoidea*, possessing a cleft upper lip like the hare, molar teeth shaped similar to those of the rhinoceros, and in other respects showing ordinary rodent characteristics. It has a brown fur, and is confined to Africa, Syria, and Arabia.

I

Ibex, wild goats of several species found in the mountain regions of Europe, Asia, and Africa. The male has exceedingly large curved ridged horns. The species that lives in the Alps is called the steinbock or bouquetin.

Ibis, belongs to a family of birds related to the stork. The sacred ibis of ancient Egypt is now extinct in Egypt but is found in the lakes and swamps of the Sudan near the Upper Nile. It has white and black plumage and a long curved beak. Other species are found elsewhere, the Glossy Ibis (black plumage glossed with purple and green) occasionally visiting England.

Ice is frozen water. It is a colourless, crystalline and brittle solid. Being only 92% as dense as water, it floats on the latter; the expansion which occurs as water changes into ice causes the fracture of water-pipes, though the fracture only becomes obvious when the ice melts and leaks out through the crack. The temperature at which ice forms is 0° C., 32° F. Ice can be melted by pressure, and the ease and smoothness

with which one is able to skate on ice depend on this phenomenon.

Ice Ages. It is known from the evidence of the rocks that there have been three major glacial periods in the geological history of the earth, separated by long periods of time: the earliest in pre-Cambrian times, 600–700 million years ago, the second in late Palæozoic times, 250 million years ago (in the southern hemisphere), and the third (The Great Ice Age) in the Pleistocene period, when an ice-sheet covered northern N. America and northern Europe. From the evidence of fossils world climates appear to have been temperate during the inter-glacial periods. *See* **F9** (1), **19** (2), **32** (2).

Ice Age, Great, began at the end of the Pliocene period more than half a million years ago when immense glaciers and ice sheets extended over large areas of the continents. There were four cold periods known as the First, Second, Third, and Fourth Ice Ages, separated by interglacial periods when the climate was warmer. During the Pleistocene Ice Age, as the Great Ice Age is sometimes called, the ice sheets in the British Isles reached as far south as the Thames valley.

Icebergs are detached masses of glacier which subside into the sea and float as wind or current may take them. About one ninth of an iceberg is above sea-level. The North Atlantic is the chief home of icebergs, which reach the ocean from the ice-clad plateaux of Greenland. Some of these floating masses of ice are of enormous proportions, and constitute in the spring and early summer seasons a great menace to the safety of ships, as was disastrously shown in the *Titanic* catastrophe of 1912. For some years past these menaces to N. Atlantic shipping have been kept under close observation by vessels specially detailed for this work.

Ice-breaker, a special heavy bow-plated ship for forcing a way through ice and used especially at ports of the Baltic Sea and the Great Lakes region of Canada which freeze during the winter months. The Soviet atomic ice-breaker *Lenin*, the first of its kind in the world, launched in Dec. 1957, is designed to cut a channel through ice of any thickness. Her icebreaking performance will allow the sea-route to the north of Siberia to be kept open throughout the year.

Icelandic Literature, the Old Norse, which includes numerous works of poetry, mythology, and history of interest and importance. (*See also* **Edda.**)

Iceland Moss, a kind of lichen (*Cetraria*) which grows in great quantities in the mountain regions of Iceland and other Northern countries. It posseses certain nutritive qualities and is of some value in medicine.

Iceland Spar, a colourless form of calcite (calcium carbonate), frequently found in association with metallic ores; it has the power to produce strong double refraction of light so that two images are seen of an object viewed through a piece of Iceland spar.

Iceni, an ancient British race who in early times lived in Norfolk and other parts of Eastern England. Their most famous ruler was Queen Boadicea, who led her people against the Romans in A.D. 61.

Ice Plant, also called "dew plant" and "diamond plant." A South African mesembryanthemum commonly grown in British gardens. Its name is derived from the fact that the leaves are covered with small glistening bladder-shaped hairs that look like ice crystals.

Ice Saints, St. Mamertus, St. Pancras and St. Servatius, so called because of the legendary cold on these Saints' Days, namely, May 11–13.

Ichneumon, the Egyptian mongoose, popularly known as "Pharaoh's Rat." It is of great use in checking the multiplication of reptiles. It is frequently domesticated.

Ichneumon Fly, a numerous group of hymenopterous insects abounding in many lands, and all having the peculiarity of depositing their eggs in the bodies of other insects. It destroys swarms of caterpillars, which become the unwilling hosts of its progeny.

Ichthyology, the department of zoological science which concerns itself with the structure and variation of fishes, their habits and distribution.

Ichthyornis, a fossil bird with teeth discovered in the cretaceous strata of Kansas. About 8 in. in height.

Ichthyosaurus was a gigantic marine reptile of the Mesozoic age. The fossils are mostly found in the lias formation. Some were not less than 30 ft. in length.

Iconoclasts were originally an Eastern sect of the 8th and 9th centuries, whose object was to prevent the worship of, and to destroy, images used in religious rites. Also any Protestant who took part in or supported the destruction of images in churches in the 16th and 17th centuries. The term has been applied in modern times to enemies of religious beliefs generally.

Idealism. Idealism is the belief that there is no matter in the universe, that all that exists is mind or spirit. Most philosophers have held that there were two principles, mind and matter; a few that the only reality was matter (*see* **Materialism**). Kant, Descartes, Locke, and even Plato believed in both spirit (mind) and matter; for, if Plato is often considered to be an idealist, he did believe that the universe contained physical objects, although spirit alone was the "real" world. Berkeley (1685–1753), a great British divine and philosopher, later Bishop of Cloyne in Ireland, was an idealist who believed that the universe was an idea in the mind of God, but the great period of pure idealism was 19th-century Germany. Fichte, Schelling, Hegel, Lotze, Schopenhauer, and Schleiermacher are its main philosophers. Fichte believed that the whole universe was God (that is to say, he was a Pantheist—one who believes that God is everything). Schelling thought that the universe was a world-spirit, which, however, only became self-conscious in man. Lotze believed that the universe was alive and was mind; Schleiermacher that God was the source of all life, but was more than the universe. Hegel, the greatest of the idealists, believed that the universe was a process of thought in continual evolution; in nature the process is unconscious, but in man the process becomes fully self-aware.

Ides, in the ancient Roman Calendar, the 15th of March, May, July, October, and the 13th of all other months; always the eighth day after the Nones.

Idiograph, a mark, signature, or flourish peculiar to any individual; a trade mark is an idiograph.

Idiom, an expression characteristic of a country, district, dialect or language, which usually gives strength and force to a phrase or sentence. The idioms of a language are its distinctive marks, and the best writers are the most idiomatic.

Idolatry, the worship of idols, images, inanimate objects, animals or symbols. A kind of idolatry existed in all primitive modes of existence, and instances are numerous in the earliest records. In their most symbolised form images have a considerable part in the rites of the Roman Catholic Church.

Idols are images or effigies which are made objects of worship and are usually of wood or stone, but sometimes of ivory or more precious materials, and attain their symbolic significance after being put in the places destined to receive them, when they are made objects of veneration by some religious dedication.

Idris, a famous giant belonging to the myths of Wales, commemorated by a chair of rock on the top of the Cader Idris mountain in Merionethshire.

Idyll, a poem or story of a simple or pastoral kind dealing with rural characters and events for the most part, but sometimes used in a broader sense, notably in Tennyson's "Idylls of the King," which are of a distinctly imaginative form.

Ignatian Epistles, letters bearing the name of St. Ignatius, the authenticity of which is now generally accepted, and in their several forms exercised great influence in mediæval times. Fierce controversy raged around them in the 17th century, because of their strong support of episcopacy, and a good deal of doubt was thrown upon their genuineness.

Igneous Rocks are such as have been molten under conditions of great heat at some stage in their history: *e.g.*, granite, basalt. *See* **F8** (2).

Ignis Fatuus *or* "**Will-o'-the-wisp,**" a phosphorescent light which may often be seen on summer and autumn evenings hovering over marshy

ground or graveyards. Its nature is hardly understood, though it is generally believed to be the result of the spontaneous combustion of the gases from decaying organic matter. In olden times when marshy grounds were more common than now, this "dancing light" was very frequently visible and was regarded with superstition.

Ignorantines, a Roman Catholic Order founded in 1679 at Rheims, reorganised by Jean Baptiste de la Salle and intended for special ministration among the children of the poor. The name "Ignorantine" was given to them because the admission to the order of priests with a theological training was forbidden.

Iguana, large South American lizards, with a long tail, a scaly back and head, a thick fleshy tongue and a prominent dew-lap in the throat. Specimens of the different species average 4–5 ft. in length, and they live mostly in trees, though they are equally at home on land or in the water. The flesh of some species is good eating, as are also the eggs.

Iguanodon, a genus of extinct dinosaurs, whose fossils are found in the jurassic and cretaceous rocks. Iguanodons were 15–25 ft. long, and walked on their hind legs, the front legs being small and adapted for grasping the branches of trees on the leaves of which they fed.

Ilex, mentioned by classical authors, is the holm- or holly-oak, which flourishes round the Mediterranean. To botanists Ilex is the genus to which the holly and maté plant belong.

Iliad, the great epic poem of ancient Greece attributed to Homer (*c.* 700 B.C.). It consists of ancient folk tale and saga, welded into an artistic unity, having as plot the carrying off of Helen by Paris to Troy and the subsequent siege of Troy. *See* **G20 (1)**.

Illuminated MSS. of great value and beauty of decoration exist in most public museums and in many private collections, some of them being of great antiquity, especially those of ancient Egypt executed on papyri. Greek and Latin specimens are also numerous, and the British Museum contains fine examples of all these kinds and also an extensive collection of mediæval English MSS.

Illuminati, the name by which certain religionists of the 16th, 17th, and 18th centuries were known. They claimed the possession of superlative knowledge in everything pertaining to religious doctrines, rites and ceremonies, but were not at any time a very numerous body. An Order of the Illuminati was formed at Ingolstadt which was a secret society, and professed to free religion and politics from superstition and despotism. It has some similarity to freemasonry.

Ilmenite, a mineral widespread in igneous rocks: chemically it is an oxide of iron and titanium. Rich deposits have recently been found in the Allard Lake area of Quebec; the Travancore sands are also a source of ilmenite.

Imagination is the creative power and faculty enabling the mind to picture to itself scenes, events, and persons of which a person may hear or read, and in its more intense form constitutes the genius by which the poet, the novelist, the historian, the painter, and the musician attain their idealisations.

Imam, a Mohammedan religious title borne only by princes or leaders of the faith.

Imbrex, an architectural term given to the covering tile of the ancient roof.

Immaculate Conception, the dogma that the Virgin Mary was absolutely pure and sinless from the womb, after being a fierce subject of controversy for many centuries, was on Dec. 8, 1854, expressly proclaimed by Pope Pius IX. to be an established doctrine of the Roman Catholic Church. Dec. 8 is the festival day of the Immaculate Conception in the Roman Church, and Dec. 9 in the Greek Church.

Immortelles are wreaths, crosses, or other designs made from what are called everlasting flowers, which are obtained from certain plants of the Composite order, and retain their colours and compactness for a long time. Immortelles are largely used as mementoes for decorating graves, especially in France.

Impeachment, a special arraignment, usually before Parliament or other high tribunal, of a person charged with some offence against the State. The custom in England was for the impeachment to be made in the House of Commons, and the trial to be before the House of Lords. The first instance occurred in 1376 when Lord Latimer was impeached. With present parliamentary procedure, impeachment is no longer necessary, since the Cabinet is responsible for the individual actions of its ministers, who, acting as a team, must carry the Commons with them, or resign, when it falls to the Leader of the Opposition to form a new Cabinet. Other famous impeachments were those of the Lord High Chancellor Francis Bacon (1621), Earl of Strafford and Archbishop Laud (1640), Warren Hastings (1788), the last being that of Lord Melville (1805). Under the constitution of the United States public officials may be impeached by the House of Representatives and tried by the Senate. The most famous case was that of President Andrew Johnson.

Impluvium, a basin or tank in the hall or atrium of an ancient Roman house, serving the purpose of receiving the rain that dropped through the open space in the roof.

Impressment, the forced seizure of persons for service on board British war-ships, sanctioned by laws still unrepealed, but not resorted to in this country since the Napoleonic wars.

Imprimatur, originally an official licence to print, and an important formula in the early days of printing. The term is now used in the wider significance of authority, stamp, or endorsement.

Impromptu, a piece of music for orchestra or solo instrument of informal construction and composed without preparation.

Inbreeding, mating of closely related animals and plants. Close inbreeding has long been held to be harmful, but this is not necessarily so, for if practised with selection, stock can be purged of the undesirable qualities and the race improved.

Incas, an Indian people who inhabited ancient Peru, founded a great empire, and reached a high level of civilisation; overthrown by the Spaniards in 1533. *See* **G10**.

Incense, an aromatic resinous substance which, under combustion, exhales a pungent odour, and is used, mixed with certain fragrant perfumes, in the celebration of Mass in Roman Catholic churches. Olibanum or frankincense is ordinarily the leading ingredient. It is not used in the orthodox service of the English Church except by the more pronounced Ritualists.

Incisors, the sharp-edged cutting teeth at the front of mammalian jaws.

Income Tax, a tax of so much in the pound sterling of income from whatever source, all persons resident in Great Britain and Northern Ireland, and all persons not resident in, but deriving income from property, trade, or employment in Great Britain and Northern Ireland being liable to assessment. Income is classed under five schedules: (*a*) from the ownership of land, buildings, etc.; (*b*) from the occupation or use of land; (*c*) from Government or public stocks; (*d*) from trade, profession, or vocation, remittances from abroad, bank interest, etc.; (*e*) from salaries, wages, pensions, emoluments, directors' fees, etc.

The income-tax year is from April 6 to the following April 5. Rates of tax on taxable income for the year 1960–61 are as follows:—on the first £60, 1*s.* 9*d.* in the £; on the next £150, 4*s.* 3*d.*; on the next £150, 6*s.* 3*d.*; and on the balance 7*s.* 9*d.* in the £. *Taxable* income is found by deducting from *Total* income certain allowances.

(1) *Earned Income* allowance of two-ninths to £4,005 and one-ninth to £9,945, up to a max. of £1,550.

(2) *Personal* allowance of £140 to single persons and married women in employment; to married man living with his wife, or if wife though not living with, is wholly maintained by means of a voluntary allowance, £240. If the wife is maintained under a Court Order or under a binding legal agreement the allowance is reduced to £140.

(3) *Child* allowance of £100 for each child under

11; £125 over 11; and £150 over 16 if still being educated; provided child does not earn more than £85 a year.
(4) *Dependent Relative* allowance of £75 for each relative or wife's relative maintained whose own income does not exceed £135. Relief reduced by £1 for every £1 by which relative's own income exceeds £135.
(5) *Widow and Widower* allowance of £40 (certain restrictions).
(6) *Daughter's Services*, necessary owing to old age or infirmity, allowance of £40.
(7) *Housekeeper* allowance of £75 (certain restrictions).
(8) *Age* allowance of two-ninths of unearned income where taxpayer (or his wife) is over 65 and total income does not exceed £800.
(9) *Life Insurance*. Subject to certain restrictions, an allowance for the premiums paid for life-insurance of tax-payer and his wife, but not on life of his child or any other person, to a maximum of two-fifths on premiums over £25.
(10) *National Insurance* flat rate of £15 for adult employees.

Age Exemption: no tax payable by single persons aged 65 or over if income does not exceed £275; £440 for married couples where either is 65 or over. Appropriate marginal allowances.

Pensions qualify for the earned income relief of two-ninths.

Surtax is paid on all incomes exceeding £2,000 (after deduction of certain allowances) on a sliding scale, increasing from 2*s*. in the £ with the size of the income.

Independence Day, commemorates the adoption of the Declaration of Independence on July 4, 1776. July 4 is celebrated as a holiday in the United States.

Independent Television Authority was set up in August 1954 under the Television Act, 1954, to provide television services additional to those of the B.B.C. Its statute runs for 10 years. The Authority consists of a Chairman (Sir Ivone Kirkpatrick, G.C.B., G.C.M.G.), a Deputy Chairman and eight members. At the head of the Authority's permanent staff is the Director-General, Sir Robert Fraser. Privately financed companies provide the programmes, advertisers pay the programme companies for their advertisements, and the Authority itself acts as controlling body.

Index Expurgatorius is an index, prepared under the authority of the Roman Catholic Church, of such books as may not be read by the faithful at all, and such as can only be read in part: that is, with what are considered objectionable passages expunged. The first Expurgatorial List was issued by Pope Paul IV. in 1559 and all later lists have been under direct papal authority.

India Office Library (since 1947 called the **Library of the Commonwealth Relations Office (Division B)**). This is an orientalist library, which specialises in Indian studies. It was founded in 1801 by the East India Company, and contains 20,000 manuscripts in European languages and in Sanskrit, Persian, modern Indian, and other oriental languages, and a quarter-of-a-million printed books, of which three-quarters are in oriental languages. There are also collections of drawings, photographs, and other objects of oriental interest. It is accessible to *bona fide* students.

Indian Ink, a pigment made from lampblack and gum or glue, originally prepared in China and Japan. It is dried and marketed in small sticks and used mainly by artists for shading and lettering.

Indian Mutiny. This turning-point in the history of modern India occurred in 1857–58. The ostensible cause was the serving out to the native troops of cartridges greased with animal fat, for contact with this was forbidden both by the Hindu and Mohammedan faiths. A rebellious feeling, however, had long been developing, and when the Sepoys at Meerut in May 1857 refused to obey the English officers, overpowered and put them to death, the mutiny spread like wildfire. The rebels took Delhi and Lucknow, and for many months terrible massacres and atrocities were committed; men, women and children were slain in thousands. Order was re-established in the autumn of 1858 when the governing power was transferred from the East India Company to the Crown.

Indian Summer is applied to a warm spell of weather occurring in the late autumn.

Indicators, substances which by a marked change in colour are used to indicate the course of a chemical reaction. Litmus paper, for instance, is red with acids and blue with alkalis. In biological work some radioactive substances are used as tracer elements.

Indictment, a formal document of accusation setting forth the criminal charge or charges upon which a person has to be tried before a proper tribunal. It represents the "finding" of the grand jury, and is framed on the "true bill" returned by that body.

Indigo, the substance obtained from the plant *Indigofera tinctoria*, a native of S. Asia, India being the chief producing country. The colouring matter is the result of the decomposition and fermentation of a glucoside contained in the plant. This is afterwards dried and becomes the caked indigo of commerce. Natural indigo has been eclipsed by artificial indigo, a coal-tar dye which came into commercial production at the end of the last century, which is cheaper and more uniform in quality.

Indium, a scarce lead-coloured metal found in zinc blende in Saxony and certain other ores. This element was discovered in 1863 by Reich and Richter. *See also* **F66**.

Individualism, a theory of government which favours freedom of action on the part of the individual without the interference of the state; opposed to state-planned economy and collectivisation. The extreme form of individualism is anarchism.

Indo-European, a term used to designate the great Aryan family of languages, which embraces Indo-Iranian, Celtic, Greek, Italic, Slavonic, and Germanic. Basque, Magyar, Turkish, and Finnish do not belong to this family.

Indra, an ancient Hindu god, personifying the sky; the supreme object of worship in Vedic times.

Indulgence. In the Roman Catholic Church the remission granted by ecclesiastical authority to a repentant sinner of the temporal punishment still due after the guilt of sin has been forgiven by God. The indiscriminate sale of Indulgences by Tetzel and other Papal agents in the 16th century was one of the grievances which led to the Reformation.

Indulgence, Declaration of, was the proclamation by which James II. suspended the penal laws against Roman Catholics and Dissenters. It was issued in 1688, but the clergy as a body refused to obey, and the trial of the Seven Bishops and their acquittal by a jury followed. An invitation was thereupon sent to William of Orange to become King.

Industrial Psychology. Industrial psychology is the application of the principles of psychology to industry with a view to increased production on the one hand and increased well-being of the worker on the other. Although such an attitude must have existed in a general way for many centuries, the first important experiments in this field were carried out by an American, Frederick Winslow Taylor (known by his associates as "Speedy" Taylor). Born in Philadelphia of Quaker stock at the end of last century, Taylor became chief engineer at the Midvale Iron Works, where he soon became convinced that the traditional ways of doing things were often inefficient. His working principles were: (1) To employ only the best workers. (2) To discover by experiment the simplest motions for carrying out a given job. (3) To stimulate incentive by giving a higher wage for higher production. In this way he was able to raise the amount of iron handled by a worker from 12½ tons a day to 47½ tons. Since then, most industrial psychologists have concerned themselves: (1) with the study of individual differences—finding the worker most suited to the job, and (2) studies of fatigue and the effect of improved lighting, heating, etc., on the worker—*i.e.*, the betterment of working conditions. Prof. Mayo, however, showed at Chicago in 1938 that *what* was done to help the worker was often less important than *how* it

was done, that a happy and satisfied working group did better work than one based on purely technical conditions of efficiency. Today people often blame mass-production methods in industry for making work dull, frustrating, and uninteresting; but this is not the reason for industrial frustration at all. It is rather that workers have not been treated as intelligent beings who need to know *what* they are doing, *why* they are doing it, and to *what* end. Work is frustrating, not in terms of what it actually is, but in terms of what it means, or does not mean, and what is frustrating about the industrial situation is not that it implies dull work or hard work or work under bad conditions, but that it often seems to imply meaningless work. One of the greatest discoveries of 20th century medicine has been the rediscovery of the patient. This is of importance because its significance extends far beyond the bounds of medicine into psychology, sociology, and all the social sciences. *See also* **P5 6**.

Inertia, a term used in mechanics for the property of matter by which it offers resistance to a change in its state of rest or in its state or direction of motion.

Inertial Navigation, an automatic method of dead-reckoning which at present finds its chief application in guided missiles, submarines, and aircraft. Navigation by this means is carried out with reference to inertial space (*i.e.*, space which is stationary with respect to the fixed stars) and not to the surface of the earth as in normal navigation (latitude and longitude). This is done by means of high-accuracy gyroscopes combined with highly sensitive accelerators in an apparatus known as the Ship's Inertial Navigation System. The American nuclear-powered submarine *Nautilus* pioneered the new north-west passage under the polar ice pack by this method of dead-reckoning in Aug. 1958.

Inescutcheon, a small scutcheon borne heraldically within the shield of ordinary dimensions.

Infallibility, the Roman Catholic doctrine that accords the Pope divine immunity from error, in the execution of all that pertains to his pontifical functions. It was first proclaimed as dogma of the Church by the Vatican Council in 1870.

Infante was the title of any son but the eldest of the king or queen of Spain or Portugal. *Infanta* was similarly the title of any daughter except one that might be heiress to the throne.

Infantry, the portion of an army which consists of foot soldiers equipped with "small arms."

Inflorescence, a cluster of flowers upon a shoot. Many arrangements of the flowers are possible and there are many kinds of inflorescence; *e.g.*, the spike, catkin, umbel, capitulum (in composites).

Infra-Red Rays *or* **Radiation**. This is the range of rays which come between the visible red rays and the ultra-short Hertzian radiation. The wave-lengths involved range from about 0·00076 millimetre (7,600 Angstrom units) to 0·4 millimetre. Infra-red rays penetrate haze; hence landscapes obscured by haze or cloud can be photographed using plates sensitive to infra-red. Many substances strongly absorb these rays and thereby become hot; this happens in toasting bread. Many industries use infra-red lamps for drying paints and lacquers.

Infula, a sacred fillet, of woollen material, worn on the head by priests anciently, and by magistrates and rulers on solemn occasions, also by persons fleeing for protection to sanctuary. The infula later became a pendant to the mitre of bishops.

Ingoldsby Legends, a series of whimsical metrical tales full of droll humour written by the Rev. R. H. Barham, and first published in *Bentley's Miscellany* in 1837.

Ink, a liquid pigment ordinarily made from an infusion of nut-galls, copperas, and gum arabic. Shumac is substituted for nut-galls for inferior inks. An acid is sometimes added to prevent oxidation, and for the blue-black inks a small quantity of solution of indigo serves for colouring. Copying ink contains glycerine or sugar, which keeps the ink moist. Lampblack used to be the leading ingredient in printer's ink but now new methods of manufacturing have been developed. Marking ink is composed of a solution of nitrate of silver, gum, ammonia, and carbonate of soda. For red, blue, and other coloured inks, colouring solutions are used. The earliest examples of ink writing (on wooden tablets) ever found in Britain were recovered from the well of a Roman villa (3rd century A.D.) during excavations in 1954 at Chew Stoke, Somerset.

Ink Sac, a glandular organ found in squids and other cephalopods which contains an inky solution. When roused the animal discharges the contents of the ink sac into the water, to make a cloud through which its enemies cannot see. The pigment, sepia, comes from the ink sac of the cuttlefish.

Inlaying is the introduction of one class of substance into another in some artistic or other design, such as silver let into zinc, copper, or lead, and called *bidri*; the insertion of gold and silver into iron or steel, which is *damascening*; the mingling of brass with tortoiseshell, *buhl work*; the inlaying of woods, *marquetry*; of stone, *pietra dura*; and of the arrangement of small pieces of stone, for floors, walls, etc., *mosaic*.

Innocents' Day, a festival day in Roman, Greek, and Anglican Churches in commemoration of the killing of the children of Bethlehem by Herod, Dec. 28.

Inns of Court, the four bodies in London which enjoy the privilege of calling candidates to the bar after they have studied for a certain number of terms and passed certain examinations. The Inns are: the Inner Temple, the Middle Temple, Lincoln's Inn, and Gray's Inn.

Inquisition, a Roman Catholic ecclesiastical court which became a formidable weapon of the Church in the 13th century under Pope Innocent III. in dealing with charges of heresy. It was effectively set up in the various Catholic countries of the Continent, obtaining its fullest and most sweeping organisation in Spain in the days of Ferdinand and Isabella, when Torquemada was made Grand Inquisitor, and used its powers with terrible severity. (*See* **Auto-da-fé**.) In the 18th century its influence began to wane, and although the Congregation of the Holy Office still exists at Rome, its jurisdiction is limited to the suppression of heretical literature.

Insectivora are mammals which live almost exclusively on insects and worms. This mammalian order comprises hedgehogs, moles, shrews, etc.

Insectivorous Plants, a group of flowering plants found in all parts of the world which by means of special mechanisms entrap insects; enzymes in the plant enable the insects to be digested. The most common British species are the Sundew and the Bladderwort.

Insects. This huge class of invertebrate animals includes about 700,000 species. Insects are ubiquitous except in the sea, only a very few species being adapted to marine existence. Characteristic features are: the body is divided into three parts, head, thorax, and abdomen; the head carries a pair of antennæ, the thorax three pairs of legs, and usually two pairs of wings. The most primitive insects constituting the sub-class *Apterygota* are wingless. The other sub-class, *Pterygota*, is divided into the *Exopterygota* (*Hemimetabola*), which have a simple metamorphosis; and the *Endopterygota* (*Holometabola*), with a complex metamorphosis. The fifteen orders of the *Exopterygota* are: *Orthoptera, Isoptera, Plecoptera, Embioptera, Dermaptera, Ephemoptera, Odonata, Psocoptera, Anoplura, Thysanoptera, Hemiptera*. The *Endopterygota* comprises nine orders: *Neuroptera, Mecoptera, Trichoptera, Lepidoptera, Coleoptera, Strepsiptera, Hymenoptera, Diptera, Aphaniptera*.

Insignia, marks or badges of office or honour, such as stars, ribbons, crosses, medallions or other designating objects, worn by members of special Orders or holders of prominent offices.

Institut de France was formed in 1795, and after various modifications was in 1832 organised on its present basis. Its five academies are—the Académie Française, Académie des Inscriptions et Belles-Lettres, Académie des Sciences, Académie des Beaux-Arts, Académie des Sciences Morales et Politiques. It is restricted to 40 members.

Instruments, Musical. Musical instruments may be classified in a number of ways, but in general they fall into one of the three main classes, String, Wind, and Percussion, according to how the sound is produced. **Stringed Instruments** are those which produce the sound by the vibration of a string: (*a*) by plucking, as in Harp, Lyre, Psaltery, Zither, Lute, Guitar, Balalaika, Ukelele, Harpsichord; (*b*) by friction (bowed), as in Crwth, Rebec, Viol, Violin, Marine Trumpet, Hurdy-Gurdy; (*c*) by striking (hammered), as in Dulcimer, Pianoforte, Clavichord; (*d*) by wind (blown), as in the Aeolian Harp. **Wind Instruments** are those in which the air in the instruments is set in vibration: (*a*) by blowing into a tube (flue-voiced), as in Recorder, Pandean Pipe, Flute, Organ; (*b*) by means of reeds (reed-voiced), as in Oboe, Clarinet, Saxophone, Bagpipe, Cor Anglais, Bassoon, Organ reed-stops; (*c*) those in which the sound is produced by the vibration of the player's lips against the mouthpiece (lip-voiced), as in Bugle, Horn, Trumpet, Tuba, Trombone, Saxhorn, Flügelhorn, Cornet. In a modern orchestra these are known as the *Brass*: instruments of the flute, oboe, and clarinet families as the *Woodwinds*. Then there are the **Percussion Instruments**, which include the Drums, Cymbals, Tambourines, Castenets.

Insulation, the condition in which an electrified body is prevented from communicating electricity to contiguous bodies by the interposition of a non-conducting material. Glass, shellac, ebonite, and gutta-percha are all non-conductors, and wires obtain insulation by wrappings of cotton or silk.

Insulin, the hormone secreted by the islet tissue of the pancreas, from which it was isolated in 1922 by Banting and Best. Dr. F. Sanger of Cambridge University was awarded the 1958 Nobel Prize for his work in determining the chemical structure of insulin. *See* **P39** (1), **50** (1).

Intaglio, engraving or carving on a sunken ground, a method frequently adopted in the ornamentation of stones and rings.

Intelligence. Intelligence has been variously defined as "the ability to see the relationships between things" and "the ability to profit from experience." The idea of intelligence testing was first devised by the French psychologist Binet at the beginning of this century. He was asked by the French government to invent a test which would weed out backward children in state schools, and thus save public money and avoid holding back the work of the class by teaching children who were incapable of learning at a given standard. Binet solved the problem by giving a large series of practical questions and finding how many could be solved by the majority of children in a particular age-group. The questions were arranged so that in one group the majority of problems could be solved by most children of ten, in another by most children of twelve, and so on. If a child of thirteen could solve correctly only those problems devised for a child of ten, his Mental Age was said to be ten, and his Intelligence Quotient was 10/13 multiplied by 100, of roughly 77%. His intelligence, in other words, was only 77% of the normal. More modern intelligence tests have been devised which to some extent discount the influence of learning, since "intelligence" refers to innate ability—the capacity to learn rather than learning itself. The following facts have been discovered about intelligence: (1) Men and women do not differ in average intelligence. (2) Different races do not vary in average intelligence. (3) Delinquents are more often of lower intelligence than others. (4) Intelligence is inborn, and does not increase after age 14. *See also* **F43**.

Interdict, a Roman Catholic ecclesiastical prohibition, directed either against a country, community, or Church, or against persons. It is a weapon that is now rarely used, but in former times was often exercised with great power and severity.

Interlude, any short stage piece, or brief musical composition, for performances between more important pieces. In the strict musical sense an interlude is an *instrumental* composition played between the acts.

International Date Line, a line along the 180° meridian, marking the difference in time between E. and W. For the westward-bound traveller crossing the line the date would be put forward one day, for the eastward-bound, back one day. To avoid difference of date in adjacent land areas, the line deviates from the 180° meridian where this crosses land.

Interval, in music indicates the differences in pitch between two notes. This is often expressed numerically. Thus the interval between C and the E above it is a major third, that between C and E flat is a minor third, that between C and G is a fifth, that between C and A is a sixth, and so on.

Introit, the psalm or hymn in common use in the Anglican Church, which is sung as the clergy enter the church to commence the divine service of Holy Eucharist.

Invention of the Cross, a Roman Catholic festival, held on May 3 to celebrate the finding of the alleged True Cross at Calvary by the Empress St. Helena in 326. Also included in the Church of England calendar. (*See* **Holy Rood.**)

Invertebrata, the primary division of the animal kingdom used to be into vertebrates—animals with backbones—and the invertebrates. This classification is now obsolete (*see* **Animal Kingdom**), and the Invertebrata is now defined as the portion of the animal kingdom containing all but the phylum Chordata. *See* **F23**.

Investiture, the ceremony of conferring honour, office, or possession—the investment of the recipient with badge, token, or public recognition.

Invultuation, a form of magic or witchcraft that prevailed in olden times, consisting of pricking a wax or clay image of a person whose death was desired, invoking simultaneously the aid of evil spirits, the belief being that the spell would have a fatal effect.

Iodine, a substance formerly exclusively obtained from the ribbon-wrack seaweeds. These were burnt and the ashes (kelp) extracted with water. After concentrating the iodides, these were distilled with manganese dioxide and sulphuric acid to yield iodine vapour which was condensed in stoneware bottles. Nearly all iodine now in use is derived from the iodine salt present in Chili saltpetre (sodium nitrate). Iodine is used in photography, as an antiseptic solution in alcohol or potassium iodide (tincture of iodine), and in medicine. Courtois discovered iodine in 1812.

Ions, atoms which are no longer electrically neutral but either positive or negative according to whether they have lost or gained electrons (**F11** (2)). Thus, the hydrogen atom without its electron is a hydrogen ion or *proton* and the helium atom without its two electrons is a helium ion or *alpha-particle*. When an electric force is applied to certain solutions, the ions into which molecules of the dissolved substance are broken up are attracted to the oppositely charged electrodes, their movements constituting an electric current through the solution. In the same way gases, including air, conduct electricity by virtue of free ions (*see* **F46** (1). Combustion, radioactivity, and ultra-violet and cosmic radiations produce ionisation.

Ionic Order of architecture is one of the five classic orders, its leading characteristics being the volute of its capital, which has on each side distinctive curved or scrolled ends.

Ionosphere, the atmospheric region which lies between about 60 m. and about 300 m. above the surface of the Earth. The air in this region is a partial conductor of electricity, a property imparted to it by the action of the sun. The ionosphere is divisible into several layers, each with distinctive properties. The Heaviside layer, named after Oliver Heaviside who postulated its existence on theoretical grounds in 1892, reflects long radio waves. The higher Appleton layer, known after its discoverer, Sir Edward Appleton, reflects short radio waves. *See* **X3**, **F46** (1), **48** (2).

Ipecacuanha, a flowering plant of the madder family, a native of the Brazilian forests.

Iridium, a white and very hard metal discovered by Tennant in 1804. It occurs naturally as an alloy with platinum or osmium; tips for fountain-pen nibs have been made from the former native alloy. The standard metre is

composed of platinum-iridium alloy, as are parts of scientific apparatus and surgical tools that must be non-corrodible.

Iris, the typical genus of the botanical order *Iridaceæ*, with tuberous rhizomes and sword-shaped leaves, many of the family having beautiful flowers. About 100 species of Iris are recorded from the northern temperate zone, but only two species occur wild in Britain—the yellow flag and the gladdon. Orris root, used in perfumery, comes from another iris species.

Irish Moss, a kind of seaweed (*Chondrus*) found on certain parts of the Irish coast, and collected, dried, and bleached for use as cattle food or for making a nutritious jelly.

Iron is extracted by smelting from different ores, hæmatite, magnetic iron, and spathic iron, coal or coke being now universally used for smelting purposes. The kinds of iron produced are cast iron and wrought iron. Alloys of iron are called steels.

Iron Age, the period when primitive man made and used weapons and implements made from iron. It came after the Stone and the Bronze Ages.

Ironclads, ships of war cased in iron or steel plates of sufficient thickness to resist projectiles. They were first introduced (1858) in the French Navy, and in 1860 the first British ironclad, the *Warrior*, was launched.

Iron Cross, a Prussian order instituted in 1813 for distinguished services in war.

Iron Crown, the crown of the ancient kings of Lombardy and emperors of Germany, and noted for its iron band, said to have been forged from one of the nails of Christ's cross. Napoleon I. insisted on being crowned with it, and in 1866 it was presented to Victor Emmanuel at Turin.

Iron Curtain. In a speech at Fulton, U.S.A., on March 5, 1946, Sir Winston Churchill used this phrase to describe the dividing line behind which, he said, lie all the capitals of the ancient States of Central and Eastern Europe—Warsaw, Berlin, Prague, Vienna, Budapest, Belgrade, Bucarest, and Sofia. These famous cities and the populations around them, said Sir Winston, lie in the Soviet sphere and are subject "to a very high and increasing measure of control from Moscow."

Ironsides were Cromwell's special troopers, so called because of their solidity and firmness in battle.

Irredentists, a political party organised in Italy about 1878 with the object of incorporating with Italy neighbouring regions. Also a person, group, or party advocating policies for the restoration to their country of territory formerly belonging to it but later lost.

Irrigation, an artificial method of providing water for the growth of plants on lands where the natural supply of water is deficient. The science has made immense progress during the last fifty years, and has been the means of bringing into profitable cultivation vast tracts of territory in India and Western America which had previously been arid wastes. The systems are various and are utilised according to the special conditions of the land to be irrigated, but the success which has attended these experiments has been very gratifying. In fact, irrigated lands are often more productive than lands which receive a fair amount of moisture from the elements; the irrigation supply can be distributed and regulated exactly according to requirements. Irrigation also serves the purpose of supplying *warmth* in winter; *e.g.*, in the English water-meadows, and in the more highly developed Italian *marcite* and winter-meadows, where the water is mostly applied in winter when there is plenty of rain. There are several other functions of irrigation; *e.g.*, washing out of excess salts.

Isinglass, a gelatinous substance manufactured from the swim bladders of certain fish, the best kinds coming from Russia and Brazil. Coarser varieties are made from hides.

Islam, the religion of which Mohammed was the prophet, the word signifying submission to the will of God. An adherent of Islam is called a Moslem or Muslim. It is one of the most widespread of religions; its sacred book is the Koran.

Isobars are the lines drawn on charts linking together points of equal barometric pressure.

Isolationists, the body of opinion in the United States advocating non-interference in European affairs. Its strength has much declined in the light of contemporary events.

Isopoda, the crustacean order to which the wood-lice belong.

Isotherms are lines drawn on charts through points of equal temperature.

Isotopes. When one talks of an element, say, uranium or lead, the name of the element is a generic name for a collection of uranium species and lead species. The different species are called isotopes. For any particular element, the number and arrangement of electrons around the nucleus are the same in all the isotopes, so all the isotopes have the same chemical properties. Soddy has described isotopes as "elements, the atoms of which have similar outsides but different insides." For example, in the nucleus of the uranium isotopes, U 235, U 238, and U 239, there are respectively 143, 146, and 147 neutrons. The isotopes have different atomic weights, in this instance respectively 235, 238, and 239. Britain is the largest exporter in the world of radioactive isotopes. *See* **F10** (**2**), **60** (1).

Isthmian Games were held in alternate years by the ancient Greeks on the Isthmus of Corinth, in honour of Neptune, and were of the same class as the Olympian Games. Wreaths were the only prizes.

Itch-mite, a minute mite which burrows beneath the skin and produces scabies.

Ivory, the dentine substance of which the tusks of the elephant, hippopotamus, walrus, etc., are composed. The tusks of the African elephant sometimes weigh as much as 100 lb., and reach a length of 8 or 9 ft.

Ivory Gull, a small, beautifully shaped sea-bird with striking all-white plumage and black legs which breeds on the rocky shores of the Arctic, being found farther north than any other bird; it occasionally wanders south in the winter.

Ivy, the well-known climbing shrub, chiefly evergreen; furnishing a sudorific, the berries having also emetic properties.

J

Jabiru, the Brazilian name for the giant stork of South America.

Jacamar, from *Jacameri*, the Brazilian name for a smallish bird with long, sharply pointed bill and brilliant plumage which inhabits the tropical regions of South America east of the Andes. These birds are seen sitting motionless on trees, darting off at intervals to catch insects on the wing.

Jacana, a tropical bird (the water-hen of Brazil and the warmer parts of America) of wide range, beautiful of plumage, with slim body and narrow wings, and long, pointed beak. It feeds on seeds and insects, inhabits marshy lands, and is related to the plovers.

Jack, a small schooner-rigged vessel, used in the Newfoundland fisheries; a pike; an oscillating lever; a device used in roasting meat.

Jackal, a small wild dog related to the wolf and resembling a fox. The Common Jackal is found in S.E. Europe, India, and Ceylon; other species inhabit Africa and Egypt. The jackal is a well-known scavenger.

Jackdaw, one of the smaller members of the Crow family. This European bird is typically black with grey collar. It is easily tamed, makes an amusing pet, and delights in making off with and taking to its nest bright objects, such as silverware.

Jack Ketch, a by-name for the common hangman, and said to have been the real name of the public executioner of the time of James II.

Jacobins, a French revolutionary club or party, formed in 1789, and accustomed to meet at a Jacobin convent, hence the name. It became a controlling force in the Revolution, especially in the movement which led to the Terror. Robespierre was its chief spokesman.

Jacobites, adherents of the Stuart cause after the abdication of James II. First James himself, then his son (the Old Pretender), and later his grandson (the Young Pretender) tried to fan the flame of rebellion in Scotland and Ireland, but after the defeat at Culloden in 1746 the cause was lost.

Jacquerie, a revolt of French peasants in 1358 against the tyranny of the nobles. So named from the contemptuous title, "Jacques Bonhomme," given by the nobles to the peasantry.

Jade, a green mineral found in China, America, and New Zealand, and used for making vases, bracelets, and other ornamental articles. There are many varieties, and there is evidence that the stone was in common use in prehistoric times for weapons and utensils.

Jaggernaut, or **Juggernaut**, the name of the great Indian idol at Puri, which once a year is brought forth from its temple, placed on an enormous car, and conveyed at the head of a mighty procession through the streets. Multitudes of pilgrims assemble on these occasions, and it used to be the practice for many fanatics to throw themselves beneath the wheels of the car and allow themselves to be crushed to death.

Jaguar, a South American carnivorous animal resembling the leopard, but much larger and more powerful.

Jains, a religious community in India numbering about 1,500,000. Jainism, which arose rather earlier than Buddhism in revolt against Hinduism, is based on *ahimsa*, non-injury to all living things; wealth and possessions are discarded. The founder was Mahavira, born *c.* 599 B.C. The Jain temples are among the most beautiful in India.

Jamb. the upright sides of a door, window, fireplace, or other aperture, supporting the lintel, entablature, or mantel and shelf.

Janeite, a devotee of Jane Austen and her writings.

Jangada, a rude sort of boat or catamaran carrying a large sail, used off the coasts of South America.

Janissaries, a former band of Turkish foot soldiers who acted as the Sultan's bodyguard, and were noted for their turbulence and cruelty. They existed from the 14th century to 1826, when they were finally disbanded after the people had risen against them and massacred many thousands.

January, the first month of the year, named after Janus, the two-faced god of the Romans. It was the *Wolf monath* and *Aefter Yule* of the Saxons.

Jarrah Wood, the wood of the mahogany gum tree of Western Australia, one of the hardest of all woods.

Jasmine, a graceful climber belonging to the olive family with odoriferous blossom, originally a Persian plant, but now acclimatised in many varieties in almost all parts of the world. Two species of jasmine (the common jasmine and the Spanish jasmine) yield oils used in perfumery.

Jasper, a precious stone of the chalcedony variety, opaque, and coloured red, brown, yellow and sometimes green. It was greatly esteemed by the ancients, the Bible having numerous allusions to it.

Jaunting Car was a two-wheeled vehicle peculiar to Ireland, containing a lengthwise seat on each side and a seat in front for the driver.

Javelin, a spear thrown by hand and one of the common weapons of war from the days of ancient Rome to the Middle Ages. Today, athletic field events include the javelin throw.

Jay, a gaily-coloured bird of the Crow family, of many species—the Blue jay of N. America, the Canada jay, sometimes called "whisky jack," the Siberian jay, and the British jay, fawn-coloured with black and whitish crest and bright blue feathers in the wings. It lives in woods and like the magpie, takes the eggs and young of small nesting birds.

Jazerine, an antique military or protective jacket, strengthened by small overlapping pieces of steel or other metal internally, worn generally by the Italian nobility during the Middle Ages.

Jazz, a rhythmical syncopated music probably originating among the Negro population of the Southern States of the U.S.A. It became popular during the first world war and, in a commercialised form, has held the popular field ever since. Modern dance music and popular songs are based on the jazz idiom, which has also had a profound effect upon contemporary music of a more serious kind.

Jean, a stout kind of twilled cotton cloth much worn in olden times, and resembling fustian. Blue *jeans*, adopted by American city youngsters from farmworkers, are now the fashion elsewhere and worn not only as overalls by workmen but by both sexes in leisure time.

Jebusites, are often referred to in the Old Testament. They were a Canaanite nation, who held Mount Zion, and were in frequent conflict with the Israelites, until finally defeated by David.

Jehovah, one of the Hebrew names of the Deity, the etymology of which is obscure. The English translators of the Old Testament rendered it "the Lord." The Jews, however, regard the word as too sacred for speech, and use the equivalents *Adonai* or *Elohim* instead of it.

Jelly-fish. The jelly-fishes, which have gelatinous bodies fringed at the margin with delicate tentacles, constitute the coelenterate order *Scyphozoa*. The mouth, with a squarish opening, is seen on the underside, and there are four horseshoe-shaped sex organs.

Jenny, the name given by James Hargreaves to the spinner frame invented by him in 1766, which greatly improved and extended cotton-spinning operations.

Jerboa, small jumping mammals of the Rodent order. These mice-like animals have long tufted tails and very long hind legs, the front legs not being used for locomotion. The African jerboas have three toes, the Asiatic jerboas five.

Jereed, a wooden javelin, used in Turkey and Persia in tourneys and marksmanship competitions. It is about five feet long, and great skill may be attained in flinging it at a moving object or fixed target.

Jeremiad, any utterance or writing in which sorrow or complaint is the chief characteristic, so named as recalling the style of the "Lamentations of Jeremiah," in the Old Testament.

Jerusalem Chamber, a room in Westminster Abbey, deriving its name from the circumstance of its having originally been decorated with a view of Jerusalem. Henry IV. died in this chamber, and the Committee for the Revision of the Bible met there in 1870 and later.

Jesuits, members of the Roman Catholic teaching order founded by Ignatius Loyola in 1534. The education of the young and of society itself was an important part of their programme. A long and vigorous course of study is prescribed before they are admitted into the privileges of full membership. They are required to take the vows of voluntary poverty, perfect chastity, perfect obedience, and complete submission to the Pope. The Society played an important part in politics.

Jet, a deep black fossil substance admitting of a high polish and much used for jewellery, ornaments, and trimming. It is a form of lignite, the most important British deposit being found near Whitby, where jet manufacture has been an established industry for a long period.

Jet Engine, an aeroplane engine which derives its thrust from the high velocity of the gases it ejects. The essential units in a jet engine are a rotary compressor and a gas turbine, the latter driving the compressor. The first reliable, high-performance jet propulsion engine for aircraft was invented by Air Commodore Sir Frank Whittle.

Jetton, a kind of metal counter formerly used in card-playing. Examples survive in many museums.

Jet Stream, a meteorological term coined in 1946 to describe the relatively narrow belt of strong winds (100–200 m.p.h.) at levels in the atmosphere from 3 to 7 miles. These winds are important in forecasting weather, and can be a valuable aid to aircraft. From the ground, where there may be little wind, the jet stream can sometimes be seen as high cirrus cloud moving across the sky at high speed.

Jewish Calendar is supposed to date from the Creation, which according to their reckoning occurred on Oct. 7, 3761 B.C.

Jews, descendants of the ancient Hebrews or Israelites, who settled in what is now called Palestine about the 15th century B.C. Before the Nazi persecutions and massacres—the greatest tragedy of Jewish history—world Jewry numbered over 15 million. About 5 million lived in the United States and 10 million in Europe (Poland 3 million, Russia 3 million, Central Europe 2 million, Germany 500,000, England 300,000, France 170,000, Holland

120,000). Some 6 million Jews perished in the course of the Nazi persecutions. A movement to restore Jews to Palestine was founded in 1897, known as the Zionist movement (*q.v.*). From 1923, when the Treaty of Lausanne formally ended the war between the Allied Powers and the Ottoman Empire, until 1948, Palestine was administered by Great Britain under a mandate. Efforts to reconcile Jews and Arabs proved unsuccessful and Great Britain in 1946 decided to submit the problem to the United Nations for solution and terminated the mandate on May 13, 1948, when the Jewish National Council proclaimed a Jewish State of Israel. When the Israeli state was created the population was about 650,000 Jews and 1 million Arabs. In 1951 the population figure was 1,578,000 (90 per cent. Jews). (*See* **Anti-Semitism.**)

Jew's Harp. The name is believed to be a corruption of "jaws harp." This instrument consists of a metal frame with a central tongue of spring steel. The frame is pressed against the teeth, and the tongue of the harp is twanged with the finger, the mouth acting as a resonating chamber. By altering the shape of the mouth the resonant frequency and therefore the note can be varied.

Jib, the front triangular sail of a ship, resting on a stay, and in large vessels projecting from the end of the jib-boom. There is also a flying jib outside this.

Jig, a rapid dance for one or more persons, much indulged in in Ireland and the English and Scottish provinces, a survival of old English days.

Jihad, a religious war of Mohammedans against unbelievers. Fanatics attempted to set one on foot in India in 1877, and simultaneously another was proclaimed at Constantinople against the Russians, but it came to naught.

Jimson Weed, corruption of Jamestown Weed, a synonym for the Thorn Apple.

"**Jingos**," an English political term which came into vogue in the "seventies" and "eighties," when Russia seemed to be threatening an advance on Constantinople. A music-hall song of the day, sung by Macdermott, the refrain of which was "We don't want to fight, but by *jingo* if we do," etc., emphasised the feeling of the party and gave the cue for their being called "Jingos"

Jinnees are supposed to be spirits of evil, assuming various shapes, human and animal, and exercising good or evil influence, according to their origin or mission. In the *Arabian Nights* and other Eastern literature Jinnees or genii are numerous.

Jinriksha, a hooded, two-wheeled vehicle drawn by one or two men, and used in Japan, India, and other Eastern countries.

Joachimites were adherents of the Italian religionist Joachim, who was abbot of San Giovanni del Fiore at the beginning of the 13th century, and maintained that three reigns would complete the history of the earth; the first was the reign of the Father, from the Creation to the birth of Christ; the second that of the Son, from the birth of Christ to 1260; and the third that of the Holy Spirit, from 1260 to the end of the world.

Jockey Club, the governing body that, although possessing no legal status, frames rules and laws by which horse-racing and turf matters generally are regulated. The club-house is at Newmarket.

John Bull, the typical figure of an Englishman, bluff, big, and burly. Arbuthnot's *History of John Bull* is supposed to have originated the character.

John Company, a familiar appellation of the East India Company.

John Dory, a well-known sea-fish of which there are six species. It is of a golden-yellow colour (*jaune doré*), has a high dorsal fin with long filaments projecting from the spines, and is much valued as a table fish. It is sometimes found in British waters, but the Mediterranean is its chief habitat.

John o' Groat's House, W. of Duncansby Head, Caithness, popularly named as the northernmost point of Scotland. According to legend the house, which has now disappeared, was built in octagonal form by a Dutchman Jan de Groot who came to live there in the 16th century. The site is marked and an inn was erected near it in 1876.

Jongleurs were minstrels and jesters who wandered from town to town singing songs and giving entertainments in mediæval France and Norman England. *See* **G39 (1)**.

Joss, the popular name of a Chinese idol, the place where it is kept being called a joss-house.

Jougs, an ancient Scottish instrument of punishment, in the form of an iron collar, which was fitted to the neck and held to the wall or to a tree by a chain; a variety of pillory of a barbarous character, employed at times in the repression of female recalcitrants.

Joule, a unit of energy equal to 10^7 ergs, or about $\frac{3}{4}$ of a foot-pound. Named after the British scientist, J. P. Joule (1818–89). It may be defined as the work done in one second in maintaining a current of one ampere against a resistance of one ohm.

Jousts were military tiltings in the nature of tournaments, where the contestants strove against each other on horseback with blunted lances. It was the sport of nobles in feudal times.

Jowter, a Cornish and West of England term for a fish-hawker who plies his trade on horseback.

Jube, in church architecture, the rood-loft over the entrance to the choir from the chancel.

Jubilee (or **Jubile**), the year following the seventh seven-year period. A year of perfect rest (Lev. xxv). In the Roman Catholic Church the Jubilee Year is every 25th year from Christmas to Christmas (originally 100 years), during which time plenary indulgence is obtainable. Introduced by Boniface VIII. Feb. 22, 1300. In recent years the word Jubilee has been applied to any form of 50th year celebration.

Judge Advocate General is an officer whose duty it is to advise the Crown on Courts Martial and on subjects connected with military law.

Julian Calendar, named after Julius Cæsar, who in 46 B.C., finding the Roman year 90 days in advance of the real time, was the first to adopt the calculation of time by the solar year, the average length being fixed at 365¼ days. There was still an overplus of a few minutes every year, and this was rectified by the Gregorian Calendar, introduced in Italy in 1582 and adopted in England in 1752, from which date what is called the "New Style" begins.

Julus, a genus of millipedes with cylindrical bodies and two pairs of legs to each segment, the latter being 40 to 50 in number. In South America specimens 5 or 6 in. long are frequent, but those found in England are small.

July, the seventh month of the year, named after Julius Cæsar. It was the *Maed monath* (Mead-month) of the Saxons.

July Revolution, the French revolution of 1830 whereby Charles X. was deposed and Louis Philippe made king. The latter was deposed by the revolution of 1848.

Jumart, a fabulous monster which often cropped up in early English literature, supposed to be the offspring of a bull and a mare, or of a horse and a cow.

Junco, the name given to a genus of snowbirds, confined to the American continent.

June, the sixth month of the year, containing 30 days and deriving its name from Juno. It was the *Sear* (Dry) *monath* of the Saxons.

Jungle-Fowl, birds related to the peacocks and peacock-pheasants. At least four species are known from the jungles of India, Ceylon, and Java. The domestic chicken has been derived from the Red Jungle-Fowl (*Gallus bankiva*).

Juniper, the Nova Scotian name of the American larch; also all the trees of the *Juniperus* genus; from the unripe fruit of some species of which is distilled the stimulant and diuretic oil of juniper.

Junk, a flat-bottomed Chinese sea-going boat, carrying large masts, and employed on the coasts and seas of China and Japan.

Junkers, name of the ruling class of Prussia, military in spirit, who were the party of reaction and defenders of the landed interests. Supported Bismark prior to the Franco-Prussian war and helped bring Hitler to power. They have been expropriated and broken.

Junket, a sort of sweetmeat, consisting sometimes

(as in Devonshire) of curds and cream, sweetened and flavoured at will, made with rennet.

Junta, a Spanish word designating a legislative or other distinguished assembly entrusted with the passing of laws or the deciding of policy. A grand council of state.

Jupiter, the largest body of the planetary system except the sun, from which orb it is distant 483 million miles. Its mass is over 300 times that of the earth, while in bulk it is 1,300 times as large. It has 4 major (discovered by Galileo in 1610) and 7 minor satellites, the former being visible with field glasses. Also the supreme deity of the Romans, identified with the Greek Zeus.

Jurassic Formation, a series of rocks (the evidences of which are most marked in the Jura Mountains) coming between the Cretaceous and Triassic groups and including the Oolite and the Lias. It is a formation rich in fauna, abounding in echinoids, lamellibranchs, ammonites, and belemnites; large reptiles, marine and land, are common, as are the plants called cyads. In Britain the Jurassic outcrop extends from the Dorset coast to the Yorkshire moors.

Jury, a body of men chosen and sworn to hear and pass verdict upon evidence brought forward at a trial, inquest, or inquiry. Its origin is obscure, but it was in existence in the 13th century. The trial jury consists of twelve jurors, except in the county court, where small civil cases are sometimes tried by the judge and a jury of five. The jurors are the judges of fact upon the evidence laid before them. Since the passing of the Sex Disqualification (Removal) Act, 1919, women may serve as jurors throughout the United Kingdom.

Jurymast, a word of doubtful origin, but indicating an improvised mast put up in place of one lost or broken.

Jute, the name given to the fibre of a plant grown largely in Pakistan in the Ganges delta and used for the manufacture of coarse cloths, cordage, etc. Calcutta is the biggest jute-manufacturing centre of the world, as Dundee was in the 19th century.

Jutes, a Low German race who in the 5th century invaded the south-eastern part of England, establishing themselves in Kent and making Canterbury their capital.

Juvenalia, games of young people instituted in Rome's imperial days by Nero.

K

Kaaba, the inner shrine of the Great Mosque at Mecca, only thrown open to the faithful three times a year. It contains in its south-eastern corner the famous sacred "black stone," said to have fallen from heaven with Adam.

Kaffirs, Bantu-speaking negro tribes of the Union of South Africa, whose occupations are cattle-raising, farming, and hunting.

Kago, a rude Japanese palanquin suspended from a pole borne on the shoulders of two carriers, the person carried resting in a sort of bamboo hammock.

Kagu, native name for a curious bird related to the sun-bittern and the only member of the Rhinochetinæ family, found inhabiting New Caledonia when that island was colonised by the French.

Kain, a tribute or duty formerly taken—in kind, as poultry, etc.—by landlords in Scotland and elsewhere as part of the rents due to them from their tenants.

Kaiser, the German form of the word Cæsar, emperor, borne up to 1918 by the then sovereigns of Germany and Austria. Charlemagne was the first prince to assume the title of Kaiser.

Kakapo, the Maori name for the New Zealand owl-parrot, a peculiar and interesting species, possessing wings but not able to use them for flight, of brown mottled plumage, nocturnal in its habits, and nesting in burrows. The bird, once abundant, is rapidly becoming extinct.

Kalan, a local name for the sea-otter which is only found in the seas of Kamchatka and North-West America. It is larger than the beaver, and weighs from 70 to 80 lb.

Kalmuks, a branch of the Tartar or Mongol race who in the 17th century migrated to Europe. Many of them returned to China in 1771. The descendants of the last of these nomads to enter S.E. Russia are now organised as the Kalmyk Autonomous Soviet Socialist Republic.

Kalpis, an ancient three-handled Grecian water vase of large size, decorated with classical figures in red on a dark ground.

Kangaroo, pouched (marsupial) mammals of Australia and adjacent islands. There are over 20 species, the smaller ones being known as "wallabies." Kangaroos leap in a succession of springy bounds 10–20 ft. long, the forefeet not touching the ground. They can reach a height of over 6 ft. and a weight of 200 lb. First seen by white men when Capt. Cook's expedition visited Australia in 1770. Related genera include the tree kangaroos, rat kangaroos, and the Tasmanian Jerboa kangaroo.

Kaolin *or* **Kaolinite**, a fine clay much used in the manufacture of high-class pottery. It results from the decomposition of felspar, and is found in China, Japan, Devon, Cornwall, at Limoges, and in certain parts of the United States.

Karma, the Buddhist theory that a man's actions control his destiny after death, as the natural effect of a natural cause. The idea of successive existences is bound up with the doctrine, and forms a fruitful subject of ethical speculation.

Katydid, large long-horned insects of the grasshopper family, common throughout the United States east of the Rockies. Their name comes from the sound these insects make.

Kauri Pine, a large coniferous tree yielding a fine copal resin which ranges from Malay to New Zealand. The New Zealand Kauri, *Agathis australis*, is found only in N. Island. Some of the best Kauri gum comes from fossilised pines and is dug out of the soil far from any living trees.

Kava, a refreshing drink made from the pounded root of the pepper plant (*Piper methysticum*) and the national drink of Tonga.

Keep, the central tower or chief stronghold of an ancient castle, sometimes called the donjon.

Kelpie, a water-sprite of Scottish fairy-lore, whose appearance assumed various forms, and foreboded drowning to the person who saw it. In Australia the Kelpie is a valuable sheepdog.

Kentish Fire, a noisy, long-continued kind of cheering and clapping of hands which originated in Kent at the Protestant meetings held in 1828–29 to oppose the Roman Catholic Relief Bill.

Kentish Rag, a kind of fossiliferous clayey limestone found in Kent. Used in building.

Keratin, a hard protein material of which horns, nails, claws, hoofs, and reptiles' scales are made.

Kermes, a crimson dyestuff, less brilliant than cochineal, but more lasting. It is made from the bodies of the females of a small oak-inhabitting insect (*Coccus*) found in immense numbers on the coasts of the Mediterranean.

Kerosene, an illuminating oil distilled from petroleum and shale. Also called paraffin.

Kersey, a coarse kind of woollen cloth, originally made at Kersey, in Suffolk, and much used in the Middle Ages for ordinary men's clothing.

Kestrel, the most common British falcon, well known for its habit of hovering for minutes at a time with vibrating wings and then swooping down to attack mice and insects. The male has spotted chestnut-brown back, greyish head and tail, which has a broad black band near tip.

Ketch, a sailing vessel formerly in considerable vogue, with two tall masts fore and aft, and clear amidships.

Kew Gardens, officially known as the Royal Botanic Gardens, are among the most celebrated gardens in the world. They were started in 1759 by Princess Augusta of Saxe-Gotha, widow of Frederick, Prince of Wales, and mother of George III. They remained private property until 1841, when control passed to the Commissioners of Woods and Forests. They now cover 300 acres and are administered by the Min. of Agriculture, Fisheries, and Food. Since 1841 the gardens have been open to the public, and form one of the most attractive resorts near London.

Key, a musical term indicating the central dominating note that gives the melodic order in which the tones of a tune or composition are arranged. It is the starting-point, and different starting-points demand different scales. The natural key of C, for instance, requires no flats or sharps; all other keys require the use of sharps or flats to bring the notes of their scales into proper relation.

Keys, House of, is the Manx representative assembly. (*See* **Tynwald**.)

Keystone, the stone which occupies the centre and highest point of an arch and is usually the last to be inserted.

Khaki, a clay-coloured cloth adopted for uniforms in the British Army in the time of the war with the Boers, and used in the first and second world wars. First used by Indian regiments.

Khan, a title formerly of importance in Eastern countries, and given to princes and governors of states, but now of too common use to be much more than a mere courtesy designation. Also the name of a caravanserai.

Khedive, the title borne by the viceroys of Egypt from 1867, after Ismail Pasha's arrangements with the Sultan establishing hereditary succession in his family. It was abolished by the British in 1914.

Khonds, a race of aboriginal East Indians occupying the jungles and lower regions of Orissa, and formerly noted for their frequent human sacrifices, which, however, have been prohibited since 1842.

Kilderkin, once a common liquid measure in England, representing 18 gallons.

Kilogram, a unit of mass equal to 2·2 lb. One kilogram equals 1,000 grams.

Kilowatt, a unit of electrical power; equals 1,000 watts, and is equivalent to about 1⅓ horsepower. An average electric fire "burns" 2 kilowatts of electricity. Electric power of 1 kilowatt used continuously for an hour represents an energy consumption of 1 kilowatt-hour; this is commonly called 1 "unit" of electricity.

Kilt, a short pleated plaid skirt-like garment forming part of the Highland costume, and reaching from the waist to the knees. In olden times it was simply the lower part of the belted plaid.

Kindergarten, a system of infant education ("garden of children") invented by Friedrich Fröbel in 1837 and introduced into England in 1854, based on the activity of the pupils themselves by means of toys, games, and singing—things in which children take delight naturally. The system is now well established in nearly all countries, having been developed on very successful lines in the primary schools of England.

King Crab, remarkable crustaceans inhabiting the sea coasts of America, Japan, India, and Malay Peninsula, carrying a shield-shaped shell, and having a long pointed spine projecting from the posterior. The body comprises three separate sections articulated together. These crabs—in America known commonly as the horseshoe crab because of their shape—are from 18 in. to 2 ft. in length. Fossil king-crabs are found as far back as the Silurian. There are about six living species.

Kingfisher, a well-known family of brilliant-plumaged birds, found in all continents, comprising some 250 species and sub-species. The British kingfisher, *Aceldo atthis*, haunts the rivers and streams, and is one of the most beautiful of native birds, having iridescent blue-green, salmon pink, and rich chestnut in its plumage and bright-red feet. All kingfishers have long, dagger-shaped bills. In the Malayan region, New Guinea, the Moluccas, and Australia the varieties are very numerous. The quaint *Laughing Jackass* of Australia is among the largest of the kingfisher family. The European kingfisher is the bird of the Greek legend of the Halcyon.

King-of-Arms, the name of the chief officials of the Heralds' College. There are several in England—the principal being those of the Garter, Norroy, Clarencieux. (*See* **Heralds' College**.)

Kinkajou *or* **Jupura**, a carnivorous animal of the raccoon family, having a yellow brown fur. It is common in the forests of Central and South America, lives mostly in the trees, feeding on birds, fruit, insects, etc. Its tail is prehensile.

Kiosk, a word of Russian or Turkish origin meaning a small open pavilion of light construction much used in Eastern countries as a place of shade and rest. Similar structures are common in the streets of Paris as news and advertisement stands, and in London as telephone offices.

Kirimon (*Kiri no go Mon*) and **Kikumon** (*Kiki no go Mon*), the two Japanese imperial crests, the first a design of leaves, stems, and flowers of the Paulownia plant, and the other representing the sixteen-petalled chrysanthemum.

Kirk, the Church of Scotland. Kirk-Session is a "court" of the Presbyterian churches, consisting of the ministers and elders.

Kismet, a word signifying fate, destiny, or doom, frequently employed (or its equivalent) in most Oriental countries, and also in considerable use in European literature and speech.

Kit-Cat Club, a famous club formed in the early part of the 18th century, and having among its members many notable people, including Addison and Steele. It derived its name from the pastrycook who served it with pies—Christopher Cat—and has had its existence commemorated in a special size of portrait called a "Kit-Cat," because of the fact that the portraits of the members of the club were all done (by Sir Godfrey Kneller) to this size—36 in. long by 28 in. wide. Its summer meetings were held at the Upper Flask Inn, Hampstead.

Kitchen Middens, the name designating certain large mounds, presumably the sites of prehistoric villages, distinctive features of which are stone-hearths. These mounds contain large quantities of fossil remains of edible molluscs, bones of birds, animals, and fishes, fragments of implements, etc. They exist in the largest numbers on the east coast of Denmark, and here and there on the coasts of Scotland, Ireland, England, and N. America, and belong, it is supposed, to the early Neolithic Age.

Kite, name of several birds of prey, widely distributed, related to the hawks and eagles, graceful in flight, and distinguished by their long wings and deeply forked tails. The red kite, light chestnut brown, once the most familiar bird of prey in Britain, seen scavenging the streets of London, is now the rarest, and found only in Wales. The Egyptian kite and the pariah kite of India, notorious for their daring thefts, are closely related to the black kite, a smaller European species, with less forked tail and blackish-brown plumage.

Kittiwake, a beautiful white and pearl-grey gull with black legs, dark eyes, and greenish-yellow bill. Its range is wide, and includes the British Isles, where it is a local resident. The flight of this only truly oceanic gull, which excepting in the breeding-season, is generally found offshore is graceful, swift, and buoyant. A triangular black patch, noticeable on the ends of the wings when open, is characteristic of the species, as is the call kitti-wake, from which the bird derives its name. It nests in colonies on the ledges of caves and steep cliffs.

Kiwi, flightless, stoutly-built birds of New Zealand, now very rare and carefully protected by the Government. They are little larger than a domestic hen, and lay astonishingly large eggs for their size. Incubation and care of chicks fall to the male bird. They have rudimentary wings concealed by the plumage, and the feathers are hair-like. They are nocturnal in habit.

Knighthood is a degree of honour or title common in Europe since the Middle Ages, and was at first exclusively a military order. In Great Britain the four main orders of knighthood are those of the Garter, the Bath, the Thistle, and St. Patrick; in addition to which there are several other orders, such as the Order of St. Michael and St. George, the Star of India, etc. There are also Knights Bachelors, such as are not associated with any special order. The title is not hereditary, and therefore ranks below that of a baronet, though both are entitled to the prefix "Sir."

Knot, a nautical measure of speed (1 sea mile per hour), and formerly measured by a log-line, divided by knots at equal distances $\frac{1}{120}$ of a geographical mile. The number of knots travelled by the ship in half a minute corresponded to the number of sea miles it travelled per hour. A sea mile is equal to about 1⅙ of a statute mile.

Knout, formerly a Russian instrument of punishment, consisting of a whip of many thongs, used upon Russiam criminals since the 15th century. A hundred and twenty strokes were considered equivalent to a sentence of death, half that number sufficing to kill in many instances. Czar Nicholas I., however, changed the form of the knout, and made it a much milder instrument.

Knuckle-duster, a formidable apparatus contrived for the purpose of protecting the knuckles and to add force to their use; frequently employed by garotters and other lawless ruffians.

Koala, the Australian arboreal marsupial mammal that looks like a toy teddy-bear, with ashy-grey fur, bushy ears, and rudimentary tail. It feeds on the leaves and shoots of certain eucalyptus trees, and is not more than 2 ft. in length.

Kohl, a powder prepared from antimony or burnt almond shells, and in common use by the women of the East for darkening the eyelids.

Koran, the sacred book of Islam and the most influential book in the world next to the Bible. According to Islamic belief, the words were revealed to the prophet Mohammed by God through an angel Gabriel at intervals over a period of 20 years, first at his native Mecca, and then at Medina. The book is divided into 114 *suras* or chapters; all but one begin with the words "In the name of Allah, the Merciful, the Compassionate." It is written in classical Arabic, and Moslems memorise much or all of it. The first English translation made direct from the Arabic was by George Sale, London, 1734.

Koreish, an ancient Arab tribe whose members kept guard over the sacred stone of Mecca before the rise of Mohammed. They opposed his view and compelled him to quit Mecca but they were ultimately defeated by Mohammed and his followers.

Kos, a Jewish measure of capacity, equivalent to about 4 cu. in.

Koto, a musical instrument in general use in Japan consisting of a series of 13 silken strings stretched across a curved wooden surface, and played with the fingers. Each string is 5 ft. long, and has a separate bridge so fixed as to give the vibration necessary for the note it has to produce. It is a sort of horizontal harp, and in the hands of an expert player is capable of giving forth excellent music.

Koumiss, a beverage made from mare's milk fermented, and often served up with cooked grain; a common refreshment of the Arabs of Africa and some of the tribes of Asia, particularly the Tartars.

Krall, a hut or collection of huts in an African village.

Kraken, a fabled Scandinavian sea monster, around which many legends and superstitions have been formed in Norway. It is generally described as a sort of sea-serpent, and was so large and weird of form as to be mistaken, so the tradition runs, by fishermen for an island.

Kremlin, a large fortified citadel in Moscow, containing the cathedral in which the Czars were crowned, an imperial palace, and important garrisons and arsenals. At the foot of the Ivan Tower rests, in a cracked condition, the famous great Ivan Bell, weighing 200 tons. The Kremlin is now the headquarters of the Soviet Russian Government.

Krishna, one of the Hindu deities, and a chief character in the Mahabharata epic.

Krypton, one of the rare gases, occurring in the air to the extent of 1 part in 20 million. It was discovered in 1898 by Ramsay and Travers.

Ku-Klux-Klan, a secret political organisation in the Southern States, active after the close of the Civil War and having for its chief aim the establishment of white control. Suppressed in 1871 by the Enforcement Act (popularly known as the Ku-Klux Act or Force Bill) after numerous outrages had been committed. Revived between the two world wars as a sadistic anti-Negro, anti-Jewish, anti-Catholic society, spreading to the North as well as the South.

Kümmel, a German cordial, flavoured with cumin, carraway seeds, or fennel.

Kuomintang, the Chinese "People's National Party," founded by Sun Yat-Sen in 1912 after the successful National Revolution of 1911. Sun Yat Sen sought to establish a democratic Republic modelled on western parliamentary democracy and in his famous "Testament" laid down the principles upon which the constitution of China was to be based. After his death in 1925 Chiang-Kai-shek emerged as leading man in China. Beginning as a Russian-inspired revolutionary movement, the Kuomintang developed into a reactionary oligarchy and collapsed in 1949 when the Nationalist forces suffered military defeat by Communists.

Kussier, a Turkish musical instrument consisting of five strings stretched over a sort of kettle-drum.

Kusti, the sacred cord or girdle of the Parsees, consisting of 72 threads—the number of the chapters of the Izashue—and two branches, each branch containing six knots, together standing for the 12 months of the year.

Kutch, the packet of vellum leaves in which gold is placed for the first beating; the gold-beaters' skin packet into which the leaf is placed for the second beating is known as the "shoder."

Kutia, a special Russian dish eaten after a funeral ceremony at church or cemetery, and composed of boiled rice or other cereal mixed with honey and raisins, the ingredients being supposed to possess some symbolical significance.

Kvass, a common Russian fermented beverage made from an infusion of flour or meal or dough of rye, wheat, or malt. A superior kind is made from fruits.

Kylix, the name given in ancient Greece to a graceful double-handled drinking-cup, in general shape something like a modern champagne glass.

Kyrie Eleison ("Lord, have mercy"), the name of a common form of prayer in the Anglican, Roman Catholic, and Greek Churches; also applied to the English Church responses after the recital of the commandments.

Kyrle Society, named after Pope's "Man of Ross," John Kyrle, founded by Miss Miranda and Miss Octavia Hill in 1875, and having for its object, the decoration of workmen's clubs, hospitals, etc. and the promotion among the poor of a taste for literature, music, and outdoor recreation.

L

L.S.D., from the Latin libra (a pound), solidus (a shilling), and denarius (a penny), introduced by the Lombard merchants.

Labarum, the standard of Constantine the Great, adopted after his conversion to Christianity, marked with his seal, and represented upon the coinage.

La Belle Sauvage, a site on the north side of Ludgate Hill, famous for the inn that stood there from the fifteenth century to the early nineteenth. The site was blitzed during the second world war.

Labourers, English Statute of, was passed 1350–51, with the object of compelling labourers to accept a certain rate of wages and not leave their employers' service, the Plague having rendered labourers so scarce that they were in great demand and had been insisting on higher pay. These enactments were bitterly opposed and led to the "Peasants' Revolt," headed by Wat Tyler.

Labradorite, a felspar of a pearly lustre on cleavage, found in masses in igneous rocks, the best samples of which come from Labrador.

Labyrinth, or **Maze**, a combination of roads and passages so constructed as to render it difficult for anyone ignorant of the clue to trace the way to the central part. The Egyptian labyrinth near Lake Mœris had 3,000 rooms, half of them subterranean and the remainder above ground. The labyrinth in Crete, according to Greek myth, was built by Dædalus to house the Minotaur. There was one at Lemnos, renowned for its stalactite columns; and another at Clusium constructed by Porsenna, King of Etruria, about 520 B.C. The labyrinth in which Fair Rosamond was concealed was at Woodstock. Hampton Court maze dates from the 16th century.

Labyrinthodonts, gigantic fossil amphibians which get their name from the curious labyrinthine structure of their teeth. They occur in the Red Sandstone formation, and remains have been found in Britain and other parts of Europe. Their heads were several feet long, and their footprints, by which they were discovered, closely resemble the prints of the human hand.

Lac, a resinous matter deposited on the branches of a number of tropical trees by the females of the lac insect, the exudation including eggs and a viscous covering. At the gathering time the twigs are broken off and dried in the sun, when

the insects die, and the lac that remains is termed *stick-lac*. From this, by the removal of extraneous accretions and dissolving, *seed-lac* is produced. *Shell-lac* is seed-lac after it has been melted and otherwise prepared, and this is the best known of the lacs, being used in printing and the manufacture of varnishes and sealing-wax, and for other commercial purposes.

Lac, or Lakh, a Sanskrit word, meaning a mark, used in India to indicate a lac, *i e.*, 100,000 rupees.

Lace, a delicate fabric of linen, silk, or cotton threads, made by hand or machinery, and worked in various ornamental designs. The kinds of lace are many, deriving their distinctive names either from the method employed in production or from the place where any special variety was originally made. The best-known makes are pillow or bobbin-lace, woven and plaited by hand; needle-point lace, worked by the needle over a traced design; and machine lace, which practically dates from Heathcote's invention of the early part of the 19th century. Some of the most famed laces are the following: *Alencon*, a needle-point lace; *Brussels*, a very fine kind, with needle-point sprigs and flowers; *Chantilly*, a silk variety with flowers and open-work; *Cluny*, a netlace with darned stitch; *Honiton*, a delicate kind with dainty sprigs and figures; *Mechlin*, generally made in one piece and very varied in design; and *Valenciennes*, or bobbin lace, of great durability, the pattern and ground of which are made at the same time, being one of the best and most costly of laces, now manufactured mainly in Belgium.

Lace-Wings, insects with frail, transparent, and much-veined wings whose grubs eat large numbers of insect pests such as aphids. The eggs are borne at the ends of threads attached to plants.

Lachesis, a genus of venomous snakes of the rattle-snake family confined to tropical countries, and including the "deadly bushmaster," of Surinam, and several Crotalidæ pit-vipers of Guiana and Brazil.

Lacquer, a varnish made from shellac and certain colouring matters, and utilised for imparting lustre to various surfaces of metal or wood. In China and Japan the production of lacquer ware of a decorative character has long been an important industry, bringing into use gold, coral, vermilion, sprinkled, and other lacquers, with pleasing effect.

Lacrimoso, a musical term denoting a mournful method of playing; sadly, with feeling.

Lacrymatory, tube-like vessels of glass found in graves of the ancients of the urn-burial period, and supposed by some to have been the receptacles of the consecrated tears of lamenting friends, but really used for holding ointments or perfumes.

Lacs-d'Amour, a cord of running knots worn on the arm at one time by widows and unmarried women to denote their condition.

Lactic Acid, an organic acid that may be obtained by fermenting milk sugar (lactose). It is formed in muscular tissue when this is active.

Lactometer, a tube or instrument for ascertaining the proportion of cream in a quantity of milk. Called also a galactometer.

Ladder, a framework of portable steps, made of wood or metal. There are innumerable varieties, according to their uses. Thus: the standing-ladder, the step-ladder, scaling ladder, companion ladder, collapsible ladder, etc.

Ladybird, the common name of a large family of beetles—the *Coccinellidæ*. The insect is usually of a red or yellow colour with small black or coloured spots. Ladybirds are of good service to the gardener because their larvæ feed on aphids. There are about 2,000 species.

Lady-Day, the day of the festival of the Annunciation of the Virgin Mary, Mar. 25. One of the four English quarter days.

Lagoon, a stretch of shallow water opening out upon the sea. Venice is built on lagoons.

Lake Dwelling, certain prehistoric habitations originally built above the waters of lakes or rivers, evidences of which have been found in Switzerland, Britain, and other parts of the old and new worlds. They were erected on platforms supported by piles, the stumps of many of which still remain. The most valuable evidences in this connection, however, are the recovered fragments of pottery, bone, flint, bronze, and iron implements, as well as some few human skeletons, affording interesting testimony to the primitive existence led by the lake dwellers.

Lakes are bodies of water collected in depressions of the earth's surface. The most notable lakes are the Great Lake series of North America, including Lakes Superior, Michigan, Huron, Erie, and Ontario, all discharging into the St. Lawrence River. Africa has an enormous area of lakes, including the Albert Nyanza and the Victoria Nyanza, forming the sources of the White Nile, Lakes Tanganyika, Nyassa, Tchad, etc. Smaller lakes are numerous in other countries—Switzerland, Germany, Italy, England, Ireland, Scotland, all having their lake regions, where the scenery is invariably beautiful and romantic.

Lake School, the name given, at first in ridicule, to a distinguished trio of poets—Wordsworth, Coleridge, and Southey—who made their homes in the English Lake District.

Lalo, the leaves of the Baobab, dried and powdered; a favourite food of certain African tribes.

Lama, a priest of the Tibetan Buddhists. At the head of the hierarchy is the Grand or Dalai Lama. The priesthood constitutes the civil as well as the religious government of Tibet. When the Dalai Lama dies, his spirit is held to pass into a new-born infant; a royal search is instituted, and the child selected as the new Dalai Lama is recognised by certain bodily marks. Second in importance is the Tashi or Panchen Lama, regarded as an incarnation of Amitabha, a Buddha.

Lamellibranchs (**Pelecypods**), the class of molluscs to which the oysters, cockles, mussels, clams, and scallops belong. In these animals the body, which is compressed laterally, is enclosed in two hinged shells held together by muscle action. The gills are thin plates, hence the name "lamellibranch." All are aquatic molluscs.

Lamellicornia, a group of beetles, distinguishable because the antennæ are made up of a number of plates. The Lamellicorn beetles are herbivors and number several thousand species, the best-known being the stag-beetles, cockchafers, and scarabs.

Laminarians, seaweeds with long ribbon-like fronds.

Lamination, a geological term designating a class of rocks with thin cleavages, such as slate or shale.

Lammas Day is one of the oldest of the Church festivals, probably derived from the loaf-mass (hlafmæsse) of the Anglo-Saxons. It occurs on August 1. In the olden times it was the day when loaves were given in place of first-fruit offerings.

Lammergeyer, the bearded vulture of alpine regions, resembling an eagle in appearance. It has a white head with black tufts at base of the bill, and its general plumage is dark brown, nearly black. It is found in the remote mountain ranges from Southern Spain to China, and is becoming scarce.

Lampblack, a carboniferous pigment obtained from flame-smoke, and now produced in specially constructed furnaces in which bodies rich in carbon, such as tar, resin, petroleum, etc., are burned. The smoke or soot resulting is collected from the sides of the furnace, and forms lampblack. It finds use in making printer's ink, black paint, etc. Being a very pure form of carbon, it is also utilised in the manufacture of dynamo brushes and arc-lamp carbons.

Lamprey. These fish differ from those with which most people are familiar in having no jaws, no paired fins, and no scales. Together with the hagfishes, the lampreys are placed in a special class—the Cyclostomes. There are three British lampreys; all are eel-like in form.

Lamps are vessels for holding an illuminating agent, and in modern times are of many kinds. In Anglo-Saxon times they were made of horn. The first public street lamps were oil lamps, London being lighted in this manner in 1681. Gas lamps were introduced in 1814. A great

advance was made in domestic lamp illumination by Argand, a Frenchman, in 1787, who invented a lamp having a circular burner or wick. The flame was oxygenised by the admission of a current of air greatly increasing the brilliance of the light. Among the more distinctive lamps of later times are the various electric lamps, the incandescent gas lamps, the paraffin oil and naphtha spirit lamps, the submarine lamp for burning under water, and the Davy safety lamp for colliery use.

Lance, a military weapon which was up to 1927 carried by cavalry regiments, and consisted of a long spear for hurling at or charging an enemy with. The war lance of the Middle Ages was about 16 ft. long.

Lancelet. (*See* **Amphioxus.**)

Lancers, light cavalry soldiers. Most European armies had regiments of Lancers—the Russian Cossacks, the German Uhlans, etc.—but there were no regiments of Lancers in England before 1816. There were four regiments in 1939.

"Lancet," the name of a noted English medical journal, established in 1823 by Dr. Wakley.

Land Crab, a family of crabs (*Gecarcinidæ*) which live mainly on land, though migrating to the sea to deposit their eggs.

Land League, an association formed in 1879, with Parnell as president, for compelling a reduction in the rents of land, and a reconstruction of the land laws in Ireland, and in case of non-compliance refusing to pay rent. For a time this League exercised great political influence and was an important aid to the Home Rule agitation.

Landrail, popularly known as the Corncrake, is a regular summer visitor to Britain, and is well known by its harsh and piercing note, so familiar in cornlands in the night time.

Landslip, a breakage of a mass of soil or rock away from a mountain, hill, or cliff, due to a variety of natural causes, such as the saturation of the earth by water or the decay or slipping of portions of rock. Many serious landslips have occurred from time to time. In 1618, an earthfall happened at Plurs on Lake Como, involving the destruction of many buildings and the loss of numerous lives. In 1806 a portion of Rossberg mountain in Switzerland slipped from its position, and falling into the valley below buried many villages and hamlets and over 800 people. A chalk cliff from 100 to 150 ft. high and three-quarters of a mile long fell at Lyme Regis, in Dorsetshire, in 1839, doing great damage. Over 200 people were killed by a landslip in Naini Tal, in India, in 1880; and at Quebec, in 1889, a rocky eminence called Cape Diamond gave way, many buildings being destroyed and lives lost. Notable landslips in recent times have occurred at Amalfi (Italy) in 1924, and at Murchiston (New Zealand) in 1929.

Langue d'oc and Langue d'oïl, the two principal mediæval French dialects, *oc* and *oïl* being their respective words for the affirmative particle (modern French *oui*). *Langue d'oc*, spoken south of the Loire, was the language of the troubadours. Provençal, one of its dialects had a literary revival in the 19th century under the influence of the poet Frédéric Mistral. *Langue d'oïl* was spoken in northern France, and it was the dialect of the Paris region which developed into modern French.

Lantern, a case for enclosing, holding, or carrying a light. In its earliest form it was made of horn, and called a lanthorn, but the name now covers a variety of forms, from the large stationary lantern of a lighthouse to a Chinese collapsible paper lantern. (*See* **Magic Lantern,** etc.)

Lantern Fly, bugs belonging to the family *Fulgoridæ* in which the head is drawn out to form a lantern-like structure. In no instance is the "lantern" luminous, though naturalists used to think it was.

"Lantern of England." Bath Abbey possesses so many windows that it is called sometimes the "Lantern of England." Among numerous interesting monuments Bath Abbey contains that of Malthus author of *Essay on Population.*

Lanthanum, a metal belonging to the rare earth group of metals, discovered by Mosander in 1839.

Lapidary, a cutter of, or dealer in, precious stones; also used in adjective form in regard to the working, engraving, or setting of stones.

Lapis Lazuli, an azure-blue mineral. The pigment ultramarine is made by grinding it, though artificial ultramarine has largely superseded it. The mineral (also called *lazurite*) has been used as a gemstone since ancient times.

Lapwing *or* **Green Plover,** familiar British bird on moors and marshlands with iridescent greenish-black plumage, white underparts, and black crest. Often called "peewit" from its cry.

Larboard is the old nautical term indicating the left-hand side of a ship, and changed by Admiralty order to "port" in 1844. Starboard is the right-hand side.

Larch, a familiar coniferous tree in the mountain regions of northern Europe, and though not native to Britain, the Common Larch is successfully cultivated in various parts of the kingdom. It is one of the best of all turpentine-yielding trees, and the bark is valued for tanning. The larch is an unusual conifer in being deciduous.

Lares were tutelary deities of the ancient Romans, and of two classes, *Lares domestici*, the household gods, and *Lares publici*, the gods of public places. Both classes were represented by images or statues.

Larid, a bird of the *Laridæ* or gull family.

Lark, a family of song birds (*Alaudidæ*) of many species, some of which—notably the skylark—are famed for their habit of soaring into the air, singing all the while. They build their nests on the ground in the open country and, except for the black lark of Russia, have streaked brown plumage. The skylark and woodlark are the best known British species, while the crested lark and shore lark are among the occasional visitors. Africa has the greatest number of larks; America has only one species, the horned lark.

Larkspur, the common name of the genus *Delphinium*, a favourite flower introduced into British gardens from Switzerland in 1573.

Larva, the undeveloped form of any animal which, before maturity, undergoes metamorphosis.

Lateen, a triangular sail affixed to a tapering yard used on light cargo vessels of the Mediterranean.

Latent Heat is the quantity of heat required to convert 1 gram of a substance from solid to liquid (latent heat of fusion) or from liquid to vapour (latent heat of vaporisation). Thus when a solid changes into a liquid or a liquid into a gas, the addition of heat to bring about the change produces no rise in temperature, the energy being absorbed in the form of latent heat. An equal amount is released when the process is reversed. The latent heat of fusion of ice is about 79·6 calories per gram and that of the vaporisation of water about 539 calories per gram.

Lateran Councils were the religious conventions held in the Lateran basilica at Rome for deciding important questions of Church doctrine. The most brilliant was that of 1215, which pronounced in favour of a Crusade. That of 1869–70 pronounced the infallibility of the Pope. (*See* **Œcumenical Councils.**)

Lateroflexion, a scientific and pathological term signifying "a bending aside."

Latin America. The Spanish-speaking, Portuguese-speaking, and French-speaking countries of N. America, S. America, Central America, and the W. Indies.

Latitude of a point on the earth's surface is its angular distance from the equator, measured on the surface of the earth in degrees, minutes, and seconds. Thus the equator is 0° Lat. and the poles 90° Lat. (N. or S.). First determined by Hipparchus of Nicæa about 160 B.C.

Latitudinarians, a body of theologians whose object was to enlarge the scope of the Anglican Church so as to bring the Nonconformists within its fold, and included such eminent 17th-century divines as Burnet, Tillotson, Hales, and Chillingworth.

Laughing Gas is nitrous oxide, and received its name from the fact that the first effect to be noticed was that of producing exhilaration. One of the earliest anæsthetics, it is still much used in dentistry and for minor surgical operations.

Launce, a family of eel-like sea fishes found in large numbers on the coasts of North America and Europe. There are two species common to British waters. These fishes are of a bright

silvery hue, and live much in the sand underneath the water. They are prized as bait.

Laurentian Shield refers to a group of Pre-Cambrian rocks in the region of the Upper Lakes of Canada, nearly 2 million sq. m. in extent. Of enormous importance to Canada on account of the mineral wealth, forests yielding valuable timber and wood-pulp, and water-power.

Lawn, very fine sun-bleached linen, in olden time called "cloth of Rheims."

Lead, a soft malleable metal, occurring in numerous ores, which are easily smelted. It is found in its native form in small quantities in Sweden. Lead is largely used in plumbing on account of its pliability, and as an alloy element it combines in the formation of type metal, stereo metal, shot metal, pewter, and many other compounds. Lead mining is carried on in several of the northern counties of England and in Wales. The world output of lead ore before 1939 averaged 1,800,000 tons per annum, of which about one-fourth ws raised within the British Empire, Australia being the chief British lead-producing region.

Leaf Insect, a group of insects related to the locusts and grasshoppers which in colour and form closely resemble leaves.

Leaf Miners, larval insects which tunnel between the upper and lower skins of leaves. Most leaf miners are caterpillars of tiny moths; some sawfly larvæ have the same habit.

Leagues, or combinations of kings, countries, communities, have been frequent since the kings of Canaan united against the Israelites. Among the most famous leagues may be mentioned the Holy or Catholic League, which prevented the accession of Henry IV. of France until he became a Roman Catholic; and the League of Augsburg against Louis XIV. of France in 1686.

League of Nations, was founded on Jan. 10, 1920, with the object of promoting international peace and security. The original members were the signatories to the Peace Treaties at Versailles, and membership grew to fifty-three as new nations and ex-enemy States were admitted. Two notable absentees were the United States and Soviet Russia, the latter not being represented until 1934. Germany was a member from 1926 to 1933. The League had an Assembly which met at Geneva every year and a Council which met five or six times a year. The Permanent Court of International Justice sits at The Hague. The final Assembly of the League was held at Geneva between April 8 and 18, 1946. Its place has been taken by the United Nations. The International Labour Organisation, set up by the League of Nations met on April 20, 1944, at Philadelphia and resumed its old quarters at Geneva under the new organisation in 1946.

Leap Year *or* **Bissextile,** was fixed by Julius Cæsar, 45 B.C., the addition of one day in every four years bringing the measure of the calendar year even with the astronomical year, with three minutes per year over. The Gregorian Calendar corrected this by dropping leap year at the centuries not divisible by 400. For instance, 1700, 1800, and 1900 were not leap years.

Leather was made in ancient Egypt, Greece, and Rome, and has through succeeding centuries played an important part in the service of man. It consists of the dressed hides or skins of animals after the process of tanning has been gone through. Untanned skins are known as pelts. Leather is classed either according to the skins from which it is made or the system of preparation employed. The best-known kinds are morocco, kin, Russian, chamois, Cordovan, grained, patent, russet, tan, calf, Hungarian.

Leather-Jacket, the larva of the Crane-fly (daddy-long-legs). Leather-jackets can prove serious pests of grassland.

Leaven, a mixture of flour and sour milk, formerly used in fermenting large quantities of fresh dough, a preparation now superseded by yeast.

Lebensraum, a German slogan for "living space."

Leech, an aquatic blood-sucking worm, mostly found in fresh-water ponds. Each end of the body is provided with a sucker, but that at the head end has jaws and teeth. The medicinal leech has three jaws. The leech attaches itself with avidity to animal bodies and sucks until glutted.

Leeward, a nautical term, meaning the sheltered side of a vessel—that is, the opposite side to that from which the wind is blowing.

Legal Aid. *See* **C12** (1).

Legal Tender. *See* **N9.**

Legerdemain, sleight of hand, conjuring, juggling, a kind of performance in which trick and dexterity of hand deceive the eye and give the impression of feats that are naturally impossible.

Legion, a body of Roman troops, varying in numbers at different periods. A legion was divided into 10 cohorts, and every cohort into three maniples. Three legions composed the Roman army of occupation in Britain.

Legion of Honour, the French order for distinguished services, military or civil, was instituted by Napoleon I. in 1802, and confirmed and modified under later rules. There are five grades—Grands Croix, Grands Officiers, Commandeurs, Officiers, and Chevaliers.

Legitimists, supporters of the claims of the elder branch of the Bourbon family to the throne of France. The death of the Comte de Chambord in 1883 childless transferred the right of claim to the Comte de Paris, head of the younger Bourbon branch. Now applied to any supporter of monarchy by hereditary right as against a parliamentary or other title.

Legume, the fruit typical of the pea, bean family, or *Leguminosæ*.

Leitmotif, a musical theme intended to represent a particular idea and introduced whenever the composer wishes that idea to be held in mind. Wagner made use of the leitmotif to such an extent that his enemies said that each of his characters presented a visiting-card.

Lemming, small light-brown rodents with dark spots, abounding in Scandinavian countries and in Siberia. The lemming is about 5 in. long, with a short stump of a tail. The migrations of the lemming are famous: so insistent is the urge to keep moving that these animals will march on into the sea in their thousands and be drowned.

Lemur, the most primitive member of the Primate order of mammals (to which man, apes, and monkeys also belong). They are noted for having strong pliant toes enabling them to use their feet as hands, and also well-developed thumbs on the hands. They have long squirrel-like tails, fox-shaped heads, and large staring eyes, and are distributed over the tropical parts of the Old World, being most abundant in Madagascar.

Lend-Lease, an arrangement made by the U.S.A. in March 1941 to provide goods, services, and capital facilities to nations whose fighting contributed to her own defence. The principal beneficiaries were Great Britain and Soviet Russia. There was to be payment or repayment in kind, property, or other benefits to the U.S.A., but when the time of settlement came goods already consumed were written off the account and the recipient countries were asked to make some payment for what remained in existence. By the end of the war practically all the Allies were giving each other Mutual Aid, as it was called, making available their own resources for the use of others in the task of defeating the common enemy. It is estimated that Lend-Lease aid given by the U.S.A. amounted to over £12,000 million and Mutual Aid given by Great Britain to over £2,000 million.

Lenses are, broadly speaking, either *convex*, having the thickest part in the centre and magnifying objects, or *concave*, with the thinnest part in the centre and reducing the objects. Each kind has several varieties, peculiar from their proportions, arrangements, and specific effects.

Lent, the forty days' period of fasting that precedes Easter.

Leo, one of the twelve signs of the Zodiac, bounded on the west by Cancer, and on the east by the Virgin. The constellation consists of seventy-five stars, of which Regulus (a double star) is the brightest. The Leonids, the best-known of meteor showers, radiate from a point in this constellation.

Lepidodendron, a fossil plant of gigantic height (nearly 100 ft.) bearing a cone-like fruit, frequently met with in the coal strata.

Lepidoptera, the order of insects to which the 90,000 butterflies and moths belong.

Lepidosiren, a genus of S. American lung-fishes. In times of drought these fish burrow in the mud, and breathe by means of the air bladder which functions as a lung.

Lepus, the constellation of the Hare, situated under the Orion group, and one of the constellations with which the ancients were familiar.

Lernæa, a crustacean parasitic on fish. This "fish louse," after entering upon its parasitic stage, loses its external organs.

Letters of Administration. *See* **D18** (2).

Lettres de Cachet, sealed letters which the kings of France issued to their agents to secure the imprisonment of distrusted or disliked persons without trial. Abolished in 1789.

Levée, a State reception held by the Sovereign or his representative and attended by men only.

Levellers, an English military-political party prominent about 1647 in the Parliamentary army, which advocated the rights of the people.

Lever, a rigid bar of metal or wood used for raising heavy bodies, and worked by means of a support called the fulcrum placed underneath the lever.

Lewis, a contrivance for stone-lifting, the principle of which was known to the ancient Romans; it consists of two dovetail tenons of iron or other metal, expanded by an intervening key in a dovetail-shaped mortice in the stone, and shackled by a ringed bolt to the hoisting chain.

Leyden Jar, the earliest form of electrical condenser. Its invention is usually credited to Muschenbroeck of Leyden (1745). It consisted of a jar coated inside and out with tinfoil for about two-thirds of its height and having its inner coating connected with the top by a brass knob and chain. The jar was charged by connecting it to an electrostatic machine.

Li, a Chinese distance measure, about the third of an English mile. Also a Chinese weight, the thousandth part of an ounce, or liang.

Lias, a geological term referring to the lower section of the Jurassic group, and mainly comprising shales and limestones.

Libel. *See* **D14** (2).

Liberalism has grown historically from protest, political, economic, social or ethical, against what were regarded as the authoritarian aspects of the modern state. Its aim has been to remove obstacles blocking human progress, to gain personal liberty in all fields, and fiscal liberty in the form of free trade. It is the successor of the Whig Party, which in the 17th and 18th centuries stood for the limitation of royal power. From 1830 to 1885, the Whig, later the Liberal, was the dominant Party in parliament. In 1886 it split on the Irish Home Rule question. The close of the 19th century saw the fortunes of Liberalism at a low ebb, but at the election of 1906 the party was returned to power with an overwhelming majority. Up to the beginning of the First World War, the Liberal Government carried through a bold programme of social reform which laid the foundations of the Welfare State as we know it to-day. After the Coupon election of 1918, the Liberal Party gradually lost its hold on the electorate, and its forces were further decimated by the breakaway of the National Liberals in early 1932. In the crisis of 1931 the Liberal Party had joined the National Government and had accepted tariffs under an agreement to differ, but in the following year Liberal Ministers resigned from the Government on account of their opposition to the Ottawa Agreements. Certain Liberal Ministers who remained in the Government formed the nucleus of the National Liberals, who from that period onwards have given general support to the Conservative Party. Modern Liberal policy calls for the protection of the rights of the individual; for the freeing of World Trade; for a system of profit-sharing to bring harmony into industry and create a property-owning democracy, and for full support for the United Nations. It supports social legislation and also private enterprise. On nationalisation, Liberal policy demands that no undertaking should be nationalised until it has been clearly shown by an impartial enquiry that State control and ownership is necessary in the interests of the community as a whole. Liberals supported the nationalisation of the coal-mines, the railways, gas and electricity on these grounds. They opposed the nationalisation of steel, and stated in the 1951 General Election that they were opposed to any further nationalisation. In the 1959 general election the liberals returned 6 members to Parliament and polled 1,640,761 votes (5·9% of electorate).

Libra, the Scales, one of the twelve Signs of the Zodiac, lying east of the Scorpion.

Libraries, before the invention of printing, were few, and collected together at enormous cost. At Nineveh remains of libraries, consisting of tablets of baked clay, have been discovered. There were two libraries at Alexandria containing a vast collection of rolls or volumes, founded by Ptolemy I Soter (367–283 B.C.) and established by Ptolemy II Philadelphus (309–246 B.C.). Among the great libraries of later times may be mentioned the Vatican Library at Rome, moved to its present premises in 1588; the Royal Library in Paris which later became the Bibliothèque Nationale; The Astor Library, New York; and in England, the Bodleian Library, Oxford, and the British Museum Library at Bloomsbury. Since 1850 public libraries have been established in all the chief cities and towns of the kingdom. The first lending library was opened in Edinburgh in 1726. Mudies' circulating library was founded in 1852. Rate-born expenditure on public libraries in Britain in 1956–57 was nearly £16 million. In most villages there is a "county library centre" to which collections of books are sent by the County Library. In Great Britain there are 24,000 centres of this kind in village clubs, halls, shops, schools, and even homes. In some counties there is a library van or the bibliobus, as it has been called by a French writer. This travelling library tours on a pre-arranged time-table so that everyone knows exactly when it will arrive. Four of the best special libraries in the world are open to the public in London. They are:

1. The Library of the National History Museum (for zoology, geology, and related subjects).
2. The Library of the Science Museum (all branches of science and technology, except medicine).
3. The Patent Office Library.
4. The Library of the Victoria and Albert Museum, which is the national art library containing volumes and photographs on all aspects of fine, applied, and decorative art.

Full details of the large number of specialist libraries in London (including that of the British Library of Political and Economic Science, one of the best collections in the world on this subject, at the London School of Economics) will be found in *The Student's Guide to the Libraries of London*, by R. A. Rye, published by the University of London Press and *The Libraries of Greater London*, by L. M. Harrod, published by G. Bell. *See also* **Bodleian Library, British Museum, India Office Library.**

Libration, an astronomical term referring to an apparent irregularity in the moon's course, which may be libration in longitude or latitude, or diurnal, and due to a variety of causes.

Libretto, the word-book of an opera or oratorio. Usually the composer and the librettist collaborate in the writing of an opera, but several composers (*e.g.*, Wagner) wrote their own libretti. Boito, librettist to Verdi for "Otello" and "Falstaff," himself composed two operas, "Mefistofele" and "Nerone."

Licence is a permission given to do some act, which, without such permission, it would be unlawful to do. It usually refers to permits issued on payment of excise duty. Licences are required for keeping carriages, dogs, for operating a television or wireless set, for driving a motor vehicle, for shooting game, for setting up as a bookmaker, for hawking and peddling, for selling beer, ale, wines and spirits, tobacco, patent medicines, etc.

Licensing Hours for the sale and supply of liquor are fixed by the Licensing Act, 1921, at 9 hours

for London on weekdays and 8 hours for the provinces with 5 hours on Sunday. Local authorities have the power to modify these hours for various reasons (Market day, etc.).

Lichens. In every lichen, two plants are associated (a condition called symbiosis)—one being an alga and the other a fungus. The fungus derives its food from the alga; probably the alga gains too from the association, being protected against desiccation by the fungus. Lichens are the first plants to colonise on bare rocks.

Lictor, a public functionary of ancient Rome whose duty was to carry out the orders of the magistrates, punish offenders, and attend upon his superiors on all public occasions.

Lieder, the plural form of the German word *Lied* meaning song. It is applied particularly to poems set to music by the German romantic composers, Schubert, Schumann, Brahms, and Hugo Wolff.

Lien, the right by which a person holding personal property of another can retain possession of it until some claim that he has against the original owner is satisfied.

Life-Boat was invented by three men, Lionel Lukin who converted a coble into a boat for saving life in 1785; William Wouldhave, who discovered how to make a boat right herself if she capsized, and Henry Greathead, who built a life-boat, partly from Wouldhave's model, in 1789. This boat was stationed at South Shields, which was the first permanent life-boat station to be established. It was not until 1851 that the first life-boat able to self-right was built, and a motor was first installed in a life-boat in 1904. Modern motor life-boats have engines of from twin-18 h.p. to twin-80 h.p., with a speed of nearly 10 knots. All coastal life-boats in this country are maintained by the Royal National Lifeboat Institution founded by Sir William Hillary in 1824. The service is maintained by voluntary contributions and costs over £400,000 a year.

Light. The first demonstration that light had a finite speed in empty space was made by the Danish astronomer Olaus Roemer in 1675. Einstein postulated that the speed of light *in vacuo* was a universal constant and the maximum speed anywhere in the universe. Measurements of the speed of light using radio waves made by Dr. L. Essen of the National Physical Laboratory in 1947 have led to a value of 186,282 miles per second, which agrees well with the latest measurements made in Sweden using light waves. The velocity of light is a fundamental physical constant, basically involved in atomic theory and astronomical measurements.

Light Year. A measure of astronomical distance, equal to the distance light travels in the course of a year. A light year is thus 5.88 million million miles. *See also* **F3** (2).

Lighthouses, to warn ships of dangerous places and indicate coasts, points, harbours, etc., have existed since the building of the Pharos, a tower of white marble 600 ft. high, built by Ptolemy II Philadelphus at Alexandria about 280 B.C. In early lighthouses the lights were simple fires. The most famous and one of the earliest British lighthouses is the Eddystone (which see). The introduction of parabolic mirrors was a great improvement, providing a reflecting medium which intensified the light beam in the required direction. Further improvements were made by Fresnel, Stevenson, and others. A new Dungeness lighthouse is planned which will be revolutionary in design and the first in Britain to be fully automatic in operation. It will be powered by a small but extremely powerful lamp, and electronic equipment will control all the operations from switching on the main beam at nightfall to detecting presence of fog and sounding fog signals. The lighthouses of England and Wales, the Channel Islands, and Gibraltar are under the control of Trinity House; Commissioners of Northern Lighthouses control those of Scotland; and the Commissioners of Irish Lights control the coasts of Ireland. Particulars of lights in all parts of the world are published for the guidance of navigation in the *Admiralty Lists of Lights*, compiled annually by the British Admiralty.

Lightning, the flash of a discharge of electricity between two clouds, or between a cloud and the earth, when the strength of the electric fields becomes so great as to break down the resistance of the intervening air. With "forked" lightning the actual path, often branched, is visible, while with "sheet" lightning the flash is hidden by the clouds which themselves are illuminated. "Ball" lightning is the name given to the luminous balls which have been seen floating in the air during a thunderstorm. The Boys camera has provided much information regarding the sequence of events in a lightning discharge. It is found that a flash consists of a number of separate strokes, usually four or five, and that the discharge of electricity to earth begins with a faintly luminous "leader" moving downwards and branching at intervals. As the ground is approached a much brighter luminosity travels back along the conducting channels, lighting up the several branches. The multiple strokes which follow in fractions of a second have the same "return" nature and are rarely branched. Lightning flashes to earth damage structures, cause loss of life and endanger overhead power systems, often interrupting electricity supply. Such storms generally affect radio transmissions and present hazards to aircraft. Thunder-clouds may develop energy far exceeding the capacity of our largest power generating stations.

Lightning Conductor, a metal rod, the upper part of which is of copper with a conical point, the lower portion being iron, which extends into the earth. Its effect is to gather to itself the surrounding electricity and discharge it into the earth, thus preventing its falling upon the protected building. In ships, lightning conductors are fixed to the masts and carried down through the ship's keel-sheathing. Benjamin Franklin was the first to realise the possibilities of lightning protection and, in 1752, carried out his famous experiment of drawing electricity from thunder-clouds, with the aid of a sharp-pointed conductor fixed to a kite.

Lignin, a substance found in the cell walls of plants, being particularly abundant in all woody fibres.

Lignite *or* **Brown Coal,** an intermediate substance between peat and coal; it is, in fact, undeveloped coal, and known as brown coal. The best-known deposits in Britain are the Bovey Tracey Beds in Devon.

Lillibulero, an old marching song composed by Purcell. With words by Wharton, it is said to have "sung James II. out of three kingdoms." During the second world war it was used by the B.B.C. as a station identification signal preceding news bulletins.

Lily Family (**Liliaceæ**), one of the largest families of flowering plants, with 200 genera and 2,500 species. It includes the true lilies (*Lilium*), tulips and hyacinths. Useful vegetables belonging to the family are the onion and asparagus. Most members are herbaceous plants; shrubs or small trees occur in the genera *Aloe* (Yucca) and *Dracæna* (Dragon-tree).

Lime, an alkaline earth obtained from kiln-heated limestone, and used in making mortars and cements; a valuable fertiliser, particularly on acid and clay soils.

Limes, trees of the genus *Tilia*, including some 30 species spread over north temperate regions The word is a corruption of "linden." Limes native to Britain are the small-leaved *T. cordata* and the broad-leaved *T. platyphyllos*. The hybrid *T. vulgaris* was introduced into Britain from the Continent during the 17th century and is frequently seen in streets and parks. Lime-wood was used by Grinling Gibbons for his fruit, flower, and bird decorations.

Limestone is carbonate of calcium. It is found in every geological formation, and is often highly fossiliferous. Marble is limestone that will polish after cutting.

Limpet, a marine mollusc with a single-valved shell, generally found sticking close to sea-washed rocks.

Linen, a textile fabric manufactured from flax fibre, known to the ancient Egyptians, and first manufactured in England under Henry III. by Flemish weavers. The chief seat of the manufacture is Ulster, with Belfast as the centre.

Dunfermline (famous for its damasks) and Manchester are also large linen-producing towns.

Ling, a sea-fish common on the coasts of Britain, and abounding in more northern waters. It averages from 3 to 4 ft. in length, and is a voracious feeder, living chiefly on small fish. Ling is also the name applied to *Calluna vulgaris*, the plant which most people called "heather."

Linseed, the seed of the flax plant, containing, apart from its fibrous substance, certain oily and nitrogenous matter of considerable commercial value. This yields linseed oil, and what is left is converted into cattle food.

Lion, the most impressive of the Cat tribe (Felidæ) of the order Carnivora. It is chiefly found in Africa, being comparatively rare in Asia. Its large square head, its flowing mane (in the males only), and its tufted tail distinguish it. From tip to tip it can reach a length of 10 ft.; a weight of 500 lb.

Lion and Unicorn, the supporting figures of the royal arms of Great Britain, date from the union of Scotland with England at the accession of James I. (James VI. of Scotland), the lion representing England and the unicorn Scotland.

Liqueurs are essences combined with alcoholic liquid, and are of many kinds, named according to their flavourings or place of production, and include Maraschino, Chartreuse, Curacoa, Benedictine, Noyau, Kümmel, etc.

Liquid, the name given to matter in such state that it takes its shape from the containing vessel. The volume it occupies is independent of the container, however. *See* **F16**.

Litanies were first used in church processions in the 5th century. The first English litany was commanded to be recited in the Reformed churches by Henry VIII. in 1545.

Lithium, a silver-white metallic element discovered by Arfvedson in 1817. It is softer than lead. Its main ores are lepidolite, spodumene, amblygonite.

Lithography, the art of drawing on stone and printing therefrom, was discovered by Alois Senefelder about 1796, and was introduced into England a few years later. Many improvements in the art have been made in recent years, especially in chromo-lithography and photolithography.

Litmus, a special kind of colouring matter produced from certain lichens. The resulting colour is violet; is turned red by acids and blue by alkalis.

Litre, a French measure both for liquids and dry articles. In the former measure it is equal to 1·76 imperial pints; in the latter to a cubic decimetre.

Liturgy, the name given to the Church ritual, though strictly applying only to the portion used in the celebration of the Eucharist. The present English liturgy dates from 1547–48, when it received the approval of Parliament.

Liverworts (Hepatics), plants related to the mosses and belonging to the second most primitive subdivision of the Plant Kingdom. There is no differentiation into stem and leaves. Liverworts are most common in damp situations, such as the banks of ditches.

Livre, an old French coin, the equivalent of the present franc. Not current since the end of the 18th century.

Lizard, the name given to a diversified order of reptiles, of which there are about 1,600 species. Included among the lizards are the geckos, chameleons, glass snakes, skinks, and blind worms.

Llama, mammals related to the camels, from which they differ in small size, absence of humps, and more woolly coat. The domestic llama of S. America is used as a beast of burden, also providing wool, meat, and milk.

Loach, a fresh-water fish, a common habitant of British rivers and streams. It has several barbels around its mouth, and is of a darkish-green colour on the back, with darker stripes and spots.

Loadstone *or* **Lodestone**, an oxide of iron, found chiefly in Sweden and Norway. Its scientific name is magnetite. It has the power of attracting pieces of iron and served as the first magnets used in compasses.

Loam, soil composed of clay and sand in such proportions as to keep the ground porous.

Lobby Correspondents are political correspondents of newspapers who do not report the actual proceedings of Parliament—this is done by Parliamentary Correspondents—but interpret political news and events.

Lobsters are marine crustacean animals existing in large numbers in the northern seas of Europe and America, and in fair proportion on some parts of the British coasts, especially in the neighbourhood of the Channel Islands.

Locarno, Treaty of, 1925, whereby Germany, France, and Belgium undertook to maintain their present frontiers and to abstain from the use of force against each other. Hitler broke the pact by re-occupying the Rhineland, the demilitarisation of which had been recognised by Germany.

Locust, insects of the grasshopper family, but much more powerful. They are inhabitants of hot countries, and often make their appearance in untold millions, like clouds, devastating all the vegetation that comes within their course. The locust-tree (*Ceratonia siliqua*) is supposed to have furnished food to St. John the Baptist in the wilderness, and its "beans" have accordingly been styled "St. John's Bread."

Loess, a deposit of silt or marl laid down by wind action. The biggest loess deposits are in Asia, the source of the dust of which they are composed probably being the deserts of Central Asia.

Log, a line used for reckoning the speed at which a ship is travelling. It was first used in the 16th century. The line is divided into spaces of 50 ft. marked off by knots and measured by a half-minute sand glass, bearing the same proportion to an hour as 50 ft. bear to a mile.

Logarithms, a system of calculation invented by John Napier in 1614, and developed by Henry Briggs a few years later. Thus if a number is expressed as the power of another number, *i.e.*, if $a = b^n$, then n is said to be the logarithm of a to base b, written $\log_b a$. Common logs are to base 10 and Napierian to base 2·7182818 . . ., expressed as e. Their use represents a great saving of time.

Logical Positivism, a school of philosophy founded in Vienna in the nineteen-twenties by a group known as the Vienna circle; their work was based on that of Ernst Mach, but dates in essentials as far back as Hume. Of the leaders of the group, Schlick was murdered by a student, Wittgenstein came to Britain, and Carnap to America following the entry of the Nazis. Briefly, the philosophy differs from all others in that, whilst most people have believed that a statement might be (*a*) true, or (*b*) false, Logical Positivists consider there to be a third category. A statement may be meaningless. There are only two types of statement which can be said to have meaning: (1) those which are tautological, *i.e.*, those in which the statement is merely a definition of the subject, such as "a triangle is a three-sided plane figure" ("triangle" and "three-sided plane figure" are the same thing), and (2) those which can be tested by sense experience. This definition of meaningfulness excludes a great deal of what has previously been thought to be the field of philosophy; in particular, it excludes the possibility of metaphysics. Thus the question as to whether there is a God or whether free-will exists is strictly meaningless, for it is neither a tautological statement nor can it be tested by sense-experience.

Lollards, a body of Reformers who, under the leadership of Wyclif, were subjected to cruel persecution in the reign of Richard II. Sir John Oldcastle was a prominent Lollard, and was burned at the stake.

Lombards, the name given to a community of Italian merchants who settled in England in the 13th century and first became prominent as moneylenders and later as bankers. Lombard Street derives its name from them.

London Clay, geological stratum which outcrops in various parts of London, notably at Highgate. It represents the lower stratum of the Eocene. Outside the metropolis, brickfields utilise the clay for brickmaking. Water held above this impervious stratum is tapped by a number of artesian wells in London. The tunnels of the Captial's underground railways run through the London Clay.

Londonderry, Siege of, by James II.'s army in 1689, lasted 105 days. The garrison and inhabitants were driven to famine, but held on until the siege was raised.

London University comprises nearly one-third of the academic activity of the United Kingdom, and is recognised as one of the great universities of the world. Originated in the foundation of a non-sectarian college in Gower Street in 1828. Among the chief colleges are: University, Kings, Imperial College of Science and Technology, London School of Economics, School of Oriental and African Studies, Queen Mary, Birkbeck, and the 4 women's colleges, Royal Holloway, Bedford, Westfield, and Queen Elizabeth College. London University was the first to throw open all degrees to women (1878).

Long Distance Routes. The National Parks and Access to the Countryside Act 1949 provided for the establishment in England and Wales of Long Distance Routes for walkers and where possible for horse riders. The first routes chosen were the Pennine Way (a magnificent hill walk of 250 miles from Edale in Derbyshire along the Pennines over the Cheviots to the Scottish border); the Cornwall and Pembrokeshire coasts; and Offa's Dyke which runs some 168 miles along the marches of Wales. Surveys are also being made of a way from Beachy Head to Salisbury; the Pilgrim's Way; and a walk over the Chiltern and Berkshire Ridges, the Marlborough Downs and so to Seaton. (*See also* **National Parks.**)

Longitude of a point on the earth's surface is the angle which the meridian through the poles and that point makes with some standard meridian. The meridian through Greenwich is usually accepted as the standard meridian and the longitude is measured east or west of that line. As the earth revolves through 360° in 24 hrs., 15° longitude represent 1 hour's difference in apparent time.

Long Parliament (1640–60), marked the end of Charles I's 11-year attempt to govern without parliament. It carried through what has come to be called " the English Revolution " and was the parliament of the civil war (1642–49).

Lord, a title of honour held by such as are peers of the realm, and bestowed on persons who have achieved distinction or inherited by descent. It is also borne by Bishops, on spiritual and ecclesiastical grounds, and is accorded as a courtesy to the eldest sons of dukes, marquises, and earls, to the younger sons of dukes and marquises, and to Judges of the High Court in England and Scotland.

Lord Lieutenant is the Queen's representative in the county, and his office is now largely ceremonial. On his recommendation the magistrates or Justices of the Peace are appointed by the Lord Chancellor. The office was created by Henry VIII. in 1549 to take over the military duties of the sheriff.

Lords, House of, the Upper House of the British Parliament composed of Lords Spiritual and Lords Temporal. The former consist of the Archbishops and twenty-four English Bishops and the latter of Peers. The full membership is about 800. The right of the Lords to veto Bills passed by the Commons is restricted by the Parliament Acts of 1911 and 1949. The Lord High Chancellor presides over the House of Lords. (*See* **C7** (2) for an account of the limitation on its power of veto, *also* **C10**.)

Louis d'Or, a French gold coin of the value of 24 francs, first issued by Louis XIII. in 1640, but superseded by the Napoleon, or 20-franc piece.

Louse, parasitic insect found on the skin of birds and mammals. The bird or biting lice make up one order (*Mallophaga*); the true or sucking lice belong to another order, called *Anoplura*. Two species of lice parasitise man, and one of these, the body louse, is a carrier of typhus.

Louvre, one of the old royal palaces of Paris, was built in its present form partly by Francis I., and added to by later monarchs, Louis XIV. completing the edifice. Napoleon I. turned it into a museum and enriched it with the plunder of many foreign art galleries. The great extension to the Louvre building begun by Napoleon I. was completed under Napoleon III. in 1857. Much injury was done to the building during the Commune of 1871. Amongst other famous treasures it houses the Venus de Milo and Leonardo da Vinci's masterpiece, " La Gioconda."

Lovebird, a vivid little bird native to Africa, resembling a parrakeet but with a short, wide tail and short body. Lovebirds build nests, parrakeets do not.

Luddites, a combination of workmen formed in 1811, in a period of great distress, with the object of destroying the new textile machinery then being largely adopted, which they regarded as the cause of their troubles. Their first outbreak was at Nottingham, and was stated to have been started by a young apprentice named Ned Ludd. Afterwards, serious Luddite riots occurred in various parts of the country, especially in the West Riding of Yorkshire, where many people were killed, mills were destroyed, and numbers of rioters were tried and executed. Charlotte Brontë used the period in her novel, *Shirley*.

Luniks, the name of the Soviet moon rockets. *Lunik I*, launched 2 Jan. 1959, with payload of 800 lb. and max. velocity of 25,500 m.p.h., entered a solar orbit between Earth and Mars to become the first man-made planet. *Lunik II*, launched 2 Sept., 1959, with payload of 860 lb., and max. velocity of 25,500 m.p.h., landed on the moon. *Lunik III*, launched 6 Oct. 1959, with payload of 613 lb. and max. velocity of 24,500 m.p.h., circumnavigated the moon and took a photograph of its hidden side which it televised back to Earth. *See also* **F49** (2).

Lunar Month, the period in which the moon makes its revolution around the earth—about 29½ days.

Lung Fishes *or* **Dipnoi.** In these fishes an air bladder, which can be filled with air gulped in through the mouth, functions as a lung. This method of breathing enables them to survive in the muddy bottom of dried-up streams and swamps. They occur in Australia, Africa, and S. America.

Lupercalia, yearly festivals held in ancient Rome in honour of Pan.

Lute, a stringed instrument of the guitar type of unknown antiquity. Its name is Arabian. Lute music was very popular in England in the 17th century. There has been a revival in this century.

Lutecium, element of the rare-earth metal group discovered in 1907 by Urbain.

Lynch Law is the dealing out of summary punishment to offenders by private individuals without appeal to the law. It is said to get its name from one Charles Lynch, a Virginian planter, who in the latter part of the 18th century was accustomed to take into his own hands the punishment of offenders. Instances of lynch law have been frequent in the United States, and generally result in the carrying out of a rough and ready death sentence, negroes often having been the victims.

Lynx, cats of sturdy build, with tufted ears and spotted fur, inhabiting many parts of the world, including Northern and Central Europe. They commit serious ravages among sheep and goats and are very fierce.

Lyon King of Arms, the President of the Scottish Lyon Court, and head of the heraldic organisation for Scotland.

Lyre, an upright stringed instrument rather like a miniature harp. It was the universal musical instrument of classical Greece and Rome.

Lyre-Bird, a remarkable genus of Australian birds, the males of which possess a beautiful lyre-shaped tail. The bird is not more than 15 in. long, but its tail, which it displays to advantage during its remarkable courtship dance, is 23 in. in length.

M

Macadamising, the system of road-making invented by John Macadam (1756–1836). The road bed is laid with hard broken stones, of a nearly uniform size, which by the weight of the traffic alone soon assume firmness. Nearly all the main country roads are macadamised.

Macaque. A family of monkeys which include the Barbary ape (specimens of which live on Gibraltar), the Rhesus macaque (the organ grinder's monkey and the one used for experimental work in the investigation of disease), the Bonnet monkey of southern India and

Ceylon, the Crab-eating, and the Pig-tailed monkeys of south-eastern Asia.

Macaw, a genus of large parrots with brilliant scarlet and sky-blue plumage, with interminglings of green. Native to South and Central America.

Maccabees, a patriotic Jewish family whose achievements in early history were very notable. The revolt of the Maccabeans in the 2nd century B.C., in which Judas captured Jerusalem and purified the Temple, is the most famous exploit connected with this historic name. The feast of the Maccabees is celebrated with rejoicing in December.

Mace, originally a weapon of offence, now an ensign of authority borne before officers of state and other dignitaries. At the present day, among others, there are maces for the Speaker of the House of Commons, the Lord Mayor of London, and other mayors. The mace-bearer is the functionary who on ceremonial occasions carries the symbol of authority before judges and civic or state officials.

Macedonians, a sect formed by Macedonius, Bishop of Constantinople, in the 4th century, who denied the existence of the Holy Ghost. The Papal Council expelled the bishop and his followers from the Church in 360.

Mach Number. Unit of high-speed flight. The ratio of speed of flight to speed of sound under same conditions of pressure and density. Speed of sound at sea-level is 762 m.p.h., so flight speed of 381 m.p.h. is equivalent to a Mach Number of ½. At supersonic speeds the Mach Number is greater than 1; subsonic speeds, less than 1. *See* **F69** (1).

Machinæ Organa, defined in the 10th book of Vitruvius as "contrivances for the concentration and application of force," and known by the names of instruments, engines, and machines.

Mackerel, a familiar sea-fish existing in large numbers in the northern waters of both hemispheres. In May and June immense shoals are to be found round the British coasts.

Madder, one of the most important of dye-stuffs, largely used in producing Turkey-red dye, but now superseded by artificially prepared alizarin. Natural madder is the root of the *Rubia tinctorum*.

Mad Parliament, held in 1258 at Oxford to settle the differences between Henry III, and his barons. It resulted in the Provisions of Oxford, which provided for an advisory council of fifteen for the king that was to meet twelve representatives of the barons three times a year for consultation. The plan was operative until the rising of the barons under Simon de Montfort in 1263.

Madrepore, a white coral-like substance consisting of carbonate of lime, formed by the gradual growth of polyp deposits, and abounding in tropical seas.

Madrier, a term in military engineering denoting a beam laid in a ditch to support a wall, or in a mine to hold up the sides or roof: also an armoured plank affording protection against hostile fire, or fitted to receive the mouth of a petard in attacks upon obstacles.

Madrigal, a style of unaccompanied composition for three or more voices. Developed in the Netherlands, it reached perfection in 13th-century Italy. Brought to England during the Renaissance it achieved great popularity and many English composers became famous for their madrigals.

Madwort, a common name of the botanical genus alyssum.

Maelstrom, a great whirlpool. The most famous is that off the coast of Norway, between the islands of Moskenës and Mosken, of the Lofoten group, the power of which has been much exaggerated.

Mafia, a secret Sicilian society formed for purposes of vengeance, private and public, prominent about 1860, and again after the second world war.

Magenta, an aniline dye discovered in 1859 by Sir W. H. Perkin, and named after the great battle of that year between the French and Austrians.

Magi, priests of the Persian fire-worshippers. Their sacred fires blazed in the open air, and around them they performed their mystic rites. Zoroaster, their great reformer, flourished about 615 B.C. It was not till thirteen centuries later that Parseeism in Persia was superseded by Mohammedanism, and the only representatives of the old worship now left are the Parsees of India.

Magic, a term applied to the pretended art of influencing the course of events by supernatural means. According to some a primitive stage of belief in magic precedes the establishment of religion. Magic has been practised in all countries and in all ages. The priesthood of ancient Egypt was notably proficient in these arts, and much early ritual seems to have been magical in intent, including the rite of sacrifice. The powers of the gods themselves are often attributed to magic in Egyptian, Babylonian, Vedic and other mythologies The practice of magic continued in Europe during the Middle Ages in spite of the efforts of the Church. Magic took various forms—the cure of disease, predictions, and the gratification of personal desires. Thus, there was *black magic*, which communed with evil spirits; *white magic*, dealing with good spirits; and *natural magic*, the science of the occult; while *astrology* and *alchemy* were the advanced outcome of these superstitions. In a primitive state of culture when conditions are difficult and knowledge limited, man in his despair resorts to magical practices to bring about his desires.

Magic Lantern, an apparatus for throwing pictures on a screen, invented by Kircher in the 17th century, and consisting of a lantern, behind the light of which is a reflector, while in front is a tube carrying a condensing lens, this being supplemented by a double convex lens which enlarges the object to be shown.

Magistrates *or* **Justices of the Peace** preside over courts of petty sessions, and are appointed by the Lord Chancellor on the recommendation of the Lord Lieutenant of the County. There are some 25,000 magistrates in Britain, of whom about 1,000 are women. They are unpaid. Mayors during their time of office at J.P.s *ex officio*. In certain big towns a barrister known as a stipendary magistrate is appointed to act as full-time salaried magistrate. There are 28 stipendaries in London known as Metropolitan Police Magistrates. *See* **C11** (1).

Magna Carta was sealed by King John at Runnymede on June 15, 1215, in obedience to the insistent demands of the barons, and has been confirmed many times by later monarchs. It was not a revolutionary document. It laid down what the barons took to be the recognised and fundamental principles for the government of the realm and bound king and barons alike to maintain them. Its main provisions were that no man should be punished without fair trial, that ancient liberties generally should be preserved, and that no demands should be made by an overlord to his vassal (other than those recognised) without the sanction of the great council of the realm.

Magnesium, a metallic element, first isolated in 1808 by Sir Humphry Davy, who prepared it by electrolysing the chloride. Its chief ores are magnesite and dolomite. Industrially it is obtained by electrolysis. Many important light alloys contain magnesium. The metal burns with a very bright light, and for this reason it is used in photographers' flash bulbs and also in firework manufacture.

Magnetic Poles are at a considerable distance, of the order of 1,000 miles, from the geographical poles, and are not antipodal to one another. The poles do not remain fixed, and the North pole wanders more than the South. The position of the North magnetic pole is in the region of lat. 74° N.; long. 100° W., considerably north of Amundsen's observations of 1904. The South magnetic pole is not far from lat. 70° S.; long. 150° E.

Magnetic Storms, large irregular disturbances superimposed upon the normal magnetic field of the earth. They may occur at any time, but are most frequent during equinoctial months and in years of sunspot maxima. World-wide in extent, magnetic storms are most pronounced in the polar regions, being due apparently to intense electric currents located in the upper atmosphere near to the zones of greatest auroral frequency. One theory attributes the high ionisation of these

belts to solar radiation. Magnetic storms cause radio fade-outs and interfere with telegraphic communication.

Magnetism, the quality of attraction for iron possessed by the lodestone or magnet-stone, was known to the ancient Greeks, Chinese, and Arabians. Later, perhaps about the time of the Norman Conquest, it was discovered that lodestone or magnetised iron, if freely suspended, sets itself north and south. This discovery led to the invention of the mariner's compass. Basic law of magnetism is "like poles repel, unlike poles attract," and this was formulated by Peter the Pilgrim in 1269. The earth acts like a huge magnet with its axis inclined at about 10° to the axis of rotation, the magnetic poles being on the Boothia Peninsula (North Canada) and South Victoria Land (Antarctica). The magnetic field at the surface consists of the regular field of a magnetised sphere with an irregular field superimposed upon it. Variation in the magnetic forces occurs from place to place and from time to time, and maps showing the distribution over the globe of points of the same declination (*i.e.*, the angle which the magnetic meridian makes with the geographical one) are of the utmost importance in navigation. In the south-east of the British Isles, at present, a magnetic needle points 9° and in the north-west 14° west of true north. Little is known regarding the origin of the main (regular) field of the earth, but it is believed that most of the irregularities are due to the presence of intense electric currents in the upper atmospheres. *See* **F17–18.**

Magnificat, the hymn of the Virgin Mary, given in Luke 1, 46 beginning in the Vulgate with the words "Magnificat anima mea Dominum" ("My soul doth magnify the Lord"), and used in the services of all Christian Churches.

Magnitude in astronomy is a measure of the apparent brightness of a star, which is inversely proportional to the square of its distance. A low number indicates a bright star, and a high one a faint star. The *absolute magnitude* is a measure of *real* brightness, *i.e.*, the brightness a star would have at a standard distance away of 32·6 light years. The distance can be calculated if the apparent and absolute magnitudes are known.

Magnolia, the type of the botanical family *Magnoliaceæ*, comprising many beautiful trees, and shrubs with large and fragrant flowers, and chiefly native to North America and Asia.

Magpie, a well-known bird of the crow family, of glossy black and white plumage, famed for its mischievous propensities.

Magyars, the Hungarian race who came to eastern Europe from S.W. Asia and settled in Hungary in the 10th century. Their language belongs to the Finno-Ugrian group.

Mahdi, an Arab leader of great influence, invested with powers akin to those of a Messiah in the Mohammedan mind. The title was taken by Mohammed Ahmed, who overran the Egyptian Sudan, and in 1885 captured Khartoum.

Mahogany, a fine hard wood susceptible of a very high polish, and distinguished for the beauty of its colour and markings. The tree which produces this wood (*Swietenia mahogani*) is a native of the West Indies and tropical America. Mahogany is said to have been first brought to England by Raleigh in 1595.

Mahrattas, a warlike people strongly opposed to the East India Company in the 18th and early part of the 19th centuries, but subdued in 1818.

Maidenhair Tree *or* **Ginkgo.** This tree takes its name from the shape of its leaves, which resemble those of the maidenhair fern. Widely cultivated in China and Japan. It is the only survivor of an order of gymnosperms which flourished in Mesozoic times. Botanically remarkable in that the pollen tube contains two sperms which are motile.

Mail-Coaches, which are usually regarded as things of a very distant past, did not come into existence till 1784, when Mr. John Palmer, of Bath, put the first mail-coach on the road between Bath and Bristol. They were soon afterwards adopted in other parts of the kingdom, and were employed in carrying the mails until superseded, in great part, by railways. The present mail vans carry no passengers.

Maize, an important cereal largely grown in U.S.A., Argentine, Rumania, China, India, and Union of S. Africa, commonly known as Indian corn in the U.S.A.

Majolica, a kind of pottery carrying a highly coloured glaze or enamel, supposed to have been introduced into Europe by the Moors from Majorca, in the 15th century, and brought to a high degree of artistic beauty in those days. Raphael and other great artists made designs for the ware. After the 16th century majolica production practically ceased, though in recent times some clever imitations of the old ware have been manufactured.

Major Scale. (*See* **Diatonic Scale.**)

Malacostraca, the sub-class of the Crustacea to which the lobsters, crayfish, shrimps, belong.

Malays, a race of people with oblique eyes, high cheek bones, and brown skin, whose native countries are Malaya, Polynesia, the Philippines, and Madagascar.

Malmaison, château at Rueil-Malmaison, a western suburb of Paris. It derives it name from having been inhabited in the 11th century by the Norman brigand Odon, and afterwards, according to the tradition, by evil spirits, exorcised by the monks of St. Denis. It was the residence of Napoleon and of the Empress Josephine after her divorce. She died there in 1814 as the result of a chill caught while showing the Russian Emperor round the grounds. In 1900 it was given to the nation.

Malmsey, a strong, sweet wine originally made in Greece, but now also in Spain, Madeira, and the Azores; known also as Malvoisie.

Malt is barley grain which has gone through a steeping and preparing process to render it suitable for brewing purposes. It was for a couple of centuries subjected to a fluctuating duty, producing in 1863 a sum of £6,273,727. The tax was abolished in 1880.

Maltose, a sugar formed in cereal grains during germination. It is produced by hydrolysis of starch, and further hydrolysis converts the maltose into glucose.

Mamluks, commonly known as Mameluks, were originally—in the 13th century—a bodyguard of Turkish and Circassian slaves in the service of the Sultan of Egypt, and attained such influence that in 1250 they were strong enough to appoint one of their own body to the throne of Egypt. After that a succession of Mamluk Sultans reigned down to 1517. Then the Turks annexed Egypt, and the Mamluks were taken into the service of the Beys. They again came to the front after Napoleon's conquest of Egypt, and for a time resumed governmental sway; but in 1811 they were decoyed into the citadel of Cairo and massacred by order of Mehemet Ali.

Mammalia, a zoological term covering all that portion of the animal kingdom, the females of which are provided with mammary glands for suckling their young. A further characteristic is the double articulation of the skull with the vertebral column. *See* **F25** (1).

Mammoth, extinct elephants of gigantic size. In 1799 the first perfectly preserved specimen was found in Siberia in a block of ice. It was in prehistoric times an inhabitant of Britain and other parts of Europe, as well as of Asia and America.

Mammoth Cave of Kentucky, about 10 miles long, is one of a series of spacious caverns formed in the limestone rock formation, and is from 40 to 300 ft. wide and at one point 300 ft. high. Stalactites and stalagmites abound.

Manatee, an aquatic mammal of the sea cow (Sirenia) order of mammals, averaging when full grown from 10 to 12 ft. in length, with shovel-shaped tail, and four limbs and nails which almost give the appearance of arms and hands. In spite of their ungainly aspect, these creatures are believed to have given rise to the legend of mermaids.

Manchus, the original nomadic race inhabiting northern Manchuria who invaded China early in the 17th century. A Manchu dynasty occupied the imperial throne of China from 1644 to 1911.

Mandamus, a writ of command issued from the Queen's Bench Division of the High Court addressed to any person, corporation, or inferior

court requiring them to do something which appertains to their office.

Mandarin, the name given to a powerful Chinese official, civil or military under the old régime, whose rank was shown by the wearing of a button on the cap. In Chinese the name is Kwan.

Mandible, the lower jaw in human anatomy. The two parts of a bird's beak are known as the upper and lower mandible. The term is also used for biting jaws in arthropods.

Mandoline, an Italian fretted guitar, so called from its almond conformation.

Mandrel, a cylindrical bar or spindle used for a variety of purposes in engineering.

Manganese, a metallic element discovered by Scheele in 1774. It is silver-white, not very hard (it forms a hard alloy with carbon), brittle, and tarnishes when exposed to air. Its chief ore is pyrolusite (manganese dioxide). Steels containing manganese are very tough, and used for making machine parts.

Manikin, a dwarf or pigmy; an artificial figure employed in anatomical demonstrations, made sometimes of papier-mâché.

Maniple, eucharistic vestment worn over left arm.

Manna, a tree of the ash genus growing in the South of Europe and in the East, and exuding a sweet substance which is gathered, boiled, and eaten.

Manometer, instrument used to measure gas pressure. Usually a U-tube containing water or mercury, one end open to the atmosphere, the other to the gas whose pressure is to be measured. More sensitive for small pressures than the Bourdon gauge.

Manors were estates originally granted in Anglo-Saxon times as rewards for knightly service, and included the privilege of a special court with jurisdiction, criminal and civil, within the manorial territory. (*See* **Court-Leet.**)

Mansion House, the official residence of the Lord Mayor of London, stands opposite to the Bank of England, and was erected in 1739–53 from the designs of George Dance.

Mantis. Large insects belonging to the same order as the locusts and grasshoppers. The manner in which the forelegs are held, as though in suppliance, has gained for these insects the common name of "praying mantis." They are distributed throughout the warmer countries of the world.

Manuals, the keyboards of an organ which are operated by the hands as apart from the pedals which are worked by the feet. In a large organ there may be four manuals, each controlling a group of stops. These groups are called great organ, swell organ, choir organ, solo organ.

Manx, the original Celtic inhabitants of the Isle of Man, where a Celtic dialect still lingers.

Maoris, the race found in New Zealand at the time of its discovery by Europeans. The Maoris are believed to have migrated from Polynesia about 1350. They number 155,546 (1959), and being very intelligent people have adapted themselves with considerable success to the conditions of civilised life. Until 1870 they were frequently in arms against the Government, but since then have settled down with the Whites as equal citizens.

Maple, trees native to the northern hemisphere. There are over 100 species. The sycamore is the best-known species growing in Britain. The sugar maple abounds in Canada and the eastern parts of the United States. The sugar is tapped by boring holes in the tree in Feb. and Mar., and the juice that escapes is collected and evaporated. The maple-leaf is the Canadian national emblem.

Maquis, name of the dense scrub in Mediterranean France and Corsica, providing good cover for bandits and outlaws. The French resistance movement adopted the name Maquis during the German Occupation, 1940–45.

Marabouts, Mohammedan hermits or monks, especially amongst the Moors and Berbers of N.W. Africa. They live in monasteries or attached to mosques and are held in great veneration by the Berbers.

Marble is limestone in its hardest and most crystalline form. There are many varieties—33 were used in the building of the Paris Opera House—but white is the purest and rarest. From about 568 B.C. white marble was used by the Grecian sculptors for their statues. Rome was rich in marble buildings and monuments, and Palmyra was mainly built of white marble. Devonshire and Derbyshire yield the best English marbles, and several localities in Ireland furnish particular kinds. Vermont, Massachusetts, and Tennessee are the chief marble-producing States of America. The American marbles are mostly light grey. The Marble Arch, at the northern entrance to Hyde Park, was originally built for the front of Buckingham Palace.

March, the third month of the year, and the first of the old Roman Calendar. It was named after the god Mars, and was the *Hlyd* (storm) *monath* of the Anglo-Saxons.

Mardi Gras, the last day of the Carnival in France, Shrove Tuesday.

Mares' Tails, term popularly applied to high (cirrus) cloud when it appears in tufts or feather-like plumes.

Mariner's Compass. (*See* **Magnetism.**)

Mariolatry, a term applied by non-Catholics to the worship (hyperdulia) of the Virgin Mary, began in the 4th century, and still a prominent part of Roman Catholic religious observances.

Marionettes are puppets moved by strings. They originated in the *Fantoccini* of the 15th century which had such vogue in Italy and are still popular, being adopted in Germany and England later. Our *Punch and Judy* is a version of Punchinello.

Marl, a rock composed partly of clay and partly of carbonate of lime or magnesia. Usually grey in colour.

Marlinspike, a pointed iron tool used by sailors to splice wire. The instrument used when rope splicing is called a fid.

Marmoset, small monkeys confined to the New World. Very squirrel-like in appearance, with long bushy tails, and thick woolly fur, they are pretty little animals and the smallest of all monkeys. There are claws, not nails, on their digits, the big toe excepted.

Marprelate Tracts, seditious pamphlets written with great maliciousness by a group of Elizabethan puritans about 1586, and intended to discredit the episcopacy, caused a great sensation in their time, and led to the execution of their supposed author, John Penry.

Marquess *or* **Marquis,** the title next in precedence to that of duke. The first English marquess was Rovery de Vere, Earl of Oxford, who had the honour conferred upon him by Richard II. in 1385.

Marquetry, a kind of inlaying in which thin layers of coloured woods are wrought into a design, and mainly used in ornamental floors.

Mars, the fourth nearest planet to the sun, being 141,500,000 miles distant. Its diameter is 4,215 miles as against the earth's 7,920. There has been much speculation about certain dark lines which some observers have seen on the surface of Mars; photographs give no support to the theory of an artificially constructed network of canals, but it is possible they represent areas covered by some simple form of vegetation of the lichenous type. The temperature of the planet's surface would allow living organisms as we know them to exist, but the quantity of oxygen in the atmosphere would be almost certainly too little to support animal life.

Marseillaise, the French national hymn, written and composed by Rouget de L'Isle, a French engineer officer, who was inspired to write it in 1792 to encourage the Strasburg conscripts. It immediately became popular, and received its name from the fact that it was sung by the Marseillaise troops while marching into Paris.

Marshalsea Prison, a once well-known house of detention in Southwark. It stood near St. George's Church, and was originally a prison for royal servants convicted of offences, but from 1842 to 1849 was a debtors' prison. It was abolished in 1849. Dickens described it in *Little Dorrit.*

Marsh Gas. (*See* **Methane.**)

Marsh Tortoise, an amphibious animal of the order *Chelonia,* spread over many countries and inhabiting ponds and small rivers. There are 42 species, and they are all carnivorous.

Marston Moor, near York, was the scene of the famous battle between Prince Rupert and his

forces against Cromwell and his troops on July 2, 1644. Cromwell was victorious, and this formed the turning-point in the Civil War.

Marsupials, mammals having a marsupium or pouch; the young are born of comparatively small size and imperfectly developed, but are transferred to the maternal pouch. Except for the oppossums of America, all marsupials occur in Australasia. Well-known marsupials are the kangaroos, wallabies, and wombats.

Martello Towers, circular forts erected on the coasts of England early in the 19th century as defences against the threatened Napoleonic invasion. So called from the circular fort at Mortella (Corsica), which resisted an English fleet in 1794.

Marten, carnivorous animals of the weasel family, one species of which was once common in Britain, but now seldom met with. Many valuable furs come from martens, *e.g.*, the sable of N. Asia and the marten of N. America.

Martial Law is a term loosely employed to indicate the suspension of the administration of normal civil law and its replacement by military authority when this is rendered desirable by such circumstances as war or rebellion.

Martin, a well-known bird-visitor to Britain. It belongs to the swallow family, and the two species that spend their summers here are the house-martin, which makes its nest of mud under the eaves of houses, and the sand martin, which builds in sandy banks.

Martingale, a long strap or thong of leather, one end of which is fastened to the girth of a horse, between the fore legs, and the other to the bit, or to a thin mouthpiece of its own.

Martinmas *or* **St. Martin's Day**, falls on Nov. 11, and is one of the Scottish quarter days. St. Martin was a popular Saint with our ancestors, and Martinmas was a busy time for the mediæval housewife. It was the date when "Martlemas Beef" was dried in the chimney, and enough bacon and mutton cured to last until the spring, because, owing the the scarcity of winter fodder, fresh meat could seldom be obtained. This diet of dried meat without vegetables caused scurvy, King's evil, leprosy, and other maladies. Originally the goose belonged to Martinmas, not to Michaelmas, the legend being that when Martin was elected Bishop of Tours he hid himself, but was betrayed by the cackling of geese. He died in the 4th century. The spell of fine weather sometimes occurring at Martinmas is called St. Martin's Summer.

Martyrs. People who suffer death in testimony to their faith. Stephen was the first Christian martyr in 39. The first English martyr was St. Alban, 286, and in Tudor times many eminent churchmen went to the stake at West Smithfield, in London, and at Oxford, where now exists the "Martyrs' Memorial." There is a Martyrs' Memorial Church in St. John St., Clerkenwell, not far away from the scene of the Smithfield fires.

Marxism. The doctrine formulated by Karl Marx and Friedrich Engels about the middle of the 19th century and the basis of modern Communist theory (with the new addition of the works of Lenin and Stalin). Marxist thought was strongly influenced by that of Hegel, but the Idealism of Hegel was transformed into the Materialism of Marx and Engels. The most important aspect of Marxism is its interpretation of history, which is seen as the history of class struggles according to the law of the dialectic described by Hegel. (*See* **Idealism.**) Thus the Feudal System with its land-owning aristocracy was thesis to the antithesis of the rising merchant class, and the result (synthesis) was the modern capitalist system, which in its turn will be thesis to the working-class's antithesis leading to the classless society. Differing ideologies and, in fact, differing cultures, all are produced by the economic relations within a society; thus all ideologies are a form of propaganda for the ruling class. (*E.g.*, Darwin's theory of the struggle for existence was a justification of the capitalist's attitude to the working-class.) Marxism also implies an economic theory based on the concept of surplus value, and is applied to physics, biology, and all other sciences in the form of dialectical materialism. Although the work of Marx has led to a greater understanding of society and contains much truth, few other than Communists accept the theory wholeheartedly. Anthropologists accept that the material and technological structure of a society influences the ideologies and the way of life of the individuals within it, but they would not agree that it completely determines them. Furthermore, they point out, most societies have not been arranged on a class basis.

Mason and Dixon's Line is the boundary line separating the old Slave States of America from the Free State of Pennsylvania. It was drawn by two English surveyors, Charles Mason and Jeremiah Dixon, between 1763 and 1767.

Masquerades are balls or dances at which those who take part appear masked or in character. Edward III. was fond of this type of entertainment. Pepys and Evelyn mention a masquerade held at Whitehall on Feb. 2, 1665. This form of revel became a craze in London at the beginning of the 18th century. In modern times it survives in the fancy dress ball.

Masques were light dramatic compositions set to music and performed on special occasions. One of the best-known examples is Milton's "Comus," which was given at Ludlow Castle in 1634.

Mass, the service in the Roman Catholic Church in which are enacted and enshrined Christ's words and actions at the Last Supper. It is high or low, *i.e.*, performed with full choral service, or merely by the rehearsal of prayers without singing. Mass was first celebrated in Latin in the 4th century, and was introduced into England in the 7th century.

Mass Spectrograph, an instrument for separating isotopes. It works by sorting electrified particles according to their masses; the particles stream through a magnetic field, and the lightest particles undergo the greatest deflection.

Massorah, a collection of criticisms on the Hebrew text of the Scriptures, and rules for its correct interpretation.

Mast, a long round piece of timber or tubular steel or iron, standing upright in a vessel, and supporting the yards, sails, and rigging in general. The earliest ships had only one mast, carrying a simple sail. The number increased until there were 4 or 5, or even more. Above the lower mast of a sailing-ship comes the topmast, and above that, the topgallantmast and royalmast. The position of each mast is indicated by a prefix, as foremast, foretopmast, foretopgallantmast, foreroyalmast, mainmast, maintopmast, etc. The foremast is in the fore of the ship, the mainmast in the centre, and the mizzen nearest the stern. In large vessels nowadays the mast does not extend to the keel, as it formerly did, but is usually stopped at the second deck.

Master of the Revels was an important Court official upon whom devolved the arrangement of Court festivities. The office is at least as old as the time of Edward III. By 1737 it seems to have died.

Master of the Rolls, one of the English judges, formerly a judge of Chancery, but since 1881 a judge of the Court of Appeal only. In addition he has charge of the rolls or records of Chancery and ranks next to the Lord Chancellor and Lord Chief Justice.

Mastodon, an extinct order of quadruped closely resembling the elephant in structure, but much larger.

Materialism is the philosophical belief that the basic stuff of which the universe is made is matter, and that everything in the universe is either matter or derived from matter. The earliest materialists were the Greek philosophers of the Ionian School in Asia Minor—Thales of Miletus, Anaximander, and Anaximenes (*c.* 600–550 B.C.). After Plato, the philosophy of materialism seemed to be discredited and was little heard of until the 19th century, when advances in physical science seemed to make the theory more plausible. It is now generally thought that, with further discoveries, the position is once more untenable. But it must be remembered that there are two forms of materialism—the atomistic–mechanistic type and the organismic type. The former somewhat crude belief is, it may safely be said, untenable. It

held, for example, that man and other living things are mere machines, and that concepts such as mind, beauty, truth are meaningless. Organismic theory holds that all things, living or otherwise, are systems of energy—that one must consider not merely structure but also relations and process. Mind in this theory is not a thing but a process occurring at a particular level of development, beauty is a particular relationship between object and observer, truth similarly is a relationship. Since the body, for example, consists of relationships between organs as well as the organs themselves, it cannot be explained as the mere sum of its parts. "The whole is more than the sum of its parts." In this form the theory of materialism is much more tenable and cannot be said to be outdated.

Mathematics is the language of physics, and uses symbols for expressing measurements, theories, and laws. Mathematical formulæ summarise and condense in exquisite simplicity the results of vast numbers of observations and experiments.

Matins, the first of the canonical hours or services of the day in the Roman Catholic Church and Morning Prayer in the Anglican Church. The daily service in the Roman breviary (*q.v.*) consists of eight offices or "hours," fixed by canon, for prayer and devotion. Formerly, Matins was recited or sung at midnight, Lauds at sunrise, Prime at 6 a.m., Terce at 9 a.m., Sext at midday, Nones at 3 p.m., Vespers at sunset, and Compline before retiring for the night. Lauds are now commonly joined to Matins.

Matriarchate, an ancient theory that the mother was the source of authority and not the father, and that in the "golden age" women exercised supreme control.

Mau-Mau, a secret, anti-European, terrorist movement which agitated the Kikuyu tribe of Kenya during the years 1953–57. Mau-mau was a symptom of native insecurity and discontent; emergency powers were lifted in Nov. 1959, and large-scale reforms are in progress.

Maundy Thursday, the day before Good Friday, commemorates the Last Supper. "Maundy" derives from Christ's command (mandatum) to his disciples on that day to love one another. It was the custom in the monasteries for the monks to wash the feet of the poor on this day, and for many centuries the sovereigns of England, through their almoners, have distributed money, food, and clothing to "as many old men and as many old women as the Sovereign is years of age." The Royal Maundy ceremony is still observed, special silver money granted by the Royal Almonry is coined for the occasion and the distribution takes place in Westminster Abbey. (*See* **U.K. Coinage, N9**.)

Mausoleum, a special place of sepulture, generally for the reception of the remains of members of a royal or other family of distinction. The name is derived from the tomb of King Mausolus at Halicarnassus, erected about 350 B.C., and forming one of the seven wonders of the world. The royal mausoleum at Frogmore was founded by Queen Victoria, where she was buried, together with the Prince Consort and other members of the Royal Family since deceased.

Mauve, a colouring matter produced from lichens by Dr. Stenhouse in 1848, but in 1856 obtained from aniline by William Perkin (1838–1907), who gave it the name Mauveen. This was the first synthetic organic dyestuff ever to be produced, which led to the building up of the great synthetic dyestuffs industry.

May, the fifth month of the year, but the third of the ancient Roman calendar. Supposed to be named after Maia, the mother of Mercury, to whom sacrifices were offered on the first day of this month. In England in former days May Day was made the occasion of many festivities, including the crowning of the May Queen, dancing round the Maypole, etc.

"Mayflower," the name of the ship which in 1620 conveyed the Pilgrim Fathers, 101 in number, from England to America. (*See* **Pilgrim Fathers**.)

May Fly, sluggish insects abundant over streams and rivers. The larvæ, which are aquatic, live several years, but the adults die a day or so after emerging and laying their eggs.

Mayor. In Great Britain various authorities share the work of local government. The village has three authorities, the parish council, rural district council, and county council; the small town has two, the urban district council and county council; the medium-sized town has two, the borough council and county council; the large-sized town has only one, the county borough council. Only the boroughs and county boroughs have a mayor and corporation. A mayor is *ex officio* a justice of the peace during his term of office. He represents the borough on all formal occasions, and has precedence (subject to Royal prerogative) over everyone else in the borough. Some cities, notably London and Birmingham, have a Lord Mayor. The chief Scottish cities have their Lords Provost. (*See* **Local Government, C3–4**.)

Mazarin Bible, an edition of the Latin Vulgate discovered in the library of Cardinal Mazarin, from which Gutenberg in 1452–55 printed the first book for which the metal types were used.

Mazurka, a Polish dance in 3-beat time. Chopin wrote many Mazurkas as concert-pieces for the pianoforte.

Meal-Tub Plot was a pretended conspiracy in 1679 against the Duke of York, afterwards James II., concocted by an informer named Dangerfield, who sought to incriminate the Earls of Halifax, Essex, and Shaftesbury. Evidence of the fictitious nature of the plot was subsequently discovered in a meal-tub belonging to a woman with whom he had lived, and he was publicly whipped and put in the pillory. A man named Francis struck him a blow which caused his death, for which the assailant was hanged.

Meal-Worm is the larva of a beetle—*Tenebrio molitor*—and is found in corn mills, granaries, and bakeries, where it does considerable damage. It is largely used for feeding birds.

Mean. In mathematics generally understood to be the arithmetic mean, *i.e.*, the average. The geometric mean between two quantities is the square root of their product.

Medals, as decorations for military service, were first issued in this country by Charles I., who ordered medals for gallantry to be distributed to certain soldiers in 1643. Medals were also issued to officers and men who were victorious against the Dutch fleet in 1653. After Lord Howe's victory in 1794 a naval medal was instituted. Medals were also struck for the victory of Waterloo, and since that time special medals have been issued in connection with all our wars. The Victoria Cross, a special reward for personal gallantry in the Navy, Army, and Air Force, was instituted in 1856. The George Cross for gallantry instituted in 1940 ranks next to the Victoria Cross. The Military Cross was instituted in 1914.

Medlar, a tree of which the fruit is about 1 in. in diameter and hard fleshed when gathered, but after being stored for a few weeks it softens. It has a peculiar flavour. Its large white flowers give it a decorative appearance.

Meerschaum, a white or yellow-white earthy mineral, found in beds in Asia Minor, Greece, and other places, is a silicate of magnesium allied with water. Its chief use is in making pipe-bowls, though in Spain it is used for building purposes.

Megalith, a prehistoric monument, consisting of a large single stone or a group of such stones, in a circle as at Stonehenge or in burial chambers as at New Grange, Ireland. Megalithic monuments have been constructed by different peoples in different parts of the world since the third millennium B.C.

Megalosaurus, an extinct reptile of enormous proportions, having a length of from 30 to 40 ft. Fossil remains of this monster have been found in Oolithic Slate and Weald Clay.

Meiosis, a process of plant or animal cell division, in which the number of chromosomes is halved, only one member of each pair of chromosomes appearing in each gamete or sex-cell. *See* **F31** (1).

Melody, a succession of single notes forming a pattern around which the rest of the composition (harmony, counterpoint) is woven. The theme (of a fugue, for instance) is a short melody.

Mendelian Law. The first statistical rules of inheritance, determining the ratio of variation

of characteristics in the offspring of differing individuals, and the classification of characters discontinuously inherited, were first formulated by the Austrian monk Gregor Mendel. The results of his most important experiments in the crossing of peas were published in 1866, and showed that when two races are crossed, the resultant hybrids will exhibit the dominant features of one parent, but the offspring of the second generation will show those of both grandparents. *See* **F30–31.**

Mendicant Friars, certain religious orders which spread over Europe in the 13th century, and comprised the Franciscans, Dominicans, Augustines, and Carmelites. Originally they depended entirely on alms.

Meniscus, the curved surface of a liquid in a tube.

Mennonites, a protestant sect, an offshoot of the Anabaptists, which broke away in 1525 and adopted the doctrines of Menno Simons, a Dutch reformer. At first known as the "Swiss Brethren." There are several communities still existing. (*See* **Anabaptists.**)

Mercator's Projection, a method of indicating meridians and parallels of latitudes on maps, introduced by Mercator in the 16th century, and still universally used in navigator's charts.

Mercers' Company, the wealthiest and one of the oldest of the London Livery Companies. It governs St. Paul's School and the Mercers' School and administers many important charities.

Merchant Adventurers' Company, a famous chartered regulated trading company which operated from the 14th century to near the end of the 16th century. It had a monopoly of the export trade in cloth.

Merciless Parliament, the name given to the parliament of 1388 summoned by Richard II., which decreed the execution of several of the king's ministers and the outlawry of the Duke of Suffolk.

Mercury, one of the smaller planets and the nearest to the sun, being 36 million miles distant. It has no satellite.

Mercury *or* **Quicksilver,** is one of the oldest-known metals, whose chief ore is the sulphide, cinnabar found in certain parts of Spain, China, Japan, Mexico, and South America. It is liquid at ordinary temperature. It is largely used in the construction of barometers and thermometers. Alloys of mercury are called amalgams. It is also of great value in medicine.

Meridian, an imaginary circle extending through the North and South Poles and any given place. When the sun is at its midday height at any place it is " on the meridian "; hence the terms ante-meridian (a.m.) and post-meridian (p.m.).

Merino Sheep were imported into England from Spain in 1788, and had great influence in improving native breeds, especially in regard to the quality of the wool.

Merit, Order of, founded by King Edward VII. in 1902 as a special distinction for eminent men and women without conferring a knighthood upon them. The Order has twenty-four British companions in addition to foreign honorary members limited in number, as the choice of members is, by the Sovereign's pleasure. Lord Kelvin was the founder companion. The only honorary members still alive are General Eisenhower (1945) and Dr. Schweitzer (1955). Florence Nightingale is the only woman to have received this coveted decoration.

Merovingians, the name given to the family that ruled over France from about 500 to about 750. Clovis was first of the line and Chilperic the last.

Mesons (from Greek *meso* = middle), a family of unstable particles of mass between that of an electron and that of a proton believed to be important in the interaction of protons and neutrons in the atomic nucleus. Some are positive, some negative, some neutral. No stable meson is known, the longest-lived particle having a lifetime of only two-millionths of a second. The first of these particles was discovered in cosmic radiation in 1937 and called the mu-meson or *muon*. In 1947 a heavier type was discovered called the pi-meson or *pion*, which behaved like the meson predicted on theoretical grounds by Yukawa in 1935. (It is the pion that keeps the proton and neutron together in the nucleus.) Charged pions decay into muons and *neutrinos*; neutral pions disappear into energy in the form of gamma rays. Later work has led to the discovery of mesons of still higher masses. Particles of masses greater than that of the proton, also found in cosmic radiation and produced artificially, are called *hyperons*. *See also* **F12, 13.**

Mesozoic. The geological era which includes the Triassic, Jurassic, and Cretaceous rocks. It began about 225 million years ago and lasted about 150 million.

Metamorphic Rocks are such geological deposits as have undergone alterations of structure and composition. The most active agents in producing these metamorphic changes are heat, water, and pressure. *See* **F8** (2).

Métayage, a system of land tenure prevalent in Italy and France, whereby the landlord provides the land and materials and the tenant the labour, the produce being evenly divided between them.

Meteorites. The word meteor originally signified any natural phenomenon, but in modern usage meteors are small bodies coming from interplanetary space which become luminous by friction on entering the earth's atmosphere. Popularly called "Shooting Stars." Larger meteors are known as fireballs. Some of these reach the ground. The object which has been a meteor in flight then becomes a meteorite. In some meteorites iron is the predominating element, others are like rock. The iron meteorites are more common amongst those which have been preserved, but falls of rock-like meteorites occur more frequently. At l'Aigle in France in 1803 from 2000 to 3000 meteorite stones fell; this fall is famous because it convinced scientists that meteorites really came from outside our atmosphere. (The largest meteorite stone actually known to have fallen to earth is one which descended in Emmott County, Iowa, in 1870, weighing 437 pounds.) A meteorite weighing no less than 36½ tons found in Greenland is now in New York. On June 30, 1908, an enormous meteor fell in Siberia in a sparsely-inhabited region. A hot blast destroyed all trees within a radius of about 5–10 miles, the explosion waves being recorded by barographs as far distant as London, Washington, and Batavia. For the next few nights there was in Europe in the northern sky brilliant illumination due to sunlight falling on clouds of dust at a great height in the atmosphere. Whether this dust had accompanied the meteor in its journey through space like the tail of a comet or whether the dust had come from Siberia is unknown. When the place where the meteor fell was visited in 1927 some 200 craters were found, but no considerable meteorite has been recovered.

Meteorology, the science of the atmosphere considered as a heat engine. Deals with weather, climate, optical phenomena, atmospheric electricity, physical processes such as radiation and precipitation, the dynamics and structure of cyclones, anticyclones, etc. Wide application to problems of aviation, agriculture, commerce and shipping. Meteorological observing stations are in operation all over the world, and on the simultaneous or synoptic reports of their instrument readings and estimates of pressure, temperature, humidity, speed and direction of wind, rain, character and amount of cloud, visibility, etc., forecasts, gale, snow and frost warnings are based. The Meteorological Office is part of the Air Ministry, whose Director is appointed by the Air Council. *See also* **Weather** and **F46** (2).

Methane. This gas occurs over marshes and swamps, where it is liberated in the decay of vegetable matter. It is the main constituent of natural gas, and also occurs in coal-mines, where it is called " fire-damp " because of the explosive character of its mixture with air.

Methodists, a term designating the religious organisation founded by John Wesley in 1739, after a long course of successful preaching by him in all parts of the kingdom as well as in America. It professed to have but one aim, " to spread scriptural holiness over the land." The itinerant system of the ministry is a prominent feature of the organisation. Since Wesley's day, some

off-shoots of Methodism have arisen and flourished. A scheme of union was consummated in Sept. 1932 at a United Conference in the Albert Hall, London, whereby the Wesleyan Methodist, the Primitive Methodist, and the United Methodist Churches became one Church, now known as The Methodist Church.

Methylated Spirit, a mixture of 90 parts by volume ethyl alcohol, 9½ parts wood naphtha (methyl alcohol), ½ part crude pyridine, together with small amounts of petroleum oil and methyl violet dye. Industrial methylated spirit consists of a mixture of 95 parts by volume ethyl alcohol and 5 parts wood naphtha.

Metre, unit of length in centimetre-gram-sec. system = 39·37 in.

Metre is the form of poetic rhythm, or the way words are arranged in a rhythmic pattern to make verse. *See* **M2–4.**

Metric System, the system of weights and measures based on the gram and the metre, smaller and larger units being decimals and multiples of the primary units respectively. It became the legal metrology of France in 1795, but was not in general use until about 1840. Since then the metric system has been adopted in most of the continental countries and is used universally in scientific work. There have been many attempts to get the system adopted in Britain, and there is now reason to hope that others will follow the enterprising example of the pharmaceutical industry, which adopted metric weights and measures in wholesale trading in July 1953. *See* **N11.**

Metronome, an instrument for beating time during the performance of a musical composition. It has a double pendulum, and is wound up like a clock.

Mezzotint, an engraving from copper or steel produced by instruments which burnish and scrape away portions of the surface, and yield an impression effectually graded in light and shade.

Mica. The mica of commerce is a nearly transparent mineral, which has great heat-resisting power, and can be split into thin plates. The most important micas are muscovite (potassium mica), the commoner variety, and phlogopite (magnesium mica).

Michael, St., and George, St., an order of knighthood originally founded for the Ionian Isles and Malta in 1818, and reorganised in 1869, so as to admit Crown servants connected with the Colonies. The Earl of Derby, Earl Russell, and Earl Grey were the first of the new knights.

Michaelmas Day, the festival day of St. Michael and All Angels, Sept. 29th, one of the English quarter days.

Microbe, a term proposed by Sédillot in 1878 to denote any minute organism, vegetable or animal, or found on the borderland between the two great natural kingdoms. The term is commonly used, but not by scientists.

Micrometer, an instrument for measuring minute distances; usually attached to the eye-pieces of a microscope or telescope, and consisting of two very fine hairs or wires stretched across the field of view, one fixed, the other movable. It was invented by William Gascoigne in the 17th century and improved by later inventors. Sir Joseph Whitworth made one in 1858 to measure the millionth part of an inch.

Microphone, an instrument for converting sound waves into electrical variations. The first microphone was invented by Prof. David Edward Hughes, in 1878. It is used for telephone communications, in broadcasting, in gramophone recording, etc.

Microscope, invented about 1590 by Janssen, and improved by Galileo, Fontana, and others, is an instrument which by a lens system magnifies minute objects. Microscopes are simple, compound, and binocular. The more powerful instruments have a magnifying capacity of as much as 10,000 diameters. (*See also* **Electron Microscope.**)

Middle Ages, usually considered to comprise the 1000 years from the fall of the Western Roman Empire in the 5th century to the Renaissance in the 15th. The period was essentially the age of faith and we owe it many churches of incredible beauty. It was dominated by the Roman Church, while the monasteries were the storehouse of learning until the rise of universities in the 13th century. Feudal ideas and practices became very widespread, their later decline being hastened by the Black Death. (*See* **Section G.**)

Midge, the common name of small two-winged flies of the genus *Culicoides*. The term "gnat" is sometimes applied to midges, though in Britain it is more commonly a synonym for the mosquito, clouds of which appear on summer nights in country places.

Midrash, name given to the homiletical interpretation of some of the Hebrew Scriptures in which allegory and legendary illustration were freely used. Compiled by Jewish rabbis from *c.* A.D. 200.

Millenary Petition was presented to James I. in 1603, on behalf of nearly 1,000 Puritan Ministers against certain of the rites and ceremonies of the Church of England. The Hampton Court Conference was the outcome of this petition.

Millennium, a period of a thousand years. The term is specifically used of the period of a thousand years during which, according to Rev. xx. 1–5, Christ will reign in person on earth. The Millenarians are a sect that interprets the "Millennium" as beginning with the commencement of the 6001st year from the Creation, which according to Archbishop Ussher (1581–1650) was in 4004 B.C.

Millipede. Arthropods allied to the centipedes, from which they differ in having two pairs of legs to each body segment instead of one pair. Worm-like in shape but with a pair of antennæ on the head, they are vegetarians and can do much harm to garden plants.

Millstone-Grit, a bed or rock of the Carboniferous group underlying the Coal Measures, and attaining in England a thickness in parts of 5,000 ft. It is from this rock that millstones have been made from time immemorial.

Mimicry, the resemblance of an animal to another animal or to inanimate objects. Examples of the former are the hover flies, which mimic wasps and bees; of the latter, leaf insects, stick insects, and caterpillars that look like dead twigs.

Mind. The nature of mind has for the most part been thought of as a philosophical problem, and historically has been described in terms of three main theories: those of materialism, idealism, and dualism. Materialism implies that mind does not, in fact, exist—it is merely an illusion, since the whole universe is composed of matter and matter alone. This belief, held by the Ionian school of Ancient Greece, has been held by few other philosophers. Idealism, on the other hand, takes the opposite point of view: it considers that matter is an illusion and that the whole universe is composed of the same stuff as mind. Sometimes, as in the philosophy of Berkeley, this belief takes the form of a theory that the universe is a thought in the mind of God. Dualism, the third viewpoint, insists that both matter and mind are fundamental—that neither can be reduced to the other. Most philosophers have held some form of this theory. The difficulty about dualism is that, if both mind and matter exist, it is very difficult to see how they interact—how thought is translated into action and how physical states of the body can (as they obviously do) influence the mind. Three further theories have been devised to explain how, if we accept dualism, interaction takes place. These are: (1) interactionism, which simply insists that interaction does take place; (2) psychophysical parallelism, which states that mind and body are parallel processes which coincide by the will of God but never really act one on the other; and (3) epiphenomenalism, the theory that mind is simply an appearance given off by matter as a flame is produced by a candle. In recent times, however, psychology has had something to say about the problem. Most psychologists consider that mind is a process, not a "thing." We do not, for example, ask to see what a "digestion" is or what it looks like—we accept the obvious fact that digestion is a reality but that it is a process going on in the stomach. In much the same way, the psychologist says, mind is a process going on in the brain. *See also* **Section F (Part III).**

Minim, a musical term denoting a note equal to two crochets, or half the value of the semi-

breve; also pharmaceutical term for $\frac{1}{480}$th part of a fluid ounce.

Mink. Semi-aquatic mammals closely related to polecats. There is one American species and one European. The fur, which varies light to dark brown, is soft and thick, and is among the most valuable of commercial furs.

Minnesingers were minstrel poets of Germany who, during the 12th and 13th centuries, composed and sang verses of heroism and love. They were of knightly rank, the counterpart of the French troubadours. *See* **G39** (1).

Minnow, a small fresh-water fish of the carp family, abounding in all the waters of Europe; it has a mottled back and silvery belly, and forms a popular bait for trout.

Minor Scale. (*See* **Diatonic Scale.**)

Minstrels were originally specially appointed instrumentalists and singers—pipers, harpers, and gleemen—engaged by barons and manorial lords to amuse their tenants. Later, minstrels assumed nomadic habits, made their way into the houses of the great, and were generally welcome. By Elizabeth's time, however, they were too numerous, and they were classed as "rogues and vagabonds," along with actors.

Minuet, a composition in 3-beat time and in the rhythm of the minuet dance. A movement of a sonata or symphony may be in minuet form.

Miracle Plays, which were very popular in England in the 15th century, were usually religious in character, representing some of the dramatic incidents of the Bible. Staging of plays was one of the many activities of the Gilds of those days. *See* **G39** (2).

Mirage, an optical illusion often observed in desert regions when the objects on the surface of the earth often some distance away appear as if reflected in a surface of water. Mirage is due to the unequal heating of the different parts of the atmosphere, which bends the light rays, and so produces distorted images.

Mishna, the first part of the Talmud, setting forth the "Oral Law" of the Jews.

Missal, the name of the mass-book of the Roman Church compiled 492–96 by Pope Gelasius I., and revised by Gregory I., 590–604. The present Roman Missal was sanctioned by the Council of Trent 1545–63. In the Anglican Communion the Book of Common Prayer superseded the Missal in 1549.

Missel-thrush receives its name from its partiality to the mistletoe-berry. Larger than the song-thrush, with spotted breast rather than speckled.

Mistletoe, a parasitic evergreen with white berries used as a decoration at Christmas-time. The familiar mistletoe of Europe is the *Viscum album*, which grows on the boughs of lime, willow, apple, poplar, maple, ash, hawthorn, but seldom on oak-trees. It was sacred to the Druids, and in Norse mythology it was a mistletoe dart that killed the god Baldur.

Mistral, a cold dry northerly wind peculiar to the French coast of the Mediterranean.

Mites, minute animals related to spiders, but without the well-marked division of the body exhibited by the latter. Some are parasites, *e.g.*, the scab mite and mange mite. The garden pest called the "red spider" is really a mite.

Mitrailleuse, a breech-loading machine gun adopted by the French army previous to the Franco-German War of 1870.

Mitre, the twofold pointed head-dress of bishops and certain abbots of the Western Church, and occasionally of other ecclesiastics.

Moa, the name for several species of ostrich-like extinct birds related to the New Zealand kiwi. The largest species, *Diornis maximus*, stood 8 ft. 7 in. high. They died out about 500–700 years ago.

Moabites, a race of Judæa, descendants of Lot. They were often in conflict with the Israelites, but were finally subdued by Jehoshaphat, 895 B.C.

Moabite Stone, a stone of the 9th century B.C. containing the earliest known inscription in Phœnician characters, and discovered in the highlands of Moab in 1868. It is now in the Louvre, Paris. It records the campaign between Moab and Israel, a different account of which is given in the Old Testament.

Mocking Bird, an American bird of the thrush family, widely distributed over the north and south of the western hemisphere. It is renowned as a beautiful songster, and has remarkable mimicking powers.

Moderator, a material used to slow down neutrons in an atomic pile. Examples of moderators are pure graphite and heavy water. *See* **F51** (1).

Mohair is the wool of the Angora goat and used very largely in the worsted trade for the manufacture of dress fabrics.

Mohammedanism. *See* **Islam.**

Molasses, sugar-cane juice in its uncrystallised form after boiling. The crystallised part is the raw sugar.

Mole, a small burrowing animal with long, sensitive nose, about the size of a small rat, with short legs and forefeet armed with strong claws for digging in the earth. Their subterranean dwellings are of curiously ingenious construction, and they do not often leave them except to make raids on mice, frogs, snails, etc. The earth-worm, however, is the mole's chief item of food. Not to be confused with the vole which has a blunt nose.

Molecule, the smallest mass of any substance, whether an element or a compound, capable of independent existence, and still retaining the properties of the substance. *See* **F11** (2).

Mollusca designates the soft-bodied invertebrate animals, most of which are protected by a shell. These shells are univalve—that is, of one piece, as in the case of snails; bivalve, as in the oyster; or multivalve, in the mail shells (*Chiton*). The squids, octopus, and nautilus are also molluscs, belonging to the class called Cephalopoda, the distinctive feature of its members being possession of tentacles. *See* **F24** (2).

Molybdenum, a fairly hard white metal with properties resembling those of chromium. Its commonest ore is the sulphide, molybdenite. The chief use of the metal is in the manufacture of alloy steels; high-speeding cutting steels can contain about 10 per cent. of molybdenum.

Monazite, a cerium mineral containing some thorium. Occurs as grains, often as sand ("monazite sands"). Deposits occur in India (Travancore), Russia, Norway, Madagascar, S. Africa, Brazil, U.S.A.

Monday, the second day of the week, called by the Anglo-Saxons *Monandaeg*, because the first hour of this day was supposed to be ruled by the moon.

Mongols, a yellow race of Central Asia, largely nomadic. In the 13th century, they conquered large portions of Asia, including China, Persia, and India. They founded the Mogul dynasty in India in 1525, and ruled up to the end of the 18th century, when their empire came under British control.

Mongoose, species of mammals related to the civets, feeding on vermin and reptiles. These animals, which have long tails and short legs, occur in Africa and Asia (especially India). The biggest mongoose is the Egyptian ichneumon, and this has been introduced into the W. Indies because of its ability to kill large poisonous snakes.

Monitor, a family of lizards noted for their great size. There are about 30 species widely distributed over the tropical parts of Asia, Australia, and Africa. The monitor, which lives on Komodo and other E. Indian islands, is 7 ft. long and known as the "Komodo Dragon."

Monmouth's Rebellion was headed by James, Duke of Monmouth, a natural son of Charles II. (1649–1685). He was sent to Scotland to quell the Covenanters in 1675, and succeeded in winning the Battle of Bothwell Bridge 1679; but was banished for aspiring to the throne to the exclusion of the Duke of York, afterwards James II. In 1685 he landed at Lyme Regis, and assumed the title of king, but was defeated at Sedgmoor, and executed on Tower Hill. Judge Jeffreys stamped out the remnant of the rebellion in the "Bloody Assize."

Monocotyledons. One of the two sub-classes into which the Flowering Plants (or Angiosperms) are divided. Distinguishing features are: the veins of the leaves run parallel to each other, and the parts of the flower are arranged in multiples of three. Most monocotyledons are herbs; many are cultivated for their beautiful flowers, *e.g.*, lilies, tulip, daffodil, iris, orchids,

and cannas. A few are tree-like, *e.g.*, bananas, pineapples, bamboo, and palms. *See* **F28**.

Monolith, a column or shaft comprising a single stone. "Cleopatra's Needle," now on the Thames Embankment in London, is an example.

Monotremata, the name of the order of mammalia comprising the most primitive mammals, which lay eggs. There are only two genera in this order; the Duck-billed Platypus (*Ornithorhynchus*), the Spiny Ant-Eaters or Echidnas.

Monroe Doctrine, a principle of American policy declining any European intervention in political affairs of the American continent, outlined by President Monroe in 1823. At the same time interference was disclaimed with existing European colonies in the Western Hemisphere. The American Civil War hampered the application of the doctrine for some time, but afterwards the United States firmly insisted on it. The Doctrine is not international law, but a national policy of the U.S.A.

Monsoons, regular persistent winds which blow at certain seasons in middle latitudes, mainly in South and East Asia. Their occurrence is related to the great changes of pressure which take place between summer and winter over the land mass. In India the south-west monsoon (June–Oct.) is moisture-laden from its long passage over the sea and in the higher regions, especially, there is heavy rainfall. Sudden reversal of the wind results in the cold north-east monsoon (Oct.–March) which is dry on account of the shelter afforded by the mountain ranges to the north. Frequently the term "monsoon" is applied to denote the associated rainfall without reference to the actual winds.

Monstrance, an ornamental transparent receptacle in which the Sacred Host is carried in procession or exposed for adoration.

Montessori System of education was worked out by Dr. Maria Montessori (1869–1952) in the early 20th century. She first experimented on defective children (aged 3–6) in the slum districts of Rome. Her results were so amazing that she began work on normal children. The *Casedei Bambini* (rooms set apart for children in the courtyards of a tenement block) became world famous. Her system is based on free discipline and free movement and not on the annihilation of a child's individuality and its immobility on a bench in a classroom. Dr. Montessori invented apparatus for her pupils which stimulates interest and creates attention. Children in her schools can learn to read, write, count, and do simple arithmetic before the age of 6. Her method has revolutionised infant education, and it is being used in many countries.

Month, the 12th part of the calendar year. A lunar month is the interval of new moon to new moon or full moon to full moon; mean length, 29 days, 12 hours, 44 minutes, 2·87 seconds. A sidereal month represents the time of the moon's revolution from a given star back to the same again, 27 days, 7 hours, 43 minutes, 11·5 seconds. In English law, since 1926, a month, unless otherwise expressed, means a calendar month.

Monts-de-Piété, Government institutions for advancing money for goods left in pledge, were first established in Italy in 1462. Similar institutions in France in 1777 were suppressed by the Revolution, but restored by Napoleon, and have since been expressly regulated by law.

Monument of London, erected in 1671–77 by Wren in commemoration of the Great Fire, is 200 ft. high and cost £14,500. The original inscription upon it ascribed the fire to "the treachery and malice of the popish faction," which stood down to 1831, when the words were erased as objectionable. The black marble staircase consists of 345 steps.

Moon, the earth's satellite, 2,160 miles in diameter and 238,857 miles distant from the earth. Its surface is believed to be covered by a layer of dust, the depth of which is as yet unknown. For the first time in history a space flight from the earth to the moon was made on 13 Sept. 1959 by the Soviet space rocket *Lunik II*, which hit the moon after 36 hours' journey; *Lunik II*'s instruments confirmed that the moon has no external magnetism and no radiation belt around it. *Lunik III* photographed the back of the moon. *See also* **Luniks, F46** (2), **49** (2).

Moorhen, a bird of the crake family, familiar on the borders of British ponds, rivers, and lakes. Dark-grey plumage, with olive-brown wings edged with white; yellow-tipped red bill.

Moors, the name given to the Moslems who live in N.W. Africa and to those who once lived in Spain. In 711 Moorish Arabs invaded Spain and spread beyond the Pyrenees into France, where they were driven back by the end of the century. Spain, however, remained virtually under Moorish domination until the 11th century, and during that period was the most civilised and prosperous part of Western Europe. In the arts and sciences the impact of Moorish culture was profound and lasting. Examples of the brilliant splendour of Moorish architecture are still to be seen in Toledo, Córdoba, Seville, and Granada. During the long struggle for the Christian reconquest thousands were killed and expelled, and in 1492 Granada, their last remaining kingdom, was forced to surrender. They were virtually exterminated by the Inquisition, and the last were expelled in 1609. *See also* **G31** (2).

Moose, the largest members of the deer family. The N. American Moose stands 5½–6¾ ft. high, and has huge palmate antlers. There is another New World species, occurring in Alaska. The European species is known as the elk.

Morganatic Marriage, a form of marriage, formerly peculiar to Germany but also found in the royal families of other countries, where the contracting parties are of unequal rank. In such marriages the left hand is given instead of the right, and it is stipulated that the children of the marriage are not to enjoy the rank or inherit the possessions of the parent, though such children are legitimate. Morganatic marriage is unknown in English law.

Morgue, a repository for dead bodies awaiting identification, the best-known morgue being that of Paris, which was formerly open to the general public.

Mormons, *or* **Latter-Day Saints,** a religious sect founded by Joseph Smith in 1830 under the title of the Church of Jesus Christ of Latter-Day Saints. The Church encountered opposition and persecution, and finally established itself in Salt Lake City in Utah, where it has grown and prospered. Polygamy, introduced by Brigham Young, who succeeded Smith in 1847, was repudiated by the Mormon community in 1890. Utah was recognised as a State of the Union in 1896.

Morpunkee, an Indian pleasure-boat, long and narrow, of considerable capacity, with a high peacock-shape decoration at the stern.

Morris Dance, an old English country dance of the reel order.

Morse Alphabet, a system of dots and dashes, intended to be used in combination with the indicator in telegraphy; but usually read by sound, the receiving operator writing down the words in the system as transmitted. This system of signals was invented by the American inventor and artist Samuel Finley Breese Morse (1791–1872) of Charlestown, Massachusetts.

Mosaic, a joining together of small pieces of coloured glass, marble, or other materials in designs to imitate painting. *See also* **G30** (1).

Moscow, the Retreat from, was one of the most disastrous events in the career of Napoleon I. He entered Moscow on Sept. 14, 1812, and the next day the Russians set fire to the city, practically burning it down. The French were forced to evacuate, and in the retreat to France Napoleon lost the greater part of his army.

Mosque, a Mohammedan church, the greatest being that of Santa Sophia at Istanbul, now converted into a museum of Byzantine art. *See* **G28** (2).

Mosquito, small two-winged flies with long legs and and slender body. Their larvæ are aquatic. The females of some species are blood-suckers, and thus come to transmit the blood parasites which cause malaria and yellow fever, for example.

Mosses. Most mosses live in moist habitats, but there are some species that can withstand desiccation and are adapted to live on rocks and tree-trunks.

Moss-troopers were bands of Scottish marauders who used the mossy regions of the Scotch and English borders as hiding-places, and thence

made frequent plundering expeditions, keeping that part of the country in constant unrest. They were put down in the 18th century.

Motet, an unaccompanied anthem of the Catholic and Lutheran Churches. Many fine motets which were settings of sacred writings or paraphrases and which were written mostly in the 15th century still survive.

Moth. Together with the butterflies, the moths make up the insect order *Lepidoptera*, in which the wings are scaly. In most moths the antennæ taper to a point, and are not clubbed as in butterflies. The majority are nocturnal, and pupate in a cocoon, whereas the pupa of butterflies is naked and usually bright-coloured.

Motion, Laws of. According to Newton: (1) A body continues in its state of rest or uniform motion in a straight line except in so far as it is compelled by external forces to change that state. (2) Rate of change of momentum is proportional to the applied force, and takes place in the direction in which the force acts. (3) To every action there is an equal and opposite reaction.

Movement, one of the contrasting pieces which together make up a Sonata, Symphony, or Concerto. A typical sonata has three movements, while a typical symphony has four.

Mule, a hybrid between horse and ass. Also the name of the spinning machine invented by Crompton in 1779 which combined the principle of Hargreaves' spinning jenny with the machine invented by Arkwright.

Mullions are projecting windows with vertical divisions—forming a highly decorative feature in Gothic architecture. The horizontal stones forming the crossing divisions between the lights of this class of window of the Elizabethan or Tudor period of Gothic are styled transoms.

Mummies are embalmed bodies, found mostly in Egypt, supposed to be those of distinguished people who lived thousands of years ago. Mummies have also been found in Peru, Mexico, and Persia. The embalming process which has enabled the bodies to be preserved can only be conjectured, though it is known that various aromatic substances were used after the viscera and other vital organs had been removed, the cavities being filled with absorbent dust, chippings, and cedar wood. A splendidly preserved and magnificently decorated mummy of the Pharaoh Tutankhamen (1350 B.C.) was found and minutely described in 1925.

Munich Agreement. In Sept. 1938 Mr. Neville Chamberlain and M. Daladier, British and French Premiers, reached agreement with Hitler at Munich for the dismemberment of Czechoslovakia, primarily for the benefit of Germany. Czechoslovakia itself was not consulted, nor Russia which with Britain and France had jointly pledged themselves to uphold the independence of Czechoslovakia. Hitler had been threatening that country for some time, but every concession had been met by further demands. After three visits to Germany, during which Hitler raised his demands, the British and French statesmen gave way. Mr. Chamberlain declared on return that he had secured "Peace in our Time." The Agreement was the subject of much controversy. Hitler seized Czechoslovakia in Mar., 1939.

Musk Deer, a small deer of the Himalayas, standing about 20 in. high. It is grey in colour, slightly brindled, and carries a small pouch in the abdominal region, containing what is commercially known as musk, an article which is of great value in the manufacture of various perfumes.

Musk Ox, an animal with characteristics of both sheep and ox, and having a musk odour. It is a native of Northern Canada.

Mussel, a well-known bivalve mollusc found in great abundance on the rocks of the sea-shores. The freshwater mussels of streams and ponds do not belong to the same genus.

Mutton Bird, an Australasian name of controversial origin for a shearwater or petrel, *e.g.*, the Short-tailed and Sooty Shearwaters and the Great-winged, Kermadec, and White-headed Petrels. The young are taken by hand from their burrows for human food.

Myriapoda, the class of invertebrate animals including centipedes, millipedes, and many others. They are widely distributed, but the largest species are found in the tropics.

Myrrh, a resinous substance obtained from a tree of the natural order *Amyridaceæ*, growing plentifully in Abyssinia and Arabia. Its use for embalming, medical, and aromatic purposes may be traced back to the most remote times.

Mysteries, Greek, secret mystic ceremonies of the ancient Greeks, religious drama accompanied by dancing, the most well known being the Eleusinian and Orphic ceremonies.

Mystery Plays were the mediæval religious dramas performed by the priests at great ecclesiastic festivals, particularly in France and Bavaria, staging the Nativity, Passion, and Resurrection. *See* **G39** (2).

Myxomatosis is a virus disease that affects only the rabbit family. It was first reported in 1898 from Montevideo, Uruguay, where a stock of laboratory rabbits—a domestic form of the wild European rabbit (*Oryctolagus cuniculus*)—was almost wiped out by it. It is now known that myxomatosis exists as a mild or sub-clinical infection in the native wild rabbits or tapetis (*Sylvilagus braziliensis*) of Brazil and possibly other parts of South America. In the European rabbit myxomatosis causes almost 100% mortality, the symptoms including intense swelling and inflammation of the eyelids, which spreads towards the forehead and ears, and may also affect the genital region. Although the appearance is distressing, it is by no means certain that suffering is severe. Many attempts have been made to introduce myxomatosis as a means of controlling rabbit numbers, but these were unsuccessful until January, 1951, when it was reported that the infection was spreading rapidly in parts of Australia. In 1952 it was introduced into France, and caused a marked reduction in the rabbit population. In the autumn of 1953 the disease reached Great Britain with the result that the total wild-rabbit population has been severely reduced. Domestic rabbits can be given a fair degree of protection through the use of a vaccine which is available at a low cost through veterinary surgeons and pharmacists.

N

Nadir, one of the two poles of the horizon, the other being the zenith. The nadir is the pole vertically below the observer's feet.

Nahum, one of the books of the Minor Prophets of the Old Testament. It is a prophecy of doom on the approaching sack of Nineveh which fell in 612 B.C. to the Medes and Babylonians.

Naiad, a water-nymph of classic mythology, beautiful and mystic; celebrated by Virgil, Ovid, Homer, and other ancient writers.

Nantes, Edict of, was a decree promulgated by Henry IV. of France in 1598, giving full freedom of worship to the Protestants of the country. It was the revocation of this edict in 1685 by Louis XIV. that drove hundreds of thousands of French Huguenots to this country.

Naphtha, a liquid combustible believed to have been one of the ingredients of "Greek fire." Naphtha is a light, highly inflammable oil obtained by distilling petroleum, shale oil, or coal tar. The petroleum naphtha consists of a mixture of paraffins; that from shale contains olefines as well as paraffins. Coal-tar naphtha contains xylol.

Naphthalene is procured from coal tar, and its derivatives are much used in the manufacture of colours for dyers and printers. "Moth balls" are made of naphthalene.

Narcotic, a medical dictionary definition is that a narcotic is a drug that produces stupor, complete insensibility, or sleep. In terms of drug addiction, a narcotic has been defined as altering and distorting the user's perception of himself and of the external world, being taken primarily for that purpose. *See* **P22–23**.

Nardus, a genus of coarse grasses, growing on bleak upland heaths and hill slopes. *Nardus stricta*, known as "mat-weed," is a British species.

Narghile, an oriental tobacco pipe so constructed that the smoke passes through water and up a long flexible tube before reaching the lips of the smoker.

Naseby, Battle of, was fought on June 14, 1645, between the Royalists under the command of

Prince Rupert and the King, and the Parliamentarians under Fairfax and Cromwell. It resulted in a complete defeat for Charles.

National Anthem, a musical composition with words, officially adopted for ceremonial use as an expression of patriotism and loyalty to a national cause. The national anthem of the United Kingdom is "God Save the Queen" which has been in use since about the middle of the 18th century. There is some doubt about its origin. It has been variously attributed to Dr. John Bull, Henry Carey, and James Oswald.

National Assembly, the name taken by the body responsible for the opening stages of the French Revolution and subsequently by other Sovereign bodies in France and elsewhere.

National Covenant, an oath and declaration subscribed to by the Scottish Presbyterians in 1638 to maintain their religion against Charles I.'s Episcopalianising designs.

National Debt constitutes the financial obligation of a state, and amounted in Great Britain at March 31, 1960, to an approximate total (net) of £27,735 million, an increase of £359 million over 1958–59. The National Debt is divided into *funded* and *unfunded* debt, the former representing debt in respect of which there is no fixed date for repayment, and taking the form of Consols and debts due to the Bank of England, while unfunded debt consists of Government loans, repayable at a fixed date.

National Gallery, established in 1824 at Pall Mall, London, with the Angerstein Collection of 38 pictures, purchased for £60,000 as a nucleus. The existing building which was opened in 1838 has been enlarged several times. The National Gallery at Millbank, known as the Tate Gallery, was given to the nation by Sir Henry Tate in 1897.

National Guard of France, a body of citizen soldiers first instituted on the day before the destruction of the Bastille in 1789, and ceased under the Consulate and Empire. It was revived in 1830, but was disbanded after fighting in the Franco-Prussian War.

Nationality, British. A British subject or Commonwealth Citizen is a person who is a natural-born British subject; a person to whom a certificate of naturalisation has been granted; a person who has become a subject of Her Majesty by reason of any annexation of territory or who, subject to certain exceptions, is the wife of a British subject. A natural-born British subject is one born within Her Majesty's Dominions and allegiance or if born out of Her Majesty's Dominions whose father was at the time of such person's birth a British subject. A married woman does not necessarily lose her British nationality either by virtue of her marriage to an alien or of her husband's subsequent change of nationality. The British Nationality Act, 1948, replaced the British Nationality and Status of Aliens Act of 1914 as the basis of the law of British citizenship. *See.* **D7** (1).

National Parks. Under the National Parks Act 1949 a National Parks Commission was set up to create National Parks in England and Wales. Twelve areas had been recommended in the Hobhouse Report, and of these several have already been designated. The areas named in the Report were the Lake District, Snowdonia, the Peak District, Dartmoor, the N. Yorkshire Moors, the Pembrokeshire Coast, Exmoor, the Yorkshire Dales, the South Downs, the Roman Wall, the Broads, and the Brecon Beacons and Black Mountains. It is not intended to change the character of these territories but to control their development so as to harmonise with the two dominant principles: (*a*) that the characteristic beauty of the landscape within the Park area shall be preserved and (*b*) that the visiting public shall have ample access and facilities for recreation and enjoyment. (*See also* **Long Distance Routes.**)

National Physical Laboratory, situated at Teddington, is one of the world's largest and best-equipped laboratories. It was first established in 1900, and functions as a central bureau of physical standards and as a research laboratory of industrial physics. In 1918 it became part of the Department of Scientific and Industrial Research and has the following Divisions: Aerodynamics, Applied Physics, Basic Physics, Control Mechanisms and Electronics, Electricity, Light, Mathematics, Metallurgy, Ship and Standards.

National Portrait Gallery, established in 1856, and now located in a building in St. Martin's Lane adjoining the National Gallery. Contains portraits of eminent people in history, literature, art, etc., and a valuable collection of medals and autographs.

National Trust, founded in 1895. "A non-profit-making organisation incorporated by Act of Parliament for the purposes of promoting the permanent preservation of lands and buildings of historic interest or natural beauty for the benefit and access of the people." As a consequence of gifts of public-spirited individuals the Trust now owns many acres of magnificent scenery and property, including mediæval castles, bird sanctuaries, ancient monuments, birthplaces and homes of famous men, and classic examples of domestic architecture, preserved for the enjoyment of present and future generations. Since 1946 lands and houses of interest to the nation may be given to the National Trust in lieu of death duties.

Nativity. There are three Nativity-Festivals in the Christian Churches, the Nativity of Christ on Dec. 25, the Virgin Mary on Sept. 8, and John the Baptist on June 24.

Natterjack, a curious warty, prominent-eyed, brown toad (*Bufo calamita*), having a bright yellow line down the middle of its back. It utters a muttering sort of croak, hence its name.

Naturalisation, the grant of British nationality to an alien. Before an application can be made to the Secretary of State for the grant of a certificate an alien must have qualified by 5 years' residence in the U.K. or service under the Crown, during the 8 years immediately passed.

"Nautical Almanac," published under the authority of the Admiralty, is always issued four years in advance, and contains information specially prepared for the use of navigators and astronomers. It first appeared in 1767.

Nautilus, a term now applied only to the pearly-shelled nautilus, the sole surviving example of the four-gilled section of the *Cephalopoda*. Its fossil relatives are called Ammonites. The spiral shell is divided into a number of compartments, the animal living in the last and largest chamber. There are three or four species, all living in tropical seas. The Paper Nautilus is not related to the Pearly Nautilus, belonging to the same order as the octopus.

"Nautilus," the name of the American nuclear-powered submarine which made the first voyage under the North Pole in Aug. 1958, having navigated a new north-west passage without stars, compass, radio, or radar but using a piece of equipment known as an "inertial navigator." (*See* **Inertial Navigation.**)

Nave is the body or main open portion of a cathedral or church, and extends from the chief entrance to the choir, or chancel, and is usually flanked by aisles. A nave, in mechanics, indicates the "hub" or central part of a wheel.

Neandertal, the name of the valley lying between Düsseldorf and Wuppertal, where in a limestone cave a now famous skull of a very early species of prehistoric man was discovered in 1856. Fossils of Neandertal man have been found over a wide area, and from archæological evidence he disappeared from Europe during the last North Polar Ice Age, about 25,000 years ago. *See also* **F33** (1).

Necromancy, "the black art," was in olden times much believed in, and supposed to be an occult power by which its practitioners could converse with the spirits of the dead and learn the future.

Negroes are the dark-skinned, woolly-headed races, natives of tropical Africa, or descendants of such natives. There are many different racial types, but the most typical Negroes are found in W. Africa—the Ashanti of Ghana, and the Yoruba of Nigeria. There are the Pygmies living in the forests north and south of the equator, the Bushmen of the Kalahari Desert, the Hottentots of South Africa, who however have largely lost their identity, the Bantu peoples, and many others. Their culture is rich in folk-lore, and they have a great gift for music and dancing. About 25 million people of Negro descent are in N. and S.

America, the European slave trade having taken them there from their homes in W. Africa.

Negus, the name given to any mixture of wine and water, and said to have been named after Colonel Francis Negus about 1714. The sovereign of Abyssinia is styled the Negus.

Nekton, term used to differentiate actively swimming aquatic organisms (*e.g.*, fishes) from the "drifters" or plankton.

Nelson Column, in Trafalgar Square, London, designed by Mr. William Railton, was chosen from among a number of designs—temples, obelisks and various sculptural groups—sent in as a result of a competition held in 1839. The erection of the column was begun in 1840. Twenty-six years later the lions designed by Landseer were set up at the foot of the completed column. The statue of Nelson himself was made by E. H. Bailey and the bronze reliefs at the base executed by Carew, Woodington, Ternouth, and Watson, representing the Battles of the Nile, St. Vincent, Copenhagen, and Trafalgar. Height 170 ft., executed in Portland stone instead of granite, as originally planned, at a cost of £46,000.

Nematodes, the roundworms or threadworms. Some parasitise man and domestic animals.

Nemean Games were instituted at Nemea in honour of Archemorus, and revived in 1226 B.C. They were celebrated every third year, and were finally given up in A.D. 396. The conqueror in contests of strength and agility was rewarded first with a crown of olives, and later with wreathed chaplets of parsley leaves.

Néné or Hawaiian Goose. At the Severn Wildfowl Trust at Slimbridge Mr. Peter Scott is trying to save this bird from extinction.

Neodymium, an element belonging to the rare earth metal group. Discovered by Welsbach in 1885.

Neon, inert gas present in air to the extent of about 1 part in 65,000. The crimson glow produced when an electric discharge passes through the gas is familiar in advertising signs.

Neoprene, generic name for a class of synthetic rubbers made from acetylene.

Nepotism, the bestowal of patronage by reason of relationship rather than of merit. It had its origin in the custom of certain Popes to enrich their families out of the offices of the Church.

Neptune. Apart from Pluto this is the most distant of the planets, estimated to be about 2,793 million miles from the sun, and taking about 165 years to revolve around it. Discovered by the German astronomer Galle on Sept. 23, 1846, after its existence had been predicted by Leverrier and Adams.

Neptunium, element 93, one of the four new elements discovered during the progress of the atomic bomb project in the second world war. Neptunium is formed when a neutron enters a nucleus of Uranium 238, and it decays radioactively to yield plutonium.

Neuroptera, an order of insects which includes lacewings, alder-flies, ant-lion flies, etc.

Neutrino, a neutral particle which carries energy and spin and although possessing little or no mass plays an important part in the interaction of neutrons and protons in the atomic nucleus. *See* **F12, 13**.

Neutron, a neutral particle present in all atomic nuclei except the hydrogen nucleus which is a single proton. Mass of neutron and proton in terms of electron-mass is 1838·6 and 1836·2 respectively. Neutrons and/or protons are termed nucleons. *See* **F10, 13**.

New Deal. The measures taken by President Roosevelt in U.S.A. in 1933 to overcome the great economic crisis which broke out at the end of 1929 and to restore the social security threatened by it. The measures were drawn up by a group of experts called a Brains Trust and they provided for recovery by a programme of public works, including large-scale construction of houses and large-scale assistance to farmers. Loans were granted and authorities formed to stimulate activities which reduced the workless from 17 millions to between 7 and 10 millions. Unemployment relief was regulated and enlarged; and social insurance (which for decades had been a subject of dispute, being held to be contrary to American principles of self-help) was introduced. The President claimed at the beginning of 1939 that the New Deal programme had been successful. The outbreak of the war prevented this being tested. But many of its changes have become a permanent part of American legislation. Certain parts were repealed by the U.S. Supreme Court as being unconstitutional.

Newgate Prison, now pulled down and replaced by the Central Criminal Court, opened in 1907, was situated near the point where once stood one of the old London city gates. There is a record of a prison upon this spot in the 13th century. Later a new one was built by the executors of Richard Whittington, but this was destroyed by the Great Fire in 1666. Still another new prison on this site was erected between 1778 and 1780. In the Gordon Riots of the latter year it was destroyed by fire and re-erected. It was not used as a prison after 1880.

News Letters were an early form of newspaper, popular in the time of Charles II. They consisted of items of news and gossip collected at the various coffee-houses and other places of public resort. They often included blank pages on which readers wrote their private letters.

Newspapers. The first news-books to be published at regular intervals in Britain appeared in 1662 with news of what was going on abroad translated from German and Italian news-sheets. Licence to print was obtained from the Star Chamber, which until its abolition in 1641 allowed only the printing of foreign news. With the lifting of the ban on domestic news the Press became free. In the reign of Queen Anne English newspapers employed writers of great intellectual power and versatility. Despite the newspaper tax introduced in 1712, the number of newspapers published in London in 1776 had increased to 53, though the standard of writing was below that of earlier times. The development of the Press was greatly assisted in the 19th century by the abolition of the "taxes on knowledge," by the introduction of the cheap postal system, and by improvements in printing, distribution, collection of news, and advertising. The *London Gazette*, founded in 1665 (and still appearing twice weekly as the official organ of the Government), is the oldest newspaper living. *The Times*, known throughout the world, began as the *London Universal Register* in 1785, and adopted its present title in 1788. The *Manchester Guardian*, once a provincial but now a national newspaper with a world-wide reputation, began as a weekly in 1821, and became a daily in 1855. The *Scotsman*, founded as a weekly in 1817 and established as a daily in 1855, and the *Glasgow Herald*, which began as the *Glasgow Advertiser* in 1783, are the leading Scottish newspapers. The London Press, which is national, publishes 10 morning, 3 evening, and 9 Sunday newspapers.

Newt, amphibians of lizard shape and mottled markings. There are three British species, the largest being the Great-Crested Newt (*Triturus cristatus*), which attains a length of 6 in.

Newton's Rings. Concentric circular rings, due to the phenomenon of interference, which are seen around the point of contact of a slightly convex lens on a flat plate of glass.

New Year's Day, Jan. 1. The first New Year's festival of which we have record is that constituted by Numa 713 B.C., and dedicated to Janus.

Nibelungenlied, the German epic of the 12th century comprising numerous mythical poems or sagas of which several English translations exist. These poems have been utilised with great effect as foundations for Wagner's famous series of operas comprised under the general title *Ring des Nibelungen*. *See* **G38 (2)**.

Nicene Creed, a summary of the principles of Christian faith, first issued in 325 by the Council of Nicæa (summoned by the emperor Constantine the Great) for the purpose of thwarting the Arian heresy and asserting the godhead of Christ. Date of Easter fixed at Council of Nicæa.

Niche, a recess or nook constructed for a statue or other special ornament. Such niches are numerous in the older ecclesiastical buildings, and usually contain the figures of saints or historic personages.

Nickel, silver-coloured metal, fairly soft though harder than iron. Chief source of the metal is the nickel sulphide in iron–copper pyrites

deposits in Ontario. Chief uses are: in electroplating, in coins, as an element in alloy steels.

Nicol Prism, a device for producing plane-polarised light. It consists of two pieces of Iceland spar cut and cemented together in a special way.

Nicolo, a large brass reed instrument, common in the 17th century, but now superseded by the bassoon.

Nicotine, an alkaloid substance contained in the tobacco plant. It is a clear, colourless oil and highly poisonous, paralysing the nerves. In the act of smoking tobacco, however, only an infinitesimal quantity is absorbed in the smoke.

Niello Work was in considerable vogue in the Middle Ages, and is said to have suggested the idea of engraving upon copper. It was produced by rubbing a mixture of silver, lead, copper, sulphur, and borax into engravings on silver, and some highly decorative results were obtained.

Night-heron, a stocky, short-legged heron of black and white plumage, red eyes, and yellowish legs, crepuscular except in breeding season, and an occasional visitor to Britain.

Nightingale, a familiar singing bird which visits the southern counties of England every summer, and is sometimes found as far north as Yorkshire. It is a shy bird, not often seen, but the song of the male, usually heard in the late evening or at early morn, is of remarkable sweetness and variety. After its wooing period is over its song ceases.

Night-jar, nocturnal insectivorous bird, owl-like in appearance, with mottled brown plumage of "dead leaf" pattern. It is a common breeding visitor to the British Isles, Apr. to Sept., and lays its eggs on bare ground.

Nihilism, the name commonly given to the earliest Russian form of revolutionary anarchism. It originated in the early years of the reign of Alexander II. The term was first used by Turgenev in his novel *Fathers and Children* published in 1862.

Nile, Battle of the, fought in 1798 between the English and French fleets in Aboukir Bay. Nelson annihilated Napoleon's fleet and the latter and his army were stranded in Egypt.

Nimbus, a circlet of light depicted round the heads of saints or divine personages in ancient art; also name of dense dark "rainy" cloud.

Nirvana, in Buddhism, is the condition of supreme attainment, and involves the extinction of every form of desire, ambition, or unrest. It is the holy state. (*See* **Buddhism.**)

Nitre *or* **Saltpetre,** is now mostly manufactured by the double decomposition of sodium nitrate and potassium chloride. Its chief use is the manufacture of gunpowder and fireworks. It has been manufactured in England since 1625.

Nitrogen, a non-combustible gas devoid of taste or smell, and constituting nearly four-fifths of the atmospheric air.

Nitro-Glycerine, an explosive yellow fluid produced by mixing small quantities of glycerine with a combination of one part of nitric acid and two parts of sulphuric acid. By itself it is a dangerously explosive substance to handle. In 1867, Nobel produced dynamite, a safe explosive made by absorbing nitro-glycerine in kieselguhr.

Nitrous Oxide, a compound of nitrogen and oxygen possessing mild anæsthetic power. It was the first of the inhalation anæsthetics to be used.

Nobel Prizes. A list of Nobel Laureates is given at the end of this Section.

Noble, an old English gold coin current in the 14th century, and of the value of 6*s*. 8*d*.

Nocturne, a short piece of music, romantic in character, generally for the pianoforte. The nocturne was invented by John Field, from whom Chopin borrowed the idea. After this the nocturne became popular all over Europe, being known in Italy as "notturno" and in Germany as "nacht-musik."

Nonconformists *or* **Dissenters,** are all such religionists as do not conform to the doctrine of the Church of England. Up to the passing of the Act of Uniformity in 1662 they were called "Puritans." At various times the Nonconformists have been rigorously persecuted, but in later times the utmost toleration has been granted to them. The oldest bodies of Nonconformists are the Presbyterians, Baptists, and Independents. The Methodists date from 1739. (*See also* **Baptists** *and* **Methodists.**)

Nones were dates of the Roman calendar which fell on the 5th of each month, excepting Mar., May, July, and Oct., when they fell on the 7th.

Nonet, a musical composition for nine voices or instruments.

Nonjurors were High Church bishops who refused to swear allegiance to William III. in 1689, contending that James II. had been unjustly deposed.

Non Nobis Domine! ("Not unto us, O Lord!"), a musical canon, sung as a grace at public feasts (traditionally attributed to Byrd).

Northmen were the early inhabitants of Scandinavia, famous as sea adventurers and pirates. Their attacks on Britain and other parts of northern Europe prior to the 11th century were often successful, and they established settlements in the islands off the Scottish coasts, and in the north of France, where they founded the duchy of Normandy, from whence came the Normans who conquered England in the 11th century.

North-East Passage, from the North Atlantic to Bering Strait has been rapidly developed by the U.S.S.R. in recent years as a northern sea route to render accessible vast areas of northern Siberia. Attempts to find a north-east passage were made by Englishmen and Dutchmen in the 16th century but they were always defeated by the ice, for the sea is completely frozen for some 3,000 miles for 9 months of the year. A Swede succeeded in sailing from Europe to Japan via the Arctic in the late 19th century and several Russian expeditions have been made. (*See also* **Arctic Exploration.**)

North-West Passage, from the Atlantic to the Pacific through the Arctic Seas, has been the dream of navigators for centuries. Attempts to find it were made in the 16th and early 17th centuries by John and Sebastian Cabot, Frobisher, Gilbert, Davis, Hudson, and Baffin. Two centuries later Ross, Parry, Franklin, and others made the attempt; but it was not until 1903–5 that Amundsen, discoverer of the South Pole, made the complete voyage. The American nuclear-powered submarine *Nautilus* opened up a new short sea route between the Atlantic and the Pacific when she made her epic voyage under the North Pole in Aug. 1958.

"**Not Proven,**" a verdict peculiar to Scottish law under which, in criminal cases where, the evidence not being sufficient to fully demonstrate the charge made, a prisoner is given the benefit of the doubt and set free, and cannot be retried even if later evidence of his guilt be discovered.

Notre Dame, the famous Paris cathedral, was founded in 1163, and is one of the finest specimens of Gothic architecture in Europe. The best descriptions of the buildings are to be found in Victor Hugo's "Hunchback of Notre Dame."

November, the 9th month of the year originally, but from 713 B.C., when Numa added Jan., and Feb., it became the 11th month.

Noyade, a mode of execution by drowning practised during the Reign of Terror in France at Nantes. The victims were set afloat in a boat with a movable bottom.

Nuclear Energy. *See* **F50.**

Nucleus, Atomic. *See* **F10.**

Numismatics, the science of coins and medals, has proved a fascinating study to many, and has resulted in the discovery of valuable historic evidence at various times. The difference between a coin and a medal is that the former is a piece of money, while the latter commemorates some person or event. The Royal Numismatic Society, founded in 1838, published the *Numismatic Chronicle,* and the British Numismatic Society, founded in 1904 to deal specially with the history of British coins, publishes a *Journal.*

Nunc Dimittis, a familiar hymn ("Now lettest thou thy servant depart in peace") forming part of the Evening Service in the various Christian Churches. (Luke ii, 29.)

Nuncio, a representative of the Pope sent on diplomatic missions. Nuncios were permanently established during the 16th century.

Nunneries, convents for the exclusive residence of women living under vows a life of religious observance. They are common in Roman Catholic countries, and there are still a few in

Britain. The first English nunnery was founded at Folkestone in 630, and up to the dissolution of the monasteries such institutions were numerous.

Nuremberg Trial. On Nov. 21, 1945, an International Military Tribunal, consisting of one American, one British, one Russian, and one French member, began the trial of twenty-four Nazi leaders. There were four counts: the conspiracy of Nazism; wars of aggresssion; war crimes; and crimes against humanity. Twelve were condemned to hanging of whom ten were hanged on Oct. 16, 1946. Goering committed suicide; Bormann has never been found; Papen, Schacht, and Fritsche were acquitted. The rest received varying terms of imprisonment.

Nuthatch, name of a number of tree-creeping birds, plump, with short tail, bluish-grey plumage, and black stripe under eye. Nest in holes and wedge nuts in bark of trees, hammering them to get a kernel. There are three European species, one, *Sitta europaea*, resident in England.

Nutmeg, the kernel of the stone of a tropical fruit, used as a spice and highly aromatic.

Nyctea, a kind of snow-owl of large size and white plumage found in the Arctic and Sub-Arctic latitudes of Europe, America, and Asia.

Nylon, a generic term for any long-chain synthetic polymeric amide which has recurring amide groups as an integral part of the main polymer chain, and which is capable of being formed into a filament in which the structural elements are orientated in the direction of the axis. The first nylon of commerical interest was made in 1935, and the world's first nylon factory—in the United States—began production in 1940.

Nymphæa, the white water-lily, dedicated by the Greeks to the water nymphs.

O

Oak, a tree of the genus *Quercus*, including some 300 species distributed over the northern hemisphere and into the tropics. Two species are native to Britain, where the oak is the commonest tree (1 in 3)—*Q. petræa*, which has long-stalked leaves and acorn-cups sitting directly on the stem, and *Q. robur*, which, in contrast, has long-stalked acorn-cups and stalkless leaves. Oak timber is much prized for its strength and durability, and from the time of the Spanish Armada to Nelson's day was in great demand for naval construction. It has always been used for building, flooring, furniture, and cabinet work. The oak is attacked by many insects, the round nut-like oak galls, or oak-apples, being produced by the sting of certain minute gall wasps.

Oak Boy, a member of a body of Irish insurgents (who wore oak sprigs in their hats) who rose in 1746 against forced labour on the roads and a stricter exaction of tithes.

"**Oaks,**" the name of a famous race for three-year-old fillies run at Epsom two days after the "Derby."

Oakum, loose hemp and untwisted ropes, in the preparation of which prison labour used to be largely used in England.

Oasis, the name given to any fertile spot in a desert region. Such spots are fairly numerous on the Sahara and Libyan deserts, and some of them are extensively peopled and successfully cultivated.

Oats, a well-known cereal product, probably native to Asia, but cultivated with considerable success for many centuries in Scotland and England. The United States also produces large quantities. Cakes and porridge of oatmeal are common articles of food in many countries, especially in Scotland.

Obbligato, originally, as the name suggests, a part which must be played (= obligatory). Now, by a curious misuse of the word, a part which need not be played, *e.g.*, a "violin obbligato"—additional to the pianoforte accompaniment and may be omitted if desired.

Obelisk, a tapering monolithic column, square at the base and pyramidal at the top, regarded by the ancient Egyptians as a sacred stone and usually found at the entrance to the sun temples. Twelve were transported from Egypt to Rome and set up at various times: there is one in the Place de la Concorde in Paris, and one on the Thames Embankment in London—Cleopatra's Needle—originally erected at Heliopolis, centre of the sun-cult, by Tuthmosis III about 1500 B.C.

Obi, the Japanese name for a coloured sash commonly worn by Japanese women, and tied with a large bow at the back of the waist.

Obit, the date or the anniversary of a person's demise; the term is used also in reference to a service of religious character celebrated on such an occasion.

Oblation, a gift offered in worship, referring especially to the bread and wine given by the laity for the Eucharist.

Oblivion, Act of, was the act of "free pardon and oblivion" in respect of "all treasons and state offences" committed between 1637 and 1660 (the Civil War and Commonwealth period), excepting from it the "regicides" and certain priests.

Oboe, (old spelling: hautbois). A reed woodwind instrument rather similar to the clarinet in appearance, but having a double reed. The tone of the oboe is more thin and penetrating than that of the clarinet. The tenor oboe is called the Cor Anglais, while the bass oboe is the Bassoon. There is also a "double-bass" oboe called the contra-bassoon.

Observatories existed in ancient Babylon and Egypt. They were erected on tombs and temples. The most famous observatory of Egypt was that of Alexandria, erected by Ptolemy Soter, 300 B.C. It was not until the 16th century, however, that an observatory adequately equipped for astronomical investigations was built. This was at Cassel. Tycho Brahe's observatory at Uranienburg was erected in 1576. The Royal Observatory at Greenwich was completed in 1675. Mount Wilson Observatory in California has had a 100-in. reflector telescope working since 1917 but Mount Palomar Observatory, also in California, has a 200-in. reflector—the largest in the world, completed in 1949—which can reveal remote galaxies out to a limiting distance of 2,000 million light years. It is known as the *Hale* telescope in memory of Dr. George Ellery Hale, the founder of the Mount Wilson Observatory. A 98-in. telescope, the *Isaac Newton*, is being installed at the new Royal Greenwich Observatory at Herstmonceux Castle. A number of observatories are devoted to meteorological and geophysical work, the most important in the British Isles being those at Eskdalemuir (Dumfries), Kew, Lerwick, and Valencia (Eire). (*See also* **Astronomy** *and* **Telescopes.**)

Obsidian, a form of volcanic rock of vitreous structure, and usually a silicate of aluminium, lime, magnesium, etc. Produced when acid lavas are rapidly congealed, it is usually black and fractures like pitch.

Ocarina, a simple kind of musical instrument usually made of terra-cotta. The whistle mouthpiece is at right angles to the bulbous body, in which are a number of finger-holes. The tone resembles that of a mellow flageolet.

Occultation, in astronomy, refers to the concealment of a celestial body by the passing before it of some other heavenly body. The most frequent occultation is that of a fixed star by the moon.

Occultism, originally the practice or study of the occult or secret sciences, including alchemy, astrology, magic, necromancy, etc.; but in recent times referring also to theosophy, spiritualism, palmistry, and so forth.

Ocean comprises the great body of water which covers five-eighths of the surface of the earth, and has an average depth of 2 miles. The principal oceans are the Pacific, Atlantic, Indian, and Arctic. *See* **F9.**

Ocean Currents are well-defined streams running over certain portions of the ocean and caused mainly by wind-friction, slope of the sea surface and differences in density of the water, all movements being influenced by the deflective forces due to the earth's rotation. The climatic importance of the great ocean currents is that they constitute one of the means whereby heat is transferred from lower to higher latitudes.

Ocelot, usually called the leopard cat, is found in S. America. It is about 4 ft. in length, including tail, and of a grey or tawny colour and spotted.

Ochres, the name of a number of natural earths impregnated with mineral colourings, chiefly silica and alumina. They include iron ochre, yellow ochre, and plumbic ochre, being respectively oxides of iron and lead. Ochres are largely used in the making of paints.

Octane Number, the index of the knock-rating of petrol.

Octarch, the kings of the English heptarchy, Hengist (455) being the first, and Egbert (800) the last.

Octastyle, in architecture, is a term applied to an eight-columned portico such as that of the Parthenon of Rome.

Octateuch, meaning a collection of eight books, is a term generally applied to the first eight books of the Old Testament.

Octave, an interval of an eighth (*see Interval*). The interval between one note and the same note pitched higher. A pure note is an air vibration of fixed frequency. Middle C is thus 256 vibrations per second. The note an octave above middle C is exactly twice this frequency, *i.e.*, 512 vibrations per second.

Octet, a musical composition for eight voices or instruments.

October, the 10th month, but the 8th in the old Roman calendar. It was held sacred to Mars.

Octopus, a genus of marine molluscs with eight tentacles that bear suckers.

Octrois are special taxes levied on articles of food before entering a city. They have been established in France from early times, and still exist, though at various periods they have been suspended.

Odes were originally extempore compositions sung in honour of the gods by the ancient Greeks and Romans. They were divided into three sections: strophe, antistrophe, and epode. All the most famous ancient odes—of Anacreon, Pindar, Horace—were composed before the Christian era. Among the best-known English odes are those of Milton, Dryden, Collins, Gray, Wordsworth, and Keats.

Odeum, a small theatre for the recitation of musical compositions, generally contiguous to a larger public theatre; thus the odeum of Athens in classic days adjoined the theatre of Bacchus.

Odyssey, Homer's famous epic poem setting forth the incidents of the wanderings of Odysseus on his way back to Ithaca after the Siege of Troy. *See* Greek Myths and Legends.

Œcumenical Council, a general council of the Christian Church summoned when important questions of Church doctrine and policy are to be decided. The early councils were predominantly Greek and convoked by the emperor. Those summoned by the Pope are called Lateran Councils and their decisions are not binding on the rest of Christendom. Only 20 Œcumenical Councils have been held in the history of Christendom; the first being the Council of Nicaea, 325, and the most important being the Council of Trent, 1545–63. Pope John XXIII convened an Œcumenical Council in Jan. 1959.

Œil-de-Bœuf, a term in architecture denoting openings, usually round or oval, in friezes, roofs, or domes of buildings, designed for the admission of light.

Ohm's Law, was propounded by Dr. G. S. Ohm in 1827 and now usually expressed in the equation: voltage = current (in amps.) × resistance (in ohms). The *ohm* is the practical unit of electrical resistance. *See also* **N12** (2).

Olbers' Comet was discovered in 1815 by Olbers the German astronomer. Olbers also discovered the asteroids Pallas and Vesta (1802–07).

Old Red Sandstone, a synonym for the Devonian system. *See* **F20.**

Olefines, a series of hydrocarbons, in which the hydrogen atoms are double the number of those of carbon. The first member of the series is ethylene.

Oleic Acid, an important fatty acid present in lard and olive- and cotton-seed oils. Used in soap-making. Olein is the ester formed by the reaction of oleic acid and glycerine.

Oleographs, the name given to reproductions of paintings in oils, the colours of the original being more or less faithfully copied. The process is one that closely resembles chromolithography.

Oleometer, an instrument for ascertaining the specific gravity of oil. (*See* **Hydrometer.**)

Oléron Laws or Judgments, were a code of maritime laws, introduced into England in the reign of Richard I. in the 12th century. Oléron is an island off the west coast of France, opposite the mouth of the Charente.

Olive. This small tree, whose fruit yields olive oil, is a native of the eastern Mediterranean countries, but has been introduced into cultivation elsewhere. Its oil is used for cooking, in packing sardines, and in soap making; the green unripe fruit is pickled for table olives.

Olympiads were periods of four years which elapsed between each celebration of the Olympic games, instituted in honour of Zeus by the Greeks, and held at Olympus in the Peloponnesus. These festivals included competitions in literature, art, drama, rhetoric, music, and gymastics, and they were continued, with intervals, from 776 B.C. to A.D. 394. Athletic revivals have taken place at Athens 1896, Paris 1900, St. Louis 1904, London 1908, Stockholm 1912, Antwerp 1920, Paris 1924, Amsterdam 1928, Los Angeles 1932, Berlin 1936, London 1948, Helsinki 1952, Melbourne 1956, and it is planned to hold the 1960 Olympiad in Rome. (*See* **U36** for 1956 Results.)

Omega, the last letter of the Greek alphabet, and widely adopted in literature in its figurative sense as indicating the end of anything.

Onyx, a kind of silica built up of different-coloured layers, which are parallel and straight (not curved as in agate).

Oolite, a geological term for the Jurassic oolitic limestones existing through a long stretch of country extending from Yorkshire to Dorsetshire. It abounds in fossils of molluscs and reptiles. The term "oolite" derives from the fact that these rocks are made of egg-shaped particles of calcium carbonate.

Opal, a mineral consisting of hydrous silica, occurring in numerous varieties and colours. Precious opal displays a beautiful internal opalescence, the result of the interference of light waves on the surfaces of layers differing in their water-content. Opal miners are called gougers. Chief source, the Andamooka and Coober Pedy fields of South Australia.

Opera derives, like Drama, from the religious plays of mediæval times. These plays were always accompanied by music, but, whereas Drama has relegated music to the entr'acte, Opera has developed it to the point of being the most important feature of the performance. The first true opera was produced at Florence in 1597. It was written by Rinuccini and composed mainly by Peri and called *La Dafne*. Rinuccini and Peri followed this in 1600 with *Euridice*—the earliest opera of which we have a complete record. The first opera house was opened in Venice by Caralli in 1637. Cardinal Mazarin tried to introduce Italian opera into France, bringing in Caralli in 1660, but the experiment was a failure. Native French opera began in 1672 under the patronage of Louis XIV. with Lulli's *Les Fêtes de l'Amour et de Bacchus*. In England musical plays were being performed at this time, but the first real opera was Purcell's *Dido and Æneas* written in 1689. At this time Scarlatti was writing operas in Naples and shaping the Italian opera into the form in which we know it to-day. Handel produced nearly forty operas in thirty years, his first being *Rinaldo* at the Haymarket, London, in 1711. The comic opera seems to have originated in Naples. The first English comic opera, the *Beggar's Opera* by Gay, was given in London in 1727. Mozart, after producing his magnificent *Idomeneo* at the age of 25, wrote a succession of comic operas: *Seraglio* (1782), *Figaro* (1786), *Don Giovanni* (1788), *Cosi fan tutte* (1790). These laid the foundations for all future comic opera. *The Magic Flute* (1791) was the first of what might be called "opera for the people." Beethoven made a single excursion into opera: *Fidelio* (1805). Rossini is best known for *The Barber of Seville* (1816), a comic opera, although his reputation was made with a serious opera *Tancredi* (1813). The operas of Bellini are rarely performed outside Italy, but these had considerable influence on the work of Chopin and Liszt. Bellini's successor Donizetti is best known for his comic operas *Don Pasquale* and

L'Elisir d'Amore. This period in French opera is best represented by Auber's *Fra Diavolo*. German opera, slow to take root, developed at this time through Weber and Meyerbeer to Wagner, whose first important opera, *Rienzi*, was performed in 1842. The complete *Ring* was first given at Bayreuth in 1876 and Wagner's last opera, *Parsifal*, in 1882. The most successful exponent of comic opera at this time was Offenbach, although Strauss in Vienna and Sullivan in England enjoyed considerable local success. Italian opera underwent a revival with the advent of Verdi. Of his earlier operas, *Rigoletto* (1851), *Il Trovatore* (1853) and *La Traviata* (1853) alone have retained their popularity. *Aïda* (1871) is a more mature work, while *Otello* (1887), and *Falstaff* (1839), for which Boito wrote the libretti, are works of high merit. Several French operas of this period retain their popularity: Gounod's *Faust* (1859), Bizet's *Carmen* (1875), Massenet's *Manon* (1884), Saint-Saëns *Samson et Dalila* (1877). In 1890 Mascagni achieved startling success with *Cavalleria Rusticana*. This was followed almost immediately by Leoncavallo's *I Pagliacci* and the two are now inseparable. Of the operas produced in the 20th century, the most popular have been Puccini's *La Bohème* (1896), *Tosca* (1900), *Madame Butterfly* (1904), Richard Strauss's *Der Rosenkavalier* (1911) and Debussy's *Pelléas et Mélisande* (1902).

Ophicleide, a brass instrument invented in the 19th century. Mendelssohn and Berlioz wrote scores for the ophicleide, but the instrument has fallen out of general use.

Opium was known to the ancients, and used by them as a medicine. It is obtained from the white poppy, the unripe "head" or seed capsule of that flower yielding a juice which when dried becomes the opium of commerce. The poppy is largely cultivated in India, Persia, Turkey, Macedonia, and China for the sake of this juice, which yields various alkaloids, such as morphine, narcotine, thebane, etc. Laudanum is a tincture of opium.

Opium War, a war (1839–42) between Great Britain and China, due to the dissatisfaction of the former with the treatment of British subjects in China. The immediate cause was the attempt of China to stop the importation of opium. It was concluded by the treaty of Nanking, which established the "treaty ports" of China. Hong Kong was ceded to Great Britain.

Opossum, marsupial mammals found in the more southerly of the United States, South America, and Australasia. They are arboreal except for the water-oppossum, which eats fish.

Optics, the branch of physics which investigates the nature and properties of light and the phenomena of colour. Burning lenses were known to the ancient Greeks and Ptolomy wrote a treatise on optics A.D. 150. Lenses as visual aids were known in ancient China but eyeglasses were not in use until the 13th century. Spectacles were in more general use after the invention of printing in the 15th century. The camera obscura was invented in the 16th century and the telescope and microscope at the beginning of the 17th century.

Opus, a single work of serious music. Most serious composers list their works in this way; *e.g.*, Opus 1, Opus 2, etc. If several pieces are included in a single opus they are listed as follows: Opus 1, No. 1.

Oracles were in ancient times supposed to be words spoken by the gods, and it was the custom on important occasions to consult them about the future. The Greeks had the Oracles of Zeus at Dodona, and Apollo at Delphi, while the Romans consulted the Oracles of Mars, Fortune, and others.

Orange, a fruit growing in most sub-tropical climates and in universal demand. It is grown on an evergreen tree that attains a height of about 20 ft. at maturity.

Orangemen, members of an Irish society formed in Ulster in 1795 to uphold Protestantism. Their name is taken from King William III. (Prince of Orange) who defeated James II. at the Boyne in 1690. The society has branches in most English-speaking countries but flourishes chiefly in Ulster.

Orang-utan, one of the largest of the anthropoid apes, found only in Borneo and Sumatra. When full-grown it stands over 4 ft. in height and weighs about 150 lb.

Oratorio, a sacred work for solo voices, chorus, and orchestra. The word applies to a special composition and not to a musical setting for a normal part of the church service.

Orbit indicates the course of a planet round the sun. All the planetary orbits are elliptical.

Orchestra, a group of instruments and instrumentalists whose playing is under the direction of a conductor. The composition of a typical symphony orchestra is as follows: STRINGS: 1st Violin (16), 2nd Violin (16) Viola (12), Violoncello (12), Double Bass (8). WOOD-WIND: Flute (3–4), Piccolo (1), Oboe (3), Cor Anglais (1), Bass Oboe (1), Clarinet (3), Bass Clarinet (1), Bassoon (3), Contra-bassoon (1). BRASS: Horn (6), Trumpet (5), Trombone (3–4), Tuba (2). PERCUSSION: Timpani (3–6), Side Drum (1), Bass Drum (1), Cymbals (1), Harp (2).

Ordeals, or **Trials by Ordeal**, were known in England in the time of the Saxons, and existed down to 1218, when they were abolished. The ordeals were usually of fire, water, or poison. The accused would be set to handle red-hot iron, be cast into water, or made to partake of poison, and unless he could withstand these tests he was condemned as guilty.

Orders, Holy, in the Roman Catholic Church are of seven kinds, extending from door-keepers, exorcists, readers, and acolytes, in the minor class, to deacons, priests, and bishops of major rank; while in the Anglican Churches there are only three—deacons, priests, and bishops.

Orders in Council are issued by the sovereign on the advice of a few selected members of the Privy Council. They must not seriously alter the law of the land. Another class of Orders in Council are issued by authority of an Act of Parliament for the carrying out of its provisions.

Ordination, the ceremony of installing ministers or clergymen in clerical offices, has existed from the earliest times. In the Anglican and Roman Catholic Churches the rites of Ordination are performed by bishops; among Nonconformists the power of ordination rests with the governing bodies of the different Churches.

Ordnance Office was an old Government department entrusted with the supply of weapons and materials of war from the time of the archers to the days of guns and explosives. After the Crimean campaign, when the administration of the Ordnance Board was shown to be very defective, the office was abolished, and its duties vested in the War Minister.

Ordnance Survey, an authorised survey of Great Britain entrusted to a special body of Royal Engineers and civilian experts, by whom maps and charts are from time to time produced, showing the full details of the geographical, geological, and industrial condition of the country. The scale adopted for counties is 6 in. to 1 mile, and 1 in. to 1 mile for the general map of the kingdom. The Ordnance Survey Department now comes under the Ministry of Agriculture, Fisheries and Food.

Organ is a musical wind instrument of ancient origin whose tones are produced by the vibrations of air in pipes of varying length. Basically, an organ consists of a number of pipes grouped in rows or ranks according to their special tone-character. The air is fed by bellows or, in modern organs, by a rotary fan, electrically driven. Each rank is controlled by a slider, and the knob that controls the slider is called a stop. The organist pulls out the stops to give the tones he wants, the other pipes being kept out of action by the slider. When a particular note on the keyboard is depressed the player may hear, by pulling out the appropriate stop, not only the normal pitch but the note in several octaves. A stop of which the notes are of normal pitch is called an 8-foot stop, a 16-foot stop would give an octave lower, a 4-foot stop an octave higher, and a 2-foot stop two octaves higher. The hand keyboard is called a manual, and the foot keyboard the pedal board. The basic tone of an organ is its diapason tone, and is normally of 8-foot length and pitch. Most large organs have

four manual keyboards and one pedal board. The most important manual is the great organ which comprises the majority of basic stops. The next in importance is the swell organ, so called because the pipes are enclosed in a box fitted with movable shutters operated by a swell-pedal. The effect provides a controlled crescendo or diminuendo. The tone of a typical English swell has a reedy character. The third manual controls the choir organ—a collection of stops suitable for vocal accompaniment. The fourth manual controls the solo organ—a group of stops which, singly or in combination, may provide a solo melody which the remainder of the organ accompanies. The pedal keyboard controls most of the bass stops. In some very large organs there is a fifth manual controlling the echo organ. This is a small group of stops usually set high in the roof of the building to give the effect of distant music. Most church organs have two or three manuals. Modern cinema organs may have some normal stops but rely chiefly on a number of effects unknown to the straight organ.

Orgies were originally secret celebrations in honour of Bacchus, and noted for the wild licence displayed by the celebrants.

Orguinette, a musical instrument composed of reeds which are played upon by a bellows. A strip of paper passes over the holes of the reeds, moved by a crank, and the paper is cut into holes to represent the required sounds. As the rollers turn the bellows the melody is "ground out."

Oriel College, Oxford, derives its name from a building called "l'Oriole" which stood on its site; was founded by Archdeacon Adam de Brome in 1326.

Oriel Window is a window projected from the front of a building, rectangular, triangular, or pentagonal. The ordinary bay window and bow window are varieties of Oriel. When an Oriel window does not reach to the ground it usually rests upon moulded sills supported by corbels.

Oriflamme, the name of the original banner of the abbey of St. Denis, and adopted by Louis VI. as his standard. It remained the national emblem of France for three centuries. The flag was of red silk, the outer edge being cut in the form of flames.

Origenists, a sect of religionists who were followers of Origen, who lived in the 3rd century. They believed that men's souls were created before their bodies, that the celestial bodies had souls, and that Christ was the Son of God only by adoption and grace. The Council of Constantinople in 553 condemned Origen's doctrines.

Original Sin, according to Christian doctrine the corruption that is born with us, as a result of Adam's fall.

"Origin of Species" (1859), the title of Darwin's famous work—by many considered to be the most important book of the 19th century.

Orioles, brilliantly coloured birds, members of the passerine family *Oriolidæ*, found in the tropical regions of Asia, Africa, and Australia. The golden oriole, perhaps the most beautiful of them all, with brilliant yellow plumage, black wings and tail, winters in Africa, visits England, and is known to have nested here.

Orion, a famous constellation of the heavens, comprising nearly a hundred stars, all visible to the naked eye. It contains three stars of the second magnitude in a line, and these are called "Orion's Belt."

"Orlando Furioso," the title of Ariosto's 16th-century epic poem, describing the doughty deeds of Orlando and other knights of the Charlemagne period.

Orleanists, members and supporters of the House of Orleans (1773–1850), of which King Louis Philippe was a member.

Ormer, a shellfish (*Haliotis tuberculata*) which occurs in the Channel Islands and on parts of the French coast. It is considered a great delicacy.

Ormulum, a version of the Gospels and Acts made by Orm, an ecclesiastic of the 12th century. It is metrical and exists in manuscript in the Bodleian Library.

Ormuzd, the spirit of good according to the Zoroastrian religion, represented as eternally warring against evil and personating purity of life.

Ornithology, the branch of Zoology which treats of the structure and habits of birds.

Ornithorhynchus. (*See* **Duck-bill.**)

Orphrey, the name of an ornamental border of gold and silver embroidered on ecclesiastical vestments.

Orrery, an instrument used in the 18th and early 19th centuries which showed the motions of the planets round the sun and the satellites round their primaries. The first orrery made was named after Charles Boyle, Earl of Orrery.

Orthoptera. The large order of insects including grasshoppers, crickets, locusts, mantises, stick insects, cockroaches, etc. These insects have biting mouth parts, and wings, if present, are in two pairs, the front pair being thickened to protect the membranous hind wings which are folded under the front ones when at rest.

Osborne House, near Cowes, in the Isle of Wight. Queen Victoria's favourite winter-residence, and where she died. It was given to the nation by Edward VII., and is now a convalescent home for Service officers. The grounds and State apartments are open to the public on certain days.

Oscar, the name of the gold-plated statuette awarded by the Academy of Motion Picture Arts and Sciences, of Hollywood, U.S.A., for the highest achievement of the year in film production.

Osier, a species of willow growing in damp soils and yielding branches utilised in basket-making.

Osmium, a very hard, bluish-white metal of the platinum group and one of the heaviest of known metals. It is obtained from certain sands of South America, California, Australia, and Russia. The alloy of osmium and iridium (osmiridium) provides long-wearing tips for gold fountain-pen nibs.

Osmosis, The process by which absorption of liquids through semi-permeable membranes takes place. A solution exerts osmotic pressure (O.P.) or suction in proportion to concentration but also depending on kind of dissolved substance. The roots of the higher plants are covered with fine root-hairs, within the cell-walls of which the sap is normally of a higher concentration than the dissolved matter in the surrounding soil. The root-hairs, therefore, draw into themselves these weaker salt-solutions. (The explanation of water and salt exchanges is complicated by the selective ability of some cells (*e.g.*, roots) to accept or reject particular dissolved substances along with the water. The absorption of salts by a plant is selective, each plant selecting through the semi-permeable membranes of its root-hairs those substances which are most suited to itself.)

Osprey, a large bird of prey, wing span 5 ft., widely distributed over all northern latitudes. It used to breed in Scotland, and did so again in 1959. It is invariably found near water and builds its nest on rocky cliffs, treetops or ruins. Feeds on fish.

Ostrich, the largest living bird, related to the rhea, emu, and extinct moa, now found only on the sandy plains of Africa and parts of S.W. Asia. The male has beautiful white plumes on wings and tail. The wings are useless in flight, but the birds have a fleetness of foot exceeding that of the swiftest horse. An ostrich's egg weighs 3 lb.

Otary, any seal which has external ears (as opposed to the *true seals* which lack them.) The eared seals make up the family *Otariidæ*, which includes the Sea-Lion and the Fur-seal of the N. Pacific.

Otter, an aquatic carnivorous mammal widely distributed over Europe, and at one time very common in England and Wales. Otter hunting, indeed, is still a country sport in some districts, and a breed of dogs called otter-hounds is kept for the purpose. The otter averages about 2 ft. in length, exclusive of tail, has web-feet, and is a very expert swimmer.

Ounce, a carnivorous member of the cat family, spotted like a leopard and having a long bushy tail. It is only found at high altitudes on the Himalayas, and is often called the "snow leopard."

Outcrop. Where a seam of rock appears at the surface of the ground, there is an outcrop of the particular rock. Outcrop coal is surface coal; the mining of such coal is called open-cast mining.

Overlord, a member of the House of Lords appointed to supervise and co-ordinate two or more ministries in the Churchill Government of 1951–53.

Overture, introductory piece to an opera or oratorio, often including the main themes to be elaborated later. Many so-called overtures have been composed as separate concert pieces.

Oviparous, a zoological term referring to such mammals, birds, reptiles, and fishes as bring forth eggs to be hatched outside the body of the parent.

Ovipositor, the organ by means of which the females of certain arthropods deposit their eggs.

Ovoviviparous, a zoological term applied to such animals as produce eggs which are hatched in the body of the parent; an example is the viper.

Owens College, Manchester, was founded by means of a bequest of £100,000 by John Owens, a Manchester merchant, who died in 1846. The college began in 1851, and formed the nucleus for the Victoria University of Manchester, established in 1880.

Owls, nocturnal birds of prey, distributed over the greater part of the world. Their forward-looking eyes, embedded in rings of feathers, give them a characteristic "owl-like" appearance, and their plumage, usually a mottled blend of browns and greys, is so soft that their flight is almost noiseless. Owls live on small mammals, reptiles, birds, insects, and fish, and are very valuable birds to the farmer. British owls include the barn owl (screech owl), short-eared owl, long-eared owl, tawny owl, little owl.

Ox, the popular name of the mammals included in the genus *Bos*. They are hollow-horned ruminants and hoofed quadrupeds, and include the various classes of domestic cattle as well as the different wild species. The adult male is called a bull, the female a cow, and the young a calf. The best-known breeds of domesticated cattle are the Durham or Shorthorn, the Angus, the Jersey, Ayrshire, Suffolk, and Hereford.

Oxalic Acid, an organic acid obtained from numerous plants, such as sorrel and rhubarb, and produced artificially for commercial purposes from sawdust, treated with caustic potash or caustic soda. It combines with metals to form oxalates.

Oxford Clay, a geological formation consisting of a bed of blue clay hundreds of feet thick, and forming the lower portion of the Middle Oolite series of the Jurassic. It makes good bricks.

Oxford University. The first indication of organised teaching at Oxford was in 1133 when Robert Pullen, the theologian from Paris, lectured there. Allusions to Oxford as a fully equipped university only occur after 1163. The earliest colleges to be founded were University College (1249), Balliol (about 1263), Merton (1264). In 1571 the university was reorganised and granted a Charter of Incorporation by an Act of Elizabeth. Other colleges, halls, and societies with their dates of foundation are: All Souls (1438), Brasenose (1509), Christ Church (1546), Corpus Christi (1517), Exeter (1314), Hertford (1874), Jesus (1571), Keble (1868), Lincoln (1427), Magdalen (1458), New College (1379), Oriel (1326), Pembroke (1624), Queen's (1340), St. Edmund Hall (1270), St. John's (1555), Trinity (1554), Wadham (1612), Worcester (1714), St. Peter's Hall (1929), St. Antony's College (1950), St. Catherine's Society (1868), Campion Hall, St. Benet's Hall, Mansfield College (1886), Regents' Park College, Greyfriars, and Nuffield College (1937). The women's colleges are:—Lady Margaret Hall (1878), Somerville (1879), St. Hugh's (1886), St. Hilda's (1893), St. Anne's (1952).

Oxygen is the most abundant of all elements. In combination, this gaseous element forms about 46% of the earth's crust; one-fifth of the atmosphere, eight-ninths by weight of all water. Joseph Priestley in 1774 was the first to separate it from red oxide of mercury. It is colourless, tasteless, and odourless, and forms the chief life-supporting element of animal and vegetable life.

"**Oyer and Terminer,**" a legal term designating a commission directed to the judges of the Supreme Courts, empowering them to hear and determine charges of treasons, felonies, and misdemeanours in the counties to which they are proceeding. Courts of Assize are known as Courts of Oyer and Terminer.

Oyez! a phrase used by the ushers of Courts of Justice to proclaim silence. It is the Norman-French word "Oyez" ("Hear ye.").

Oyster, a bivalve mollusc, of the genus Ostrea, having very numerous species and abounding in nearly all seas. The shell is rough and irregular. Oysters are exceedingly prolific, spawning in May and June. In England and Scotland deep-sea oysters are not allowed to be sold between June 15 and Aug. 4, and other kinds between May 14 and Aug. 4. In Ireland, no oysters may be taken between May 1 and Sept. 1, except in certain waters. The Whitstable oyster beds have existed since pre-Roman times; "clocks" are dead oysters.

Oystercatcher, a wading bird with black-and-white plumage and long, orange bill, inhabiting estuaries and sea-shores. Feeds on mussels, shell fish, etc., but not oysters.

Ozone, a modified form of oxygen, containing three atoms of oxygen per molecule instead of two. It is prepared by passing oxygen through a silent electric discharge. When present in air to the extent of 1 part in 4 million parts of air it kills bacteria, and has been used for this purpose in ventilating systems, *e.g.*, that of underground railways. It is present in extremely small quantities in the lower atmosphere but is comparatively plentiful at heights of about 20 miles. The belief widely held that seaside air is particularly rich in ozone is untrue. As ozone absorbs ultra-violet light of certain wavelengths spectroscopic methods, involving the analysis of sunlight, are chiefly used in ozone determinations. *See also* **F46** (1).

P

Paca, a genus of large rodents found in Central and South America, and resembling the guinea-pig. It is of nocturnal habits, has a streaked and spotted fur, and lives on fruits and plants.

Pacific Ocean. The first European to recognise the Pacific as distinct from the Atlantic was the Spanish explorer, Vasco Nuñez de Balboa, who discovered its eastern shore from a peak in Panama in 1513. The first European to sail upon it was Magellan, who entered it by the strait that bears his name in 1520. Sir Francis Drake was the first Englishman to sail upon it in 1577. The world's greatest ocean depth is in the Pacific in the Marianas Trench.

Pæan, the song of praise or triumph sung by the Greeks on the occasion of great celebrations.

Pæon, a foot, in ancient prosody, consisting of one long syllable and three short, the positions of the long syllable being variable.

Pagan, a person who does not worship God; a heathen. The word is derived from the Latin *paganus* (a countryman or uncultivated person). In the Middle Ages the term was used largely to describe Mohammedans (Moors, Saracens, etc.).

Pagoda, the name given in China, India, and other Asiatic countries to a high pyramidal tower, usually, but not necessarily, connected with a temple.

Palæontology, the science which is devoted to the investigation of fossils: animal (palæozoology) and plants (palæobotany). By studying the markings and fossils of living things in the stratified rocks, palæontologists have been able to establish with astonishing accuracy a record of the evolution of life through geological time. The geologist at the same time with the evidence of the fossils has been able to work out the order and the age of the rocks. *See also* **F18–20**.

Palæotherium, a genus of extinct tapir-like animals of large size, discovered in the Paris basin and elsewhere, of the Upper Eocene Age.

Palatinate, a term formerly applied to two German electorates or provinces, the Upper and Lower Palatinates. They are now provinces of Bavaria.

Pale, the name given to the part of Ireland colonised by the English and comprising portions of the counties of Louth, Dublin, Meath, and Kildare. The Anglo-Saxon rulers were styled "Lords of the Pale."

Palimpsests are ancient MSS. or parchments which

have been partly effaced and used for fresh writings. Many valuable MSS. were thus lost, but sometimes the second writing has been washed out, enabling the original writings to be deciphered. Among such restorations are a dialogue of Cicero's, a portion of a book of Livy, etc.

Pallium, a vestmental ornamentation of white wool presented by the Pope to archbishops on their appointment, and the sign of Papal confirmation.

Palm, a large straight-trunked plant or tree common to tropical countries, and usually fruit-yielding, such as dates, coconuts, etc. Many commodities useful to man are obtained from plants of the Palm family (*Palmaceæ*).

Palm Sunday, the Sunday before Easter, upon which occasion it is customary to carry palms to the churches in some countries, in commemoration of Christ's entry into Jerusalem for the Feast of the Passover, when the people went forth to greet Him with palm branches.

Palolo Worm, a marine worm which swarms in huge numbers at certain fixed times of the year off Samoa and neighbouring islands, where the natives collect it in nets and use it as food.

Panama Canal. In 1904 the United States signed a treaty with Panama (which had previously seceded from Colombia) by which rights of sovereignty over a strip of land ten miles in width, extending across the isthmus, were ceded to the U.S. The canal connects the Atlantic and Pacific Oceans, is just over fifty miles long (with sea approaches), and the width of channel varies from 300 to 1,000 ft. at bottom. Transit from sea to sea occupies about eight hours. The depth varies from 41 to 85 ft. It is constructed above sea-level, with locks. It has been available for commercial shipping since Aug. 3, 1914.

Panda, *or* **Cat-Bear,** is related to the Raccoon and to the Bear. There are two kinds, the Red or True Panda, resembling a large domestic cat, which lives in the eastern Himalayas and S.W. China, and the Giant Panda, which is more like a bear in appearance and inhabits the mountains of western China. Both frequent the dense bamboo forests of these regions.

Pandean Pipes, supposed to have been invented or played upon by the god Pan, consist of seven reeds tuned to scale and blown into by breath from the lips of the performer.

Pandex *or* **Pandects,** a summary of the Roman civil law, prepared by order of the Emperor Justinian in the 6th century A.D. (530–33).

Pangolin, the scientific name of the "scaly anteater," a member of the armadillo family, found in Africa and Southern Asia. It has an extensive tongue, covered with glutinous matter, which it uses in catching ants, its chief food. When once caught on the tongue, the insects cannot escape. When attacked the pangolin rolls itself into a ball, and its scales assume the form of sharp spikes.

Pantagruel, the leading character in one of the satires of Rabelais. *See* **G44** (1).

Pantheon, the famous temple in Rome, originally consecrated to the gods, built by Agrippa in 27 B.C. and rebuilt in the 2nd century by Hadrian. Its splendid dome and portico make it one of the most interesting architectural monuments of ancient days. Since the 7th century it has been used as a Christian church. The Panthéon at Paris, built in 1764, is modelled upon it. *See* **G25** (2).

Panther, a large carnivorous quadruped, akin to the leopard, native to India and other parts of Asia, and found also in Africa.

Pantomimes were originally stage representations in which speech was not permitted, all the action being carried on by gesture and movement. The ancient Greeks and Romans favoured them. Later on pantomime became popular throughout Europe, and in the 18th century, with the harlequinade, was adopted as a form of theatrical Christmas entertainment in England. The most famous English pantomime clown of the early 19th century was Joseph Grimaldi.

Papal Infallibility, a dogma which was finally promulgated by the Twentieth General Council in 1870. It states that the Pope, speaking *ex cathedra*, possesses infallibility for decisions on doctrines affecting faith or morals, in virtue of his supreme apostolic power. The strongest opposition to the doctrine existed among the followers of Döllinger in Germany.

Paper has been known in one form or another from very early times. The papyrus reeds of the Nile swamps served the ancient Egyptians for sheets upon which to inscribe their records. The Chinese and Japanese, centuries later, were using something more akin to modern paper in substance, an Asiatic paper-mulberry, yielding a smooth fibrous material, being utilised. With the spread of learning in Western Europe the necessity of a readier medium made itself felt and paper began to be manufactured from pulped rags and other substances. The first known English paper-mill was Sele mill near Stevenage, built about 1490, which produced the paper for an edition of Chaucer in 1498. Other mills were set up under Elizabeth, using linen and cotton as raw material. Other papermaking staples were later introduced, such as surat, esparto grass, and wood-pulp. The chief raw material in the world paper industry is wood-pulp, the main exporters being the timber-growing countries of Canada, Sweden, and Finland. Canada is the world's chief producer of newsprint and supplies a large proportion of U.S. requirements.

Papier mâché means pulped-paper and is a composition of paper pulp and other substances, to which, when moulded into form, coatings of japan, with gilt and coloured inlayings, are added. Elegant and decorative objects are made of papier-mâché. A ceramic papier-mâché is very durable.

Papyrus, the earliest known paper made in Egypt at a very remote period from a large species of reed, *Cyperus papyrus*. This plant is to be found all over tropical Africa, especially in the "sudd" region of the White Nile.

Parachute, the umbrella-shaped safety device used in emergency by the crew and passengers of aircraft. The first parachute descent was made in 1797 by André Garnerin from a balloon. In 1947 three Russian parachutists beat the international record by jumping from the stratosphere at a height of over 8 miles.

Paraclete (the Holy Ghost, or Comforter), the name used in the English translations of St. John's Gospel, and adopted by Abelard to designate the convent in Champagne founded by him, and of which Héloïse became the abbess.

Paradise, a Persian word used by the translators of the Old Testament to designate the Garden of Eden, and since meaning any place of happiness.

Paraffin was first obtained by distillation of coal, the process being discovered about 1830. About 1848, Mr. James Young procured it from mineral oil, and Irish peat also yielded it. The main source of paraffin supply to-day is crude petroleum. It is largely used in the manufacture of candles, for waterproofing, and numerous other purposes.

Parakeets, various small parrots of vivid plumage native to Australia, Polynesia, Asia, and Africa. One of the loveliest of the parakeets is the budgerigar of Australia. *See* **Z21, 23.**

Parcel Post was established in England in 1883 for inland parcels up to 7 lb. in weight, the maximum being raised to 15 lb. in 1935. The system has since been extended to practically all countries of the world. The British Postal authorities carry about 250 million parcels annually.

Parchment, made chiefly from the skins of animals, usually of goats and sheep, was employed in olden times before printing was invented and superseded papyrus as writing material. Vegetable parchment, invented by W. E. Gaine in 1853, though not equal in strength and durability to skin parchment, is about five times stronger than ordinary paper. Vellum is parchment made from the skins of young calves or lambs.

Parhelia is the term applied to the very peculiar phenomena known as "mock-suns" seen sometimes in the higher Arctic regions. The sun is then attended by a number of halos crossing each other in various geometrical forms, and said to be due to the refraction of light caused by ice crystals in the upper air.

Pariah, a word meaning "social outcast" from the word *Paraiyan*, a very low caste of Hindu,

outside the pale of regular castes, and avoided as something unclean.

Paris University, also known as the Sorbonne, was founded in 1256 and is one of the greatest educational institutions of Europe.

Parliament, is the name given to the supreme legislature of the United Kingdom. It consists of the Queen, the Lords spiritual and temporal, and the Commons. It meets in two houses: the House of Lords (the Upper or Second Chamber) and the House of Commons. It derives from the Anglo-Saxon *Witans* (*see* **Witan**). The Statute of Westminster (1275) first uses "parlement" of the Great Council in England, which comes from the French word meaning discourse. *See* **C7–11, D5.**

Parliamentary Correspondents sit in the Press Gallery of the House of Commons and describe its proceedings for newspapers either by impressions or a summary of the debate.

Parquetry, the name of a style of flooring consisting of small rectangular wooden blocks laid down according to geometrical pattern.

Parrot, the popular name of a widely distributed family of tropical birds, including the African grey parrot, the green parrot of South America—both familiar cage pets in this country—and the various parakeets, cockatoos, macaws, lories, etc. Many of these birds possess a remarkable gift of imitating sound, especially that of the human voice.

Parsec, unit of distance used by astronomers for expressing distances between stars. It is equivalent to about three and a quarter light-years.

Parsees, descendants of the Zoroastrians, or Fire-worshippers of Persia, are now more numerous in India than in the land of the Shah. They are born traders, and many of them not only possess great wealth but are renowned for their charities.

Parthenogenesis. The development of animals from unfertilised eggs. The drones of the honey bee are parthenogenetic, and the phenomenon is also common among aphids.

Parthenon, the famous Temple of Athena on the Acropolis at Athens, was built under the rule of Pericles between 447 B.C. and 432 B.C. (*See* **Greek Art, Section G.**) The famous sculptured friezes, known as the Elgin Marbles, are now in the British Museum.

Partridge, a well-known British game bird the shooting of which forms a considerable attraction to sportsmen in the season, which opens on Sept. 1. Two species are common in Britain.

Passover, the Jewish festival commemorating the departure from Egypt and the passing of the Angel of Death over the houses of the Israelites.

Passport is an official document issued to a person by his own government, certifying to his citizenship and permitting him to travel abroad. Passports to British subjects are granted by the Foreign Office, authorise bearer to leave the country and guarantee him the state's protection. Valid for 5 years.

Paten, the dish used for holding the consecrated bread in the Eucharistic service.

Patricians, the aristocracy of ancient Rome.

Paul's Cathedral, St., is the third cathedral church to be built on the site. It was preceded by a Norman building which was practically destroyed by the Great Fire in 1666. This followed a Saxon church which was burnt in 1086. The present building was designed by Sir Christopher Wren. The foundation stone was laid in 1675 and the structure was completed in 1710. It cost a little under £748,000. Its central feature is the dome, crowned by its cupola and lantern with the golden ball and cross. It escaped serious damage during the air raids of the second world war, but many of the surrounding buildings were laid waste.

***pC* Value**, introduced by Dr. C. L. Whittles in 1935 as a measure of salinity of aqueous solutions (soil extract, irrigation water, etc.); defined as the negative logarithm of specific electrical conductivity in reciprocal ohms. Alone or joined with *pH* (below) is useful as an index of osmotic pressure (*see* **Osmosis**) and related hindrance to plant growth resulting from excess of fertiliser or soil salts. If manuring is balanced, growth is best about *pC* 3.3.

Peacock, a bird of large size and beautiful plumage, its characteristic feature being a tail of brilliant "eyed" feathers, which it has the power of erecting and spreading out, the males possessing resplendent feathering to a much greater extent than the females. It is related to the pheasant; one species is found wild in the forests of India, and another inhabits Burma and the Malayan regions.

Pean, a term in heraldry indicating one of the furs borne in coat armour, the ground of which is black, with ermine spots of gold.

Peanut, Ground Nut *or* **Monkey Nut.** A member of the pea family native to S. America, but now cultivated in many parts of the world. After pollination, the flower stalk bends down and buries the pod containing the peas ("nuts") in the ground. The oil from these "nuts" can be used for margarine manufacture.

Pearl is produced by certain shelled molluscs, chiefly the oyster. The inner surface of the shells of the pearl oyster yield "mother-of-pearl," and distinct pearls are believed to be morbid secretions, caused by some external irritation. Many fine pearls are found in the actual body of the oyster. The Persian Gulf, Ceylon, the north-west coast of Western Australia, many Pacific islands, and the Gulf of Mexico are among the most productive pearl-fishing grounds. In ancient times Britain was renowned for its pearl fisheries, the pearls being obtained from a species of fresh-water mussel. Western Australia has produced a 40-grain pearl, the finest the world has seen. The largest pearl ever found was the "Beresford-Hope Pearl," which weighed 1,800 grains, over six times as much as the oyster that produced it.

Peat, decayed vegetable matter found mostly in marshy positions, and common in Ireland and Scotland. Peat is coal in its first stage of development. It is burnt for fuel in many cottage homes.

Peccary, a pig-like animal native to the Americas. There are two species: the collared peccary and the white-lipped peccary, the latter being a vicious and dangerous animal.

Peel Tower, the name applied to the numerous fortified towers or strongholds which are to be found along the Scottish Border.

Peep o' Day Boys, the Irish Protestant insurgents of 1784–95, so-called because they visited the houses of their antagonists at daybreak in search of arms.

Pelagians were a heretical Christian sect of the 5th century, founded by Pelagius, a Briton, who settled in Rome *c.* 400. A bitter controversy was aroused over the Pelagian doctrine, which denied the idea of original sin and laid emphasis on human responsibility for doing good or evil. Pelagianism was condemned by the councils of Jerusalem and Carthage as heresy.

Pelasgians, legendary peoples of ancient Greece who were the first to invade the mainland; settled in northern Greece and moved southward. Most prosperous in the 13th and 12th centuries B.C.

Pelican, a genus of bird with long depressed bills pouched underneath so that the bird can hold a number of fish in reserve for future consumption. They have immense wings and webbed feet.

Pemmican, vension or other meat, sliced, dried, pounded and made into cakes, used by explorers and others when out of reach of fresh meat.

Penguin, a genus of flightless, fish-eating sea-birds of the southern hemisphere. They are stout-bodied, short-necked, and of small, moderate, or large size. The Emperor and King Penguins make no nest but protect and incubate the single egg by carrying it in the down feathers between the feet and the body. Other species brood in the usual way and may lay as many as three eggs. Penguins use their flippers for swimming under water. All 17 species are bluish-grey or blackish above and white below. They are very sociable and breed in colonies.

Penicillin. An antibiotic drug produced by the mould *Penicillium notatum*, and discovered by Sir Alexander Fleming in 1928. It has been described as the most effective chemotherapeutic agent known. *See* **P4** (2), **9** (1).

Peninsular War lasted from 1808 to 1814. Fought in Spain and Portugal (the Iberian peninsula) by the British, Spanish, and Portuguese forces,

chiefly under Wellington, against the French. The latter were defeated.

Pentagon, government office in Washington (the largest in the world), housing many thousands of military and civilian workers in the War Department of the United States (Army, Navy, and Air Force).

Pentateuch, the first five books of the Old Testament—Genesis, Exodus, Leviticus, Numbers, and Deuteronomy.

Pentatonic Scale, the scale of five notes prevalent in Chinese, Japanese, Javanese, and some Negro music. Music based on the pentatonic scale is almost imcomprehensible to an ear accustomed to the diatonic scale.

Pentecost, in the Christian Church, the Whitsuntide festival in commemoration of the descent of the Holy Ghost upon the apostles during the feast of the Pentecost; to the Jews it is a time of solemn celebration—"the feast of weeks," celebrated on the 50th day, or seven weeks, after the Passover.

"Pepys Diary," by Samuel Pepys, was first published in 1825. The original MS. is deposited at Magdalene College, Cambridge. The "Diary" gives a picture of the social life of the period between Jan. 1, 1660, and May 31, 1669.

Perch, a well-known family of sea and fresh-water fish, with dark striped sides. The common perch of British rivers and lakes falls an easy prey to the angler because of its voracity.

Percussion Instruments, a collective term covering the instruments of an orchestra that give forth sound when struck, *e.g.*, timpani, drums, cymbals, tambourine, triangle, glockenspiel. In some modern orchestral works the pianoforte is used as a percussion instrument instead of in its usual role as a solo instrument.

Perfumes are essences or odours obtained from floral and other substances. The chief flower perfumes are those obtained from rose, jasmine, orange flower, violet, and acacia. Heliotrope perfume is largely obtained from vanilla and almonds. Among the aromatic herbs which yield attractive perfumes are the rosemary, thyme, geranium, lavender, etc., while orange peel, citron peel, musk, sandalwood, patchouli, and other vegetable products are largely drawn upon. In recent times chemistry has been called into play in aid of the perfumer, and many of the popular perfumes of to-day are chemically prepared in simulation of the scents of the flowers or other natural substances the names of which they bear.

Periclase, a mineral form of magnesium oxide.

Perigee. The moon or the sun is said to be in perigee when it is at its least distance from the earth. The opposite of apogee (which see).

Perihelion. That point in a planet's orbit when it is nearest to the sun. The opposite of aphelion.

Peripatetics were followers of Aristotle, the name arising from the philosopher's habit of walking up and down while he expounded his theories.

Peripatus, an animal which stands as a link between the annelid worms and the arthropods. In appearance it resembles a caterpillar, and it respires by a system of air tubes like those in insects. Certain other points of internal structure point to a relationship with annelid worms. There are some fifty species, the best known being the S. African *Peripalus capensis*.

Periscope, an optical instrument which enables the user to observe objects on the other side of an obstacle without exposing himself.

Periwig. (*See* **Peruke.**)

Perjury, the offence of giving false evidence. The ancient Romans threw the perjurer from the Tarpeian Rock, and after the Empire was Christianised, those who swore falsely upon the Gospel had their tongues cut out. The usual punishment in England from the 16th to the 19th centuries was the pillory, fine, and imprisonment.

Permian Formation, a group of rocks lying between the Trias and the Carboniferous strata. It has three subdivisions, Upper, Middle and Lower Permian, all of which are rich in fossil deposits.

Per Procurationem signature means that the subject of the correspondence has been put into the writer's care by his principal for him to use his personal judgment in the matter, and that he is authorised to sign on behalf of his principal. Normally contracted to *per pro* or *p.p.*

Perseids, meteor showers which are to be seen every August. The first recorded observation of the Perseids dates back to A.D. 830.

Peruke, the name given to the wigs worn by men in the latter half of the 18th century. The custom of wearing wigs was gradually superseded by powdering the natural hair. Wigs are still worn by the Speaker of the House of Commons, judges, and barristers.

Peterloo Massacre, a result of a conflict between the military and a large concourse of people assembled at a Parliamentary Reform meeting held on Aug. 16, 1819, on St. Peter's Field, Manchester, involving the loss of many lives.

Peter's Pence, the tax levied in England by the Pope from the 8th or 9th century, and subsequently extended to other countries. It amounted to a silver penny per hearth. It was withheld by England in 1366 in order to bring pressure to bear on the Pope to agree to the statute of præmunire, and was abolished by Henry VIII. in 1534, though it has since been revived as a voluntary contribution by Roman Catholics.

Peter's, St., at Rome, as it at present exists, was built in the 16th and 17th centuries, the first stone being laid by Pope Julius II. in 1506. It was not completed until 1660. The dome was designed by Michelangelo, and Raphael was employed for a time in decorating the building. It is the chief church of Roman Catholic Christendom and in it the Popes are crowned.

Petition of Right, passed in 1628, defined unparliamentary taxation, billeting, arbitrary imprisonment, and martial law over civilians as illegal. It was conceded by Charles I. to his Parliament in return for a vote of five subsidies.

Petrel, the name given to a member of a large, widely-distributed family of sea-birds of great diversity of size and colouring and distinguished by tube-like external nostrils. They usually skim low over the waves, and some, for this reason, are known as shearwaters. The storm petrel or Mother Carey's chicken occasionally patters along the surface, and is often called Little Peter—a reference to St. Peter walking on the water. Except when breeding, petrels are always at sea. They mostly nest in holes and crevices on islands and lay one egg, which is invariably white. The storm petrel, Leach's petrel, Manx shearwater, and the fulmar petrel are resident in the British Isles. (*See also* **Mutton Bird.**)

Petroleum, a mineral oil composed of a very complex mixture of hydrocarbons, occurring naturally in the earth and recovered by pumping or drilling under great pressure. The composition of the crude oil varies according to source and may be divided roughly into two types: paraffinous and naphthenic. The crude oil is subjected to fractional distillation which separates out the various grades of petroleum with their different boiling points. "Cracking" converts, by heating under pressure, oils of high boiling point into more volatile oils suitable for petrol engines. A great industry has grown up around petroleum, and the by-products, which used to be regarded as waste, form the basis of the modern synthetic-chemical industry (rubber, plastics, etc.). Chief sources are: U.S.A., Middle East, Caribbean, U.S.S.R., and Eastern Europe. The oil is carried in pipelines sometimes for hundreds of miles from oilfield to port.

Pewter, alloy of tin and lead formerly much used for making household utensils and ornaments.

***pH* Value.** Introduced in 1909 by the Danish chemist Sørensen to indicate hydrogen-ion concentration on the basis of electrical conductivity and a view of ionisation since discarded; is now taken as a logarithmic scale of acidity or alkalinity of aqueous solutions: acidity 0–7, neutrality at 7·0, alkalinity 7–14. The *pH* of blood is about 7·6 (faintly alkaline).

Phalanger, pouched marsupial mammals. They are arboreal and superficially resemble squirrels. There are two genera of flying phalangers or flying squirrels, which have a remarkable membrane along each side of the body enabling the animals to glide through the air. The members of the phalanger family are confined to the Australasian and oriental regions.

Phalangid, a member of the arachnid order Phalangida: popularly known as "harvesters."

Phalanx, a name applied by the ancient Greeks to a body of troops drawn up in close array, with overlapping shields, and eight, ten, or more rows deep. The Macedonians stood sixteen deep. A Greek phalanx consisted of 8,000 men.

Pharmacopœia, an official publication containing information on the recognised drugs used in medicine. Each country has its own pharmacopœia. The British Pharmacopœia (B.P.) is published under the direction of the General Medical Council. The Pharmaceutical Society issues the British Pharmaceutical Codex (B.P.C.); there is also an International Pharmacopœia (2 vols.) which is issued by the World Health Organisation.

Pharos, the name of the first lighthouse, built by Ptolemy II. about 260 B.C., on the Isle of Pharos, at the entrance to the harbour of Alexandria. It was about 460 ft. high, and one of the "seven wonders."

Pheasant, game birds allied to the partridges, quails, peacocks and turkeys, distinguished by their brilliant plumage and long tapering tail. First found by the Greeks in Georgia where the River Phasis flows through to the Black Sea.

Philippics, the orations delivered by Demosthenes, 352–341 B.C., against Philip of Macedon—remarkable for their acrimonious invective. The word was also used for Cicero's speeches against Antony. In modern use, any impassioned invective.

Philosopher's Stone. (*See* **Alchemy.**)

Philosophy is concerned primarily with the nature of reality (metaphysics) and seeks to determine also the nature of human knowledge with its limitations. It has been described as a sort of "clearing house" of mankind's experience, assessing and evaluating its meaning and significance while examining the beliefs derived therefrom. Enquiry into the nature of "good" and "right"—for the individual (ethics) and for the community (political philosophy)—as well as the nature of beauty (æsthetics) are other branches of the subject. Philosophy has been likened by the great contemporary philosopher, Bertrand Russell, to a No-Man's Land—"something intermediate between theology and science"—since it is concerned with speculations on questions which neither science nor dogma can convincingly answer.

Phœnix, a fabled bird of Egyptian mythology.

Phœnix Park, the great public park of Dublin, 1,800 acres in extent and containing the Vice-Regal Lodge. It was in this park that Lord Frederick Cavendish, Secretary for Ireland, and Under-Secretary Thomas Burke were assassinated in 1882.

Phosphorus was discovered by Brandt in urine in 1669. It is found in most animal and vegetable tissues. It is an essential element of all plants and of the bones of animals. In combination with various metals it forms different phosphates, which are largely utilised as manures. The chief commercial use of phosphorus is in the preparation of matches.

Photogrammetry, the science of measurement from photographs taken from an aircraft. Aerial photography has many uses and is of great value to military intelligence and for map-making.

Photometer, an instrument, of which there are various forms, for measuring the intensity of light.

Photomicrography, the taking of photographs through a microscope.

Photosynthesis is the process by which plants build up food by means of light. The carbon dioxide and water absorbed by plants are converted by photosynthesis into complex food substances, such as sugar and starch, by the green colouring matter *chlorophyll*, helped by the radiant energy of the sun. *See* **F30.**

Phylloxera, a kind of plant lice related to aphids, which attack the grape vine, and in some years cause great devastation in the vineyards. *See* **S39** (2).

Physicians, Royal College of, was constituted in London in 1518, Dr. Linacre, physician to Henry VIII., and the projector of the College, being its first president. The present College in Trafalgar Square was erected about 1825 from designs by Sir R. Smirke.

Piano-Accordion, a small, portable reed-organ whose melody is played by the right hand on a short piano-type keyboard. The left hand operates up to 120 stud-like bass keys, each of which produces a standard chord. The instrument is slung from a strap across the shoulders and wind for the reeds is provided by a central bellows operated by the movement of the left arm. The piano-accordion is an Italian development of the older accordion or concertina.

Pianoforte. Fundamentally a mechanical dulcimer whose hammers are operated from a keyboard, just as the harpsichord is a mechanical harp whose strings are plucked by quills operated from a keyboard. Historically, however, the pianoforte followed the harpsichord, on which it was regarded as an improvement. The name itself (piano-forte = soft-loud) was chosen to point out that the new instrument gave a much wider control of volume than did the harpsichord. The pianoforte first appeared in the 18th century and its invention is generally attributed to an Italian, Cristofori, who produced an instrument called the "piano e forte" in 1711. England first saw the pianoforte in the 1760's. The pianoforte soon came to be recognised as the ideal instrument for the amateur musician—a fact which nearly led to its undoing. First there arose the atrocious "cabinet-piano" in which an inferior pianoforte movement was incorporated in a piece of furniture designed to fulfil some other purpose. Later, in Victorian times, when no middle-class home was complete without a "piano," the market became flooded with cheap and nasty instruments in whose design size and price were the only considerations. Fortunately, however, the great composers of the 18th and 19th centuries realised the possibilities of the pianoforte and wrote pieces for it that taxed the powers of both performer and instrument. This put a constant pressure upon pianoforte manufacturers to improve their instruments so that these difficult pieces could be played by less expert musicians. The modern pianoforte appears in two main forms: the "grand" in which the frame bearing the strings is horizontal, and the "upright" in which the frame is vertical. The frame is a very heavy iron casting capable of withstanding a string tension of many tons. In older wooden-framed pianos the string tension is lower and the tone consequently less brilliant. The "check action" in which the hammers pivot freely has superseded the "sticker action" in which the hammer is pushed forward by a system of levers. Most pianos are provided with two pedals. The "soft" pedal should move the hammers a little to one side so that they strike only one string instead of two or three, but it may work by shortening the travel of the hammers or, in cheap actions, by the application of a light damper to the strings. The "loud" or sustaining pedal removes the main dampers so that a note continues to sound after the key has been released. Probably the most famous makers of pianofortes are Pleyel (France) and Blüthner and Bechstein (Germany). Good English pianos have been made by Broadwood, Collard, etc. *See also* **G51** (2).

Pibroch, a type of Scottish bagpipe music consisting of variations on an air.

Piccolo, a small flute with a high, piercing note. When required, the piccolo is usually played by one of the flautists in an orchestra.

Picts, inhabitants of Scotland in pre-Roman times, are held by some historians to be a branch of the old Celtic race, by others to have been of Scythian origin. They occupied the Lowland portion of Scotland, and were subdued by the Scots in the 9th century, Kenneth II. becoming king of the whole of Scotland.

Pike, a familiar fresh-water fish abundant in the temperate regions of both hemispheres. It forms good sport for the angler in rivers and lakes, and sometimes attains a weight of from 20 to 30 lb. It is extremely voracious, is covered with small scales, and has a ferocious-looking head

Pilchard, a fish of the herring family, but with

smaller scales and more rounded body. It appears off the Cornish coasts in vast shoals every summer.

Pilgrimage, the undertaking of a journey to a distant place or shrine to satisfy a religious vow or secure spiritual benefit, was resorted to in early Christian times The first recorded pilgrimage is that of the Empress Helena to Jerusalem in 326. In the Middle Ages pilgrimages became common, and were undertaken by monarchs and people of rank in all Christian countries. The Mohammedans have been making pilgrimages to Mecca since the death of the Prophet, such duty being enjoined by the Koran. Among the great centres of Christian pilgrimages are Jerusalem, Rome, the tomb of Becket at Canterbury, and the holy places of Lourdes and La Salette in France.

Pilgrim Fathers, the 101 English Puritans, who, after living some years in exile in Holland, to escape persecution in their own country, set sail for America in the *Mayflower* Sept. 6 1620, landing at Plymouth, Mass., Dec. 4. They founded the settlement of Plymouth, and are regarded as the pioneers of American colonisation although 13 years earlier a small Virginian colony had been established.

"Pilgrim's Progress," Bunyan's famous allegory, written in Bedford gaol. The first part was issued in 1678. It is the greatest work of its kind. *See also* **G49** (1).

Pilgrim Trust, The, was established in 1930 through the generosity of an American, the late E. S. Harkness, who "had many ties of affection with the land (England) from which he draws his descent." A sum, approximately £2 million, was placed in the hands of trustees for distribution in Great Britain. The terms of the deed are sufficiently wide to cover charitable, educational, and national institutions, and the disbursements are made at the discretion of the trustees. This generous benefaction is due to the donor's admiration of the part Great Britain played in the first world war, and the financial burden she has since sustained.

Pillory, a wooden instrument of punishment in use in England until 1837. It consisted of a pair of movable boards with holes through which the culprit's head and hands were put, and was usually erected on a scaffold. While a person was undergoing this punishment the mob generally pelted him with stones and rubbish, sometimes to his serious injury. People convicted of forgery, perjury, or libel were often condemned to the pillory, but from 1816 to 1837 the only offence for which it could be inflicted was perjury.

Pine, a conifer of the genus *Pinus*, which flourishes all over the northern hemisphere and includes 80–90 species, which afford valuable timber and yield turpentine and tar. The Scots Pine, *Pinus silvestris*, with its blue-green, short needles, set in pairs, and its rosy-orange branches, is native to Britain, as it is to the whole of Europe. It provides the red and yellow deal in everyday use.

Pipa, a species of toad inhabiting Guiana, and not found elsewhere. It is of considerable size, and is remarkable for the fact that the female carries its eggs on its back until they are hatched, herself depositing them in that position. Generally known as the "Surinam toad."

Pitcairn Islanders were originally the mutineers of the *Bounty*. They took possession of the island in 1790, and it was not until 1814 that their whereabouts was ascertained, accidentally, by a passing ship. The mutineers, under their leader, Adams, had settled down to a communal existence, married Tahitian women, and increased so in numbers that in the course of years they were too many for the island to support, and in 1856 they were removed by the British Government to Norfolk Island. A small number returned to Pitcairn.

Pitchblende *or* **Uraninite**, a relatively scarce mineral. It is nearly all uranium oxide, but lead, thorium, etc., are also present. Pitchblende from Joachimstal in Czechoslovakia was the material in which radium was discovered by the Curies. Pitchblende also occurs in Saxony, Rumania, Norway, Cornwall, the Belgian Congo, and at Great Bear Lake in Canada.

Plague, a fatal epidemic which spread over Europe and devastated England at different periods between the 10th and the 19th centuries. In the 14th century the devastating outbreak known as the Black Death swept over Europe. The Great Plague of London occurred from 1664–65.

Plaice, a familiar British sea-fish, of the flounder family, characterised by the red spots on the upper surface.

Plaid, a comprehensive garment of tartan or woollen material checked and coloured in distinctive markings for different Scottish clans and worn by women as well as men.

Plainsong, a style of musical composition sung in unison (all voices singing the same tune without harmony), familiar in the Western Church from very early times and still performed, principally in the Roman Catholic Church. Though restrained and contemplative in spirit, it is capable of expressing deep emotion.

Planets, the name give to such celestial bodies as revolve round the sun in elliptical orbits. The name was first used by the Greeks to indicate their difference from the fixed stars. There are nine planets, Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Uranus, Neptune, and Pluto. *See* **F7**.

Plankton, a word which first came into biological use in 1886 to describe the usually microscopic plants and animals floating, swimming, and drifting in the surface waters of the sea. To be distinguished from *nekton* (swimming animals like fishes and squids) and *benthos* (plants and animals living on the sea bottom, like fixed algæ, sponges, oysters, crabs, etc.).

Plantagenets, the kings who reigned in England between 1154 and 1485 and included the Houses of Lancaster and York. More correctly they are styled Angevins, from Anjou, of which Geoffrey, father of Henry II., was Count, and whose badge was a sprig of broom (*planta genista*).

Plassey, Battle of, was fought between the British under Clive and the Indians under Suraj-ud-Daula on June 23, 1757. The British gained a decisive victory over much larger forces.

Plastics, a broad term covering those substances which become plastic when subjected to increased temperatures or pressures. The Plastics Industry is based on synthetic organic examples of this group. There are two classes of plastics: the *thermoplastic*, which become plastic every time they are heated (*e.g.* cellulosic plastics) and *thermosetting*, which undergo chemical change when heated, so that once set they cannot be rendered plastic again (*e.g.* Bakelite).

Plate, the term applied to gold, silver, or plated-ware, such as spoons, knives, forks, dishes, cups etc. (*See* **Goldsmiths Company.**) In recent times it has been the custom to include under the term articles of the baser metals covered with a thin coating of silver and differentiated as "electro-plate."

Platinum, a scarce white metal generally allied with iridium, osmium, ruthenium, and palladium. It can only be melted in an oxyhydrogen or electric furnace, but can be rolled out into a film-like sheet, or drawn out to the finest wire.

Platyhelminthes *or* **Flat-worms**, the phylum of the animal kingdom to which the parasitic flukes and tapeworms and the free-living planarians belong.

Plebeians were the ordinary citizens of Rome as distinct from the patricians. There was a long struggle between the two orders for political equality.

Pleiades, famous cluster of stars in the constellation of Taurus. Of the seven principal stars in the group, one is rather faint, and many myths have sprung up about this "lost pleiad" as it is called.

Pleistocene the geological period that succeeded the Pliocene. It is supposed to have begun more than half a million years ago. During the Pleistocene, also known as the *Great Ice Age*, there were four cold periods, when the ice sheets covered northern Europe and N. America, separated by warm periods when the glaciers drew back into the mountains. *See* **F20**.

Pliocene, the geological period preceding the Pleistocene, and the last major division of the Tertiary strata. It began about fifteen million years ago.

Plough Monday, the first Monday after the Epiphany, when in olden times the rustic population returned to work after the Christmas festivities.

Plover, wading birds, widely distributed over marshy places of Europe. Several species occur in Britain, including the Golden-plover, which breeds on the moors of Devon, Somerset, Wales, N.E. Yorkshire, and is widely distributed over Scotland.

"Plug" Riots were frequent in the manufacturing districts of the North of England about 1842, when there was great distress among factory workers. The rioters attacked mills and, by drawing the plugs from the boilers, stopped the machinery.

Pluto, the last planet to be discovered. Its existence was established by C. W. Tombaugh at the Flagstaff Observatory in Arizona in Jan. 1930 from reckonings made by P. Lowell in 1914. It is the most distant of all the known planets; diameter about 3,650 miles. Its mean distance from the sun is estimated at 3,671 million miles.

Plutonium, a chemical element capable of nuclear fission in the same way as Uranium 235. Not until after it had been synthesised in atomic piles during the second world war was it shown to occur in infinitesimally small traces in nature. Its synthesis in the atomic pile depends on the capture by Uranium 238 nuclei of neutrons; immediate product of this reaction is the element neptunium, but this undergoes rapid radioactive disintegration to plutonium.

Plymouth Brethren, a Nonconformist sect founded about 1830 by J. N. Darby. They are not at great variance with other Protestant Churches, recognise no order of ministers, and receive into communion all who acknowledge Christ.

Poet Laureate is the poet attached to the royal household, an office officially established in 1668, though its origins go back to the early Middle Ages, when minstrels were employed at the courts of English kings. Chaucer, Skelton, and Spenser, though not court poets, were all unofficial poets laureate. Ben Jonson has been described as the first "official laureate," but the office was not officially recognised until 1688, when Dryden was formally granted the office of P.L. It is customary for the Poet Laureate to write verse in celebration of events of national importance. John Masefield succeeded Robert Bridges as P.L. in 1930.

Pogrom. Russian word meaning "destruction." First used to describe the Czarist attacks on the Jews in 1881 in Russia (where they have vanished since the Revolution). In 1938 Hitler ordered a general pogrom in Germany. All synagogues were destroyed and nearly all Jewish shops and homes, Jewish hospitals and children's homes suffered. During the subsequent war Jews of central Europe were systematically exterminated in cold blood by the Nazis.

Poitiers, Battle of, was fought on Sept. 19, 1356, during the Hundred Years' War, when Edward the Black Prince gained a complete victory over John, King of France, who was taken prisoner and brought to London.

Pole-Cat, an animal of a dark-brown colour, about 18 in. in length, exclusive of tail; the ears and face-markings are white or light brown. It is carnivorous and belongs to the weasel family. Like the skunk, it emits an offensive odour.

Pole-Star is of the second magnitude, and the last in the tail of the Little Bear constellation. Being near the North pole of the heavens—never more than about one degree from due north—it always remains visible in the Northern hemisphere; hence its use as a guide to seamen.

Police, a regular force established for the preservation of law and order and the prevention and detection of crime. The powers they have vary from country to country and with the type of government; the more civilised and democratic the state, the less police intervention. England, compared with countries abroad, was slow to develop a police force, and it was not until 1829 that Sir Robert Peel's Metropolitan Police Act established a regular force for the metropolis, later legislation establishing county and borough forces maintained by local police authorities throughout England and Wales. Up to that time police duties were discharged by individual constables and watchmen appointed by local areas in England and Wales. The efficiency of the Police is the concern of the Home Office, and in Scotland of the Scottish Office. *See* C6 (1).

Polka, a dance introduced into England from Bohemia in 1843; it won great popularity, but is now seldom danced.

Poll Tax, a tax levied on every adult—every head or poll—was first imposed in England in 1380, and led to the "Peasants' Revolt," headed by Wat Tyler. It was reimposed at intervals, notably in 1513 and in the reign of Charles II. The poll tax of 1698 was the last of its kind.

Pollution of the atmosphere is due chiefly to the incomplete combustion of fuels, especially coal, large particles of soot being deposited fairly quickly close to their place of origin and smaller particles (including smoke) remaining suspended in the air for a long time. Corrosion of exposed objects and damage to buildings result from the production of sulphuric acid. The introduction of more efficient furnaces and the washing of flue gases have assisted in the abatement of smoke and other forms of pollution. Estimation of polluting substances is carried out systematically in Great Britain by the Department of Scientific and Industrial Research, the dust and matter brought down with the rain being collected in large deposit gauges; automatic filters provide continuous records of the variation of the floating solid impurities; and apparatus is employed to measure the concentration of sulphur dioxide. "**Smog**" (smoke-laden fog), which reduces visibility to zero and affects the respiratory organs, is liable to occur when the air near the earth is cooled below its dew-point temperature by radiation on a still, cloudless night, when an accumulation of smoke over a large city cuts off daylight and produces gloom, and absence of wind or vertical currents prevents the lower layers of the air from getting away. Such conditions are associated with the smoke-laden atmosphere of large industrial towns during a winter anticyclone.

Polonaise *or* **Polacca**, a musical composition in the style of a traditional Polish dance. Chopin is the best-known composer of Polonaises.

Polonium, a radioactive element discovered by Madame Curie in 1898, and named after her native land of Poland.

Polymerisation is the linking together of small molecules to make a large long-chain molecule. The general name for polymers of ethylene is Polythene, a wax-like plastic solid which because of its special qualities is being used in a variety of ways today.

Polytheism, the doctrine of plurality of god-heads.

Pomander, name of a small ball or box containing perfumes and spices, formerly carried suspended from the neck or girdle as a protection against infection so it was believed.

Pomology, the science of fruit-growing.

Poniard, a dagger-like weapon commonly carried about the person by Spaniards and Italians of the 16th and 17th centuries, but never much in vogue in England.

Pontifex, the title assigned in ancient Rome to members of the college of pontifices. "Pontifex maximus" was the official head of Roman religion. It was as "pontifex maximus" that Julius Cæsar revised the calendar in 46 B.C., and when after the rise of Christianity the popes took over the title the revision of the calendar fell to them.

Pontoon, any temporary floating structure that forms part of a bridge across a river. Pontoons are in various forms, mostly cylindrical and hollow, others take the shape of deck-boats locked together. Pontoon bridges capable of supporting railways are a feature of modern military equipment.

Poodle, a well-known variety of domestic dog having a thick curly coat which in France it is the custom to cut close on the lower part of the body. It is an exceptionally intelligent animal, capable of being taught many tricks.

Pope, The, the head of the Roman Catholic Church and successor of St. Peter. He is elected by the body of Cardinals; since 1870 when the King of Italy deposed the holder of the office from temporal power, no Pope had left the

Vatican between appointment and death until 1929, when peace was made between the Church and State in Italy and compensation was paid to the Holy See for the loss of temporal power. Cardinal Roncalli, Patriarch of Venice, was elected Pope John XXIII. in 1958 following the death of Pope Pius XII.

Poplin, a favourite fabric composed of silk and worsted. The industry was introduced into England by Huguenot refugees in 1693.

Poppy Oil, a fixed oil obtained from the seeds of the opium-poppy, and used as a food, for illumination, and in a certain class of soapmaking.

Porcelain. There are three kinds of pottery: earthenware, stoneware, and porcelain; the marks shown in the General Compendium are restricted to those used on porcelain, a word thought to be derived from the Italian *porcelana*, indicating the texture of a piglet. The majority of porcelain made on the continent was of "hard-paste," or true porcelain, similar to that discovered by the Chinese as early as the T'ang Dynasty (A.D. 618–907); it was composed of kaolin (china-clay) and petuntse (china-stone) which when fired at a high temperature formed an extremely hard and translucent material. The recipe of "hard-paste" porcelain remained a secret of the Chinese until 1708, when it was rediscovered in Europe by Johann Böttger of the Meissen factory (popularly known as Dresden). Aided by runaway Meissen workmen factories were soon established at Vienna, Venice and later in many other parts of Germany. During the middle of the 18th century Plymouth and Bristol were the only English factories to make this type of porcelain, elsewhere both in England and France, the material used was known as "soft-paste" or artificial porcelain which was made by blending varying ingredients together with the materials of glass. By the 19th century hard-paste porcelain was used throughout practically the whole of the continent, but in England a hybrid-paste containing bone-ash was introduced and is still the material used to-day.

Porcupine, a rodent whose back is covered with long, sharp, black and white spikes, which form a powerful means of defence. There are two families of porcupines; one is confined to the Old World and the other contains the American porcupines.

Porphyry, a form of crystalline rock of many varieties that in ancient Egypt was quarried and used for the decorative portions of buildings and vessels. The term is applied generally to the eruptive rocks of the porphyritic class.

Porpoise, a marine mammal of the dolphin family, and a common inhabitant of northern seas. Porpoises travel in shoals, their progression being marked by constant leapings and plungings. Their average length is from 4 to 5 ft. There are several species, nearly all being confined to northern oceans.

Port, a special kind of red Portuguese wine, taking its name from Oporto. It was little known in England until the Methuen Treaty of 1703, when it was permitted to be imported at a low duty.

Portcullis, a strong, movable timber or iron grating let into the wall of the gateway to a feudal castle, and capable of being lowered or raised at will. It formed an effective protection against attack in the days before firearms.

Portland Cement is a mixture of about 20 parts of clay with 80 parts of chalk, specially prepared in kilns, and forming a substance which, after admixture with water, will set hard and solid.

Portland Vase, one of the most renowned specimens of Greek Art, long in the possession of the Portland family. In 1810 it was placed on loan in the British Museum, and in 1845 was smashed to pieces with a stone by a maniac; but, having been cleverly restored, it was exhibited in the Jewel room. It was discovered in the 17th century near Rome in a marble sarcophagus, and is supposed ,to have been the cinerary urn of the Emperor Severus. It was purchased from the Barberini family in 1770 by Sir Wm. Hamilton, subsequently sold to the Duchess of Portland. The vase, which is actually a two-handled urn, stands about 10 ins. high, is of transparent dark blue glass, ornamented with figures in relief in white enamel. The vase was removed by the owner from the British Museum in 1929 and sent to Christie's but withdrawn at 29,000 guineas. It was finally purchased by the British Museum in 1945, and restored in 1949.

Portreeve in olden times was an official appointed to superintend a port or harbour, and before the name of mayor was used the chief magistrate of London was styled the Portreeve.

Positivism, a system of philosophy propounded by August Comte (1798–1875), rejecting all metaphysical conceptions; a species of utilitarianism.

Positron, the "positive electron," an atomic particle having the same mass but an electric charge equal but opposite to that of an electron. It was discovered in 1932. *See also* **F12** (1), 13.

Post Office. The mail-carrying system of the British Post Office developed out of the organisation for the conveyance of State despatches by Royal messengers. The first Master of the Post was in office as a Court Official by 1516. In 1635 the State service was extended by Royal proclamation to cater for the conveyance of public correspondence on payment of fixed rates of postage, but the intervention of Civil War delayed the development of the scheme. In 1657, however, Cromwell created the Post Office under the control of a Postmaster-General responsible to Parliament, and Charles II. confirmed this arrangement. Since then the General Post Office has constituted one of the three great revenue-earning Departments. The modern conception of letter post with a uniform rate of postage by weight and irrespective of distance, and prepayment by means of adhesive stamps, dates from 1840, as the result of the great postal reforms of Sir Rowland Hill. The Money Order service was inaugurated in 1792, the Post Office Savings Bank in 1861, the Postal Order service in 1881, and Parcel Post services in 1883. The Telegraph system was taken over and extended in 1870, whilst the Telephone system, apart from the local services still operated under Crown licence by the Hull Corporation and in Jersey and Guernsey, was taken over completely by the Post Office in 1912. The growth of the work of the Post Office since the introduction of Uniform Penny Postage has been phenomenal and has amply justified the measure. *See* **N13** for London Postal Districts.

Potassium, a metal discovered by Sir Humphry Davy in 1807, and now generally obtained by the electrolysis of fused potassium hydroxide or chloride/fluoride mixture. Its principal minerals are carnallite and kainite, and it is relatively common in rocks, accounting for about 2½% of the earth's crust. An essential element for healthy plant growth; the ashes of plants are relatively rich in potassium.

Potsdam Agreement was signed by President Truman, Generalissimo Stalin, and Mr. C. R. Attlee in Aug., 1945. By this Agreement a Council of Foreign Ministers was established, representing the five principal Powers: China, France, Soviet Russia, the United Kingdom, and United States of America, with the task of drawing up the peace treaties for submission to the United Nations. It laid down, *inter alia*, that German militarism and Hitlerism should be destroyed; that industrial power should be so reduced that Germany would never again be in a position to wage aggressive war; that surplus equipment should be destroyed or transferred to replace wrecked plant in allied territories; that Germany should be treated as an economic whole; and that local self-government should be restored on democratic lines as rapidly as was consistent with military security.

Pot-Wallopers, the name applied to certain electors who, prior to the Reform Act of 1832, were permitted to receive the franchise on producing proof that they had, as the phrase went, "boiled their own pot" (were householders) in the constituency.

Poultry Compter was one of the old London City prisons, and stood in what is now called the Poultry. The Poultry Chapel was built on the site of the Old Compter in 1819.

Prado Gallery, the great public picture collection of Madrid, containing a superb collection of paintings by Velasquez, Murillo, Raphael, Titian, Dürer, Van Dyck, Rubens, Holbein, etc.

Pragmatism is the philosophical school of thought

which believes that the test of any theory or belief should be its practical consequences. The American philosopher and psychologist William James (1842–1910) was one of the first Pragmatists. He believed that it was impossible to discover the "real" world outside our senses, and we must therefore concern ourselves primarily with human experience. Since the universe would be a worse place without a belief in human responsibility, morals, and the freedom of the will, it was necessary, he considered, to believe in these concepts. Pragmatism is essentially an American school of thought and has had few supporters elsewhere. John Dewey (1859–1952) has had a great influence on American education and political thought. Dewey believed that we can never know the answer to the fundamental questions of the universe or discover anything outside our immediate experience. Such problems are, therefore, of no importance to us; our main concern must be the practical problems of living.

Prairie Dogs are common rodents in Western America and very like the marmot in general structure. They live in communities in burrows.

Prawns, crustaceans allied to lobsters, shrimps, and cray fishes.

Prebendary, a clergyman who receives a prebend or stipend because of his special connection with a cathedral or cathedral church.

Predestination, the Calvinistic doctrine that God from and to all eternity predestined everything to happen as it does and must happen, even to the fixing of the souls to be rewarded and punished.

Prefect, chief magistrates in ancient Rome. The title is now applied to the chiefs of administration of the departments of France.

Prelude, a piece of music intended to precede another piece, *e.g.*, Prelude and Fugue. The name has been used by many composers (*e.g.*, J. S. Bach, Chopin) to describe short compositions for which no following piece was written.

Pre-Raphaelites, a school of artists formed about 1848, and including among its exponents Millais, Rossetti, Holman Hunt, and others, whose ideal was absolute fidelity to Nature. For a time the school kept well together, and exercised much influence upon art developments; but although much of their work still pleases, the movement was out of date by the end of the century. Ruskin in his writings defended their work. *See* **G57** (1).

Press-Gang, a body of sailors employed to impress men into naval service, frequently resorted to in England, especially during the war with France in the early 19th century. Press gangs were not used after that.

Primogeniture, the right of the first-born male child to inherit the real estate of his father in the absence of direction by will or deed to the contrary.

Primrose League, founded in 1883 to commemorate Lord Beaconsfield's (Disraeli) political work and to promote the principles he advocated. The anniversary of his death, Apr. 19th, is called Primrose Day.

Printing by movable types was first used by Johann Gutenberg, a citizen of Mainz about 1440. The invention is also claimed for Laurens Koster of Haarlem. It was introduced into England by Caxton, who set up a printing press in Westminster in 1476. Gothic characters were first used, being superseded by Roman letters in 1518. In 1798 Earl Stanhope replaced the wood printing press by one of iron. In 1814 Friedrich Koenig applied the principle of steam power to the press. Mr. John Walter, of *The Times* newspaper, was the first to use the steam press which printed 1,100 sheets per hour. Improvements were introduced by Applegath and Cowper in 1828 and great strides were made in 1858 when the Hoe machine, which turned out 20,000 impressions an hour, was put on the market. Then came the Walter press in 1866 which printed on continuous rolls of paper from curved stereotyped plates. Modern Hoe machines can print a 48-page paper at 28,000 copies an hour (max. speed 50,000). The Monotype machine casts single letters and the Linotype whole lines.

Privateers were ships of private individuals licensed in time of war to seize and plunder the ships of the enemy. Privateering was abolished by the Declaration of Paris in 1856.

Privy Council. *See* **C8** (1).

Protestant, as a denominational term, was first applied to the Lutherans, who, in 1529, protested against the encroaching power of papacy.

Protocol, diplomatic term denoting the first draft of any important document to be used for political purposes.

Proton, a basic constituent of the atomic nucleus, positively charged, having a mass about 1840 times that of the electron. *See* **F10** (2), **13**.

Protoplasm, the jelly-like mixture of compounds of which living matter is formed. The elements present in protoplasm in the greatest amounts are carbon, oxygen, hydrogen, and nitrogen. No attempt to make protoplasm synthetically has succeeded. *See* **F58** (1).

Provost, a Scottish official similar to rank to an English mayor. The Provosts of Edinburgh, Glasgow, Aberdeen, Perth, and Dundee are styled Lords Provost. The title of provost is also given to the heads of various English colleges.

Prud'hommes (Prudent Men), **Councils of**, were French trade tribunals, of masters and workmen, formed to decide on disputes. Originally a mediæval institution, they were revived by Napoleon in 1806, and were carried on by the Third Republic.

Psalms, Book of, for many years attributed to David, but present-day scholars are of opinion that the psalms were written by a series of authors at different times and for different purposes, and that few, if any, were written by David. The Holy Scriptures contain 150.

Psychical Research. It need hardly be said that occult happenings and mysteries have been described from the earliest times. But modern spiritualism has a much shorter history, dating, to be precise, from Mar. 31, 1848, when the two Fox sisters of Hydesville, New York, began to produce mysterious rappings which were interpreted as spirit messages. The rapping movement spread like wildfire, and seances became popular, culminating in those of the medium Daniel Dunglas Home (1833–86), who impressed such famous men as Sir William Crookes and Alfred Russel Wallace and so unfavourably impressed the poet Browning. In 1882 the Society for Psychical Research was founded to study the phenomena of spiritualism scientifically, and counted among its members Sir Oliver Lodge, Barrett, Andrew Lang, Myers, and Sidgwick. Many phenomena have been investigated: apparitions, poltergeists, materialisations, telepathy, and precognition, but it is fair to say that no positive proofs of the existence of ghosts or of survival of bodily death have yet been found. Many mediums have been caught out cheating at one time or another—but this does not mean to say that they always cheat. Most moderate enquirers would take the view that many of the phenomena described do occur, but would deny that they are necessarily due to disembodied spirits. (*See also* **Telepathy**.)

Psycho-analysis is the name of the system of psychology devised by Sigmund Freud (1856–1939). Primarily intended as a means of treating neurosis, it resulted in theories as to the nature of mental processes which have, in part, at least, been accepted by the science in general. The basic thesis of the system is that the primitive mind of the child becomes differentiated into three aspects: the unconscious, a reservoir of the instincts and those thoughts and emotions which are unacceptable to the individual or society; the conscious mind or ego, in immediate contact with the world of reality; the superego, which represents the moral traits impressed on the child by its parents in early life. The unconscious is the source of all mental energy, which must, however, be modified in various ways before reaching consciousness by the superego (censor). Thus aggressive desires may be: (1) *expressed*, *i.e.*, allowed expression in their crude form, but on a socially recognised occasion (war, boxing, etc.); (2) *sublimated*, *i.e.*, made "sublime" by expression in a more highly developed form (competition in games, business, etc.); (3) *suppressed*, *i.e.*, held down consciously as being

inappropriate; (4) *repressed, i.e.*, held down and refused recognition unconsciously. In the latter case the desires are liable to lead to neurotic symptoms, since they will find their way into awareness in a less obvious manner (*e.g.*, a morbid interest in cruelty, murders, etc., or an excess fear of losing one's temper). Neurosis is due to conflict between the super-ego and the unconscious. *See also* **Freudian Theory, F36** (2).

Psychology, usually defined as "the study of the mind," has more recently been described as "the study of behaviour," since the term "mind" is somewhat ambiguous. (*See* **Mind.**) The first important psychologists (as distinct from philosophers) were the Germans Wundt and Herbart in the 19th century; the science is, therefore, a comparatively new one. Three phases have been evident from quite early days; (1) An Associationist phase during which an effort was made to isolate the units of mental life; at first these were described as "ideas," but later the Behaviourist school made the reflex its fundamental unit. The Associationists and Behaviourists regarded the mind in a somewhat mechanistic way in terms of stimulus and response, rather like a penny-in-the-slot machine. In fact, the Behaviourists denied the existence, or at any rate the value, of subjective data—they considered that psychology should concentrate on the observation of behaviour. Leading members of this school were Pavlov and J. B. Watson. (2) With Freud and, earlier, Herbart, emphasis was on the dynamic aspects of mind. The mind, it was supposed, must have some driving force behind it—the instincts. The Freudian system is based on this concept. (*See* **Psycho-analysis.**) McDougall was another leader of the dynamic school with views otherwise widely divergent from Freud. Some of the fundamentals of both these views have been discarded by the most recent school of thought represented by: (3) Field theory. This scheme is based on the denial of the Behaviourists' thesis that the mind can be divided up into units—behaviour, it is claimed, can be understood only in its whole social context. This also brings Field theorists into conflict with the Freudians and their belief that all behaviour comes from within—from the unconscious. The most radical form of this approach is Situationism, which holds, more or less, that an individual is nothing but the social roles he plays; his actions are the resultant of many and perhaps conflicting roles as father, son, Protestant or Catholic, employer or employee. But the views of this typically American school are not generally accepted in their entirety elsewhere. It must be remembered, in face of all these conflicting views, that there are very large areas of agreement between all psychologists, and much of the apparent confusion is due not to disagreement over facts but in the fitting of facts into coherent schemes.

Ptarmigan, birds of the grouse family, one species of which occurs in Britain, inhabiting the Scottish Highlands. In the winter assumes a white plumage.

Ptomaines, organic compounds produced during the putrefaction of proteins of animal origin. Not a cause of food poisoning, as was once generally supposed, which is almost invariably due to certain specific bacteria.

Publicans, under the Roman Empire, were people who farmed the public taxes. It is this class of officials that is alluded to in the "publicans and sinners" phrase in the New Testament.

Public Corporations. A method of operating large-scale industries transferred from private to public operation. Thus the Port of London Authority is an independent corporation governed by users of the port and representatives of municipal interests and labour. The Forestry Commission, the Electricity Authorities, the British Transport Commission, the National Coal Board, the Gas Council, and the B.B.C. follow a varied pattern.

Public Schools. The Public Schools Act of 1864 named nine "public" schools: Eton, Harrow, Rugby, Winchester, Westminster, Shrewsbury, Charterhouse, St. Paul's, and Merchant Taylors. Today the term embraces many more, and can be applied to all those schools which are financed by bodies other than the State and whose headmasters belong to the Headmasters' Conference as distinct from the Headmasters' Association. There are about 200 such schools in Britain, including among others: Bedford Grammar School (founded 1552); King Edward's School, Birmingham (1552); Brighton College (1845); Charterhouse School, Godalming (1611); Cheltenham College (1841); Christ's Hospital, West Horsham (1552); City of London School (1442); Clifton College, Bristol (1862); Dulwich College (1619); Eton College (1440); Felsted School (1564); Haileybury College (1862); Harrow School (1571); Malvern College (1865); Manchester Grammar School (1515); Marlborough College (1843); Merchant Taylors' School (1561); Mill Hill School (1807); Oundle (1556); Radley (1847); Repton School, Derbyshire (1557); Rugby School (1567); St. Paul's School (1509); Sherborne School (1550); Shrewsbury School (1552); Stonyhurst College (1594); Tonbridge School (1553); Uppingham School (1584); Wellington College (1859); Westminster School (1339); Winchester College (1387); and Warwick (1123). Public schools for girls include: Christ's Hospital, Hertford (1552), Cheltenham Ladies College (founded by Miss Beale in 1853), North London Collegiate School (founded by Miss Buss in 1850), Roedean (1885), Wycombe Abbey (1896).

Puma, a carnivorous quadruped of N. America, where it is called the "American lion," though smaller than the lion, seldom attaining a greater length than 40 in., exclusive of tail, and a height of 2 ft.

Pumice, a light stone of variable substance, utilised for cleaning purposes, for polishing, and for smoothing surfaces and edges of pasteboard and surfaces of wood, metal, and other material. It is imported from the Lipari Isles.

Puritans, the name originally given to the followers of Calvin in England in the time of Elizabeth. As a political party they were in the ascendant during the Commonwealth period (1649–59).

Pyramids of Egypt, on the west bank of the Nile, are vast stone or brick-built structures with inner chambers and subterranean entrances, built by the Pharaohs as royal tombs and dating from about 3000 B.C. The most celebrated are at Giza built during the 4th dynasty. The largest, originally 481 ft. high, is called the Great Pyramid, one of the seven wonders of the world, built by the Pharaoh Khufu, better known as Cheops, and there he was buried, 300,000 men, according to Herodotus, being employed for 20 years upon it. Chephren, successor of Cheops, erected the second pyramid, and the third was built by Mycerinus, a son of Cheops. The pyramid at Meidum built by King Snefru, founder of the 4th dynasty, is the most imposing of all. (*See also* **Art of Egypt, Section G.**)

Pythian Games were one of the four great Greek festivals in honour of Apollo and Diana, when many contests were held on laurels distributed as prizes. These games took place every fourth year near the temple of Delphi

Pythons, large snakes, non-poisonous, and destroying their prey by crushing it. Some species average 30 ft. in length, and prey upon deer and other small mammals. Found in Asia, Africa, and Australia.

Q

Quadragesima Sunday is the first Sunday in Lent, the fortieth day before Easter.

Quadrant, an astronomical instrument for measuring altitudes, superseded for navigational purposes in modern times by the sextant. It consists of a graduated arc of 90° with a movable radius for measuring angles on it.

Quadrille, adapted from an old French country dance, became fashionable throughout Europe in the early part of the 19th century, but seldom danced now.

Quæstor, a Roman magistrate whose duties were mainly financial, although he was originally concerned with criminal jurisdiction. At first two Quæstors sufficed; then the number was successively increased until under Julius Cæsar there were forty. Under the Empire there were usually twenty.

Quai d'Orsay. An embankment in Paris where the French Foreign Office is situated.

Quail, an edible bird of the partridge family, of which only one species, the Common Quail, is found in England. It is not more than 8 in. long. It is found in most of the warmer regions of the world. In England and Wales the Quail is covered by the Wild Bird Protection Acts.

Quair, an old name for a pamphlet or little book.

Quakers, the popular name for members of the Society of Friends, a religious sect founded by George Fox in the 17th century. In matters of belief they do not differ materially from other Protestant bodies; the chief difference is in worship, Quakers having no prescribed formulas. They assemble in their Meeting Houses, and any one in the congregation speaks when individually prompted, "as the Spirit moves them." Silent meetings are not infrequent. The ordinances of baptism and the Lord's Supper they reject. They object to swear upon oath, and up to 1833 were punishable by law for this refusal; since then they have been permitted to affirm. Until recent times they adopted great simplicity of attire, and in addressing people used the second person singular, but gradually have conformed more to common usage. Many Friends have attained distinction both in public life and in business, and as a body they are highly respected for their honourable dealings. William Penn was one of the most prominent of the early Quakers, and introduced the religion into America. The term Quaker was first applied to the sect because of the founder's frequent use of the word "tremble" in his exhortations.

Quantum Theory. *See* **F12** (2).

Quarrel, the old name for a dart or bolt, shot from a crossbow or catapult in war, before the employment of firearms.

Quartering, in heraldry, is the disposition of various escutcheons or coats of arms in their proper "quarters" of the family shield, in such order as indicates the alliances with other families.

"Quarterly Review," the great Tory quarterly was started in 1809, in opposition to the *Edinburgh Review*, the Whig organ, est. in 1802.

Quartermaster, a military officer charged with the provisioning and superintendence of soldiers in camp or barracks, and holding the equivalent rank to a lieutenant. The Quartermaster-General is an officer who presides over the provisioning department of the whole army. A Quartermaster in the Navy is a petty officer responsible to the Officer of the Watch; at sea for the correct steering of the ship and in harbour for the running of the ship's routine.

Quarter Sessions. *See* **C11** (1), **D6** (1).

Quarter-staff, an old English weapon, consisting of a stout pole some 6½ ft. long, which was grasped in the middle and could be swung with telling force in defence or attack.

Quartet, a musical composition for four voices or instruments. If for stringed instruments (*e.g.*, first and second violin, viola, violoncello) it is called a string quartet. If for three strings and another instrument it is called by the name of the fourth instrument, *e.g.*, piano quartet. The name is often misapplied to the musicians instead of to the music. Thus a four-piece string orchestra will be called a string quartet. This misuse is also found with quintet, sextet, etc.

Quarto, a sheet of paper folded twice to make four leaves, or eight pages; usually abbreviated to "4to."

Quartodecimani, an early Christian community who celebrated the Paschal festival on the 14th day of the month, when the Jews celebrated their Passover. In consequence of the confusion caused, the practice of the Quartodecimani was condemned by the Council of Nicæa in 325.

Quartz is a common and usually colourless mineral, abundantly diffused, and occurring crystallised and massive. In the first form it is in hexagonal prisms, terminating in pyramids. When pure its specific gravity is 2·66. It is one of the constituents of granite, gneiss, etc. Among the quartz varieties are *rock crystal* (colourless), *smoky quartz* (tinged, as *yellow topaz*, *amethyst*, and *sapphire*), ordinary or false, *milky quartz*, and *rose quartz*. Quartz veins in metamorphic rocks often yield rich deposits of gold. Mining for gold in the rock is termed quartz-mining.

Quasi, a Latin prefix to other words implying a somewhat false resemblance.

Quaternary Deposits *or* **Post-Tertiary**, are the latest stratified rocks of the earth's crust, and include the Pleistocene ("Great Ice Age") and recent systems.

Quatrefoil, in architecture an ornament, piercing, or panel, resembling the four petals of a cruciform flower, largely used in English Perpendicular style, and less frequently in the Decorated.

Quaver, a note of music, equal to one-eighth of a semibreve and one-fourth of a minim.

Queen Anne's Bounty, established by Queen Anne in 1704 for the augmentation of the maintenance of the poor clergy. Since April 1, 1948, Queen Anne's Bounty and the Ecclesiastical Commissioners ceased to exist and became embodied in the Church Commissioners for England.

Queen's (or **King's**) **Speech** is the speech prepared by the Government in consultation with the Queen and delivered by Her Majesty in person or by her deputy, at the opening or closing of a Parliamentary session.

Quern, a form of stone hand mill for grinding corn, in use in early times. It consisted of two flat stones, the upper revolving on a pin inserted in the lower.

Quicksilver. (*See* **Mercury**.)

Quills for writing with were first used in the 6th century, and superseded by steel pens in the 19th.

Quince, a well-known hardy orchard tree of the pear family, bearing fragrant, yellow, pear-shaped fruit, largely used for preserves. A mucilage is made from the seeds, which also possess medicinal virtues.

Quindecemvir, one of the fifteen ancient Roman magistrates appointed to keep charge of the Sibylline books, and called priests of Apollo.

Quinine, a vegetable alkaloid obtained from the bark of several trees of the *Cinchona* genus. It is colourless and extremely bitter. The drug, sulphate of quinine, is one of the most valuable medicines, forming a powerful tonic. It is anti-periodic, antipyretic, and antineuralgic. In cases of malaria it is the most efficacious remedy of natural origin known.

Quintain, a tilting post, from the top of which a board was suspended horizontally for the tilters to strike at with their lances.

Quintal Metrique, a French weight of 100 kilogrammes, or 220 lb. avoirdupois.

Quintet, a musical composition for five voices or instruments. If all five instruments are strings the piece is a string quintet. A clarinet quintet, for example, is a piece scored for "four strings" and a clarinet.

Quirinal, one of the seven hills of Rome.

Quisling, term which came into use during the second world war to denote traitor, collaborator, or fifth-columnist. After Vidkun Quisling, who became head of the puppet government after the German invasion of Norway in 1940.

Quiver, a leather receptacle for arrows.

Quorum, the number of members of any body or company necessary to be present at any meeting or commission before business can be transacted. Forty form a quorum in the House of Commons.

Quo Warranto ("By what authority") a form of writ which has existed in England since 1278, and is a direction to the proper authorities to inquire into the circumstances under which any office or franchise is held.

R

Rabbi, a Jewish term applied to specially ordained officials who pronounce upon questions of legal form and ritual, and also generally accorded to any Jewish scholar of eminence.

Rabbit, a rodent burrowing mammal, a native of Europe, but now common in other countries—where it has been introduced and has multiplied enormously, especially in Australia. (*See* **Myxomatosis**.) In its wild state it has a brownish fur, while in its domesticated varieties it is of many colours—grey, white, black, and pied. Wild rabbits have erect ears, but in some do-

mestic breeds the ears are long and droop, hence the term lop-eared. They breed rapidly, rearing several litters a year. The fur is utilised for clothing and other purposes, and the flesh is a popular article of food. *See* **Z17**.

Raccoon, plantigrade carnivorous mammals common to the American continent. There are several species. The common Raccoon (*Procyon lotor*) is about 2 ft. long, with a bushy ringed tail and sharp snout. Its skin is valuable.

Race. In the old text-books anthropologists were much concerned with the differences between the various races of Man: they described the Black Man (Negro), the Yellow Man (Mongol), the Red Man (American Indian), the Brown Man (Indian), and the White Man (European). Those who study Man from this point of view further subdivide each group into others. Thus White Man may be divided into Nordic, Alpine, and Mediterranean; Black Man into Hamitic, Bushman, and so on. Each of these groups tends to have physical traits which its members hold in common, although, of course, there are no *pure* racial types. All existing races have been fairly thoroughly mixed. What, in view of recent experience, is really important, is that races or even nations do not have psychological traits—at least not *innate* traits. The man who says that all Indians are stupid or liars or worse forgets that Indians were highly civilised when our ancestors were dressed in skins and painted blue. Such a man might read with profit what Cicero wrote to a friend in the first century B.C.: "Do not obtain your slaves from Britain, because they are so stupid and so utterly incapable of being taught." Anthropology dismisses all theories of a superior race as unscientific: there is not the slightest evidence that one race differs in any way from another in its psychological potentialities. Jews, Irish, Scots, Italians do differ (so do the inhabitants of Edinburgh and London): but their differences are due to their situation and not to anything inborn. *See* **Physical Environment, F33.**

Raceme, a botanical term indicating a cluster of flowers, the individual blossoms being borne on simple stalks arranged round a single common axis. The youngest flowers are at the tip of this axis.

Radar. See **X16–18.**

Radcliffe Library, Oxford, was founded under the will of Dr. John Radcliffe, who died in 1714, leaving £40,000 for that purpose. The Library was opened in 1749.

Radiation, transfer of energy by electromagnetic waves, the rate of emission by a body depending upon its temperature and surface. The sun radiates energy in the form of short visible waves of light and longer invisible waves of heat. The principal gases of the atmosphere are transparent to practically all of the solar and sky radiation and also that which the earth re-transmits to space. Carbon dioxide and water vapour, however, strongly absorb certain types, the latter, as clouds, playing an important rôle in regulating the temperature of the globe. The cooling of the ground on a clear night is a result of the outgoing long-wave radiation exceeding that coming down from the sky; at sunrise cooling ceases as the incoming radiation becomes sufficient to compensate for the loss of heat.

Radiations, Biological Effects of. *See* **F63.**

Radioactivity. *See* **F60.**

Radiosonde, a weather station in miniature carried aloft by a free balloon to heights normally in the neighbourhood of 10 miles. Signals representative of values of atmospheric pressure, temperature and humidity are transmitted simultaneously by radio to receiving apparatus on the ground. The position of the balloon at any instant can be determined by radar, enabling the speed and direction of the upper winds to be deduced.

Radium, a radioactive metal discovered by Marie and Pierre Curie in 1898. Atomic weight 226. The Radium Institute, founded and equipped by Lord Iveagh and Sir Ernest Cassel, was opened in Aug., 1911, for the treatment of patients and the prosecution of researches into the effect of radium on the human system.

Radon, a colourless radioactive gas formed when radium atoms disintegrate radioactively.

Rail, a well-known genus of the *Rallidae* family—three species of which—the Water Rail, the Moorhen, and the Coot—are resident in the British Isles.

Rain. When moist air rises into lower temperatures and becomes saturated, condensation takes place on the numerous hygroscopic particles present in the atmosphere. If the temperature is above freezing a cloud of small droplets is formed, and as the air continues to rise they grow in size until the weight is great enough to make them fall to the earth as rain. The formation of large raindrops has been attributed to coagulation of smaller drops of different sizes, while another mechanism depends upon the presence in the cloud of ice crystals as well as water drops. In temperate latitudes snowflakes falling from the freezing level melt in the warmer air below, producing large raindrops which grow in their flight through the lower part of the cloud.

Rainbow, a beautiful colour effect visible to an observer with back to the sun and facing a rain shower, caused by the refraction and reflection of sunlight in minute water-droplets in the air. From high in the air it would be possible to see a rainbow as a complete circle, but from the ground the most that can be seen is a semicircle when the sun is just on the horizon; the higher the sun is, the smaller the arc of the rainbow. When conditions are suitable two bows are seen, the secondary with the colours of the spectrum reversed. The colours of the rainbow are seven: red, orange, yellow, green, blue, indigo, and violet—the colours of the spectrum.

Raingauge, an instrument consisting of a deep metal funnel whose stem dips into a graduated glass jar from which the depth of the rain water collected can be read. Continuous records of rainfall are provided by self-registering instruments.

Ramadan, the time of the Mohammedan Lent, the 9th month of the Moslem year, a movable period fixed according to lunar calculations. It lasts for thirty days, and all good Mohammedans fast in Ramadan from sunrise to sunset each day. During the interval from sunset to sunrise they are at liberty to eat, drink, and make merry.

"**Rambler, The,**" published by Dr. Johnson twice a week between 1750 and 1752.

Rambouillet, a royal French château (14th century, rebuilt 18th century), near Paris, and the official summer residence of the President of the French Republic. Also the name of the famous literary salon of the Marquise de Rambouillet (1588–1665).

Rampant, in heraldry, is a term applied to the figure of an animal with forelegs elevated, the dexter uppermost. When the animal is shown side-faced it is *rampant displayed*, when full-face, *rampant guardant*; when looking back, *rampant reguardant*; and when in sitting position *rampant sejant*.

Ranelagh Gardens was a fashionable public garden at Chelsea for concerts and dancing in the 18th century, and existed down to 1804.

Ranz des Vaches, a Swiss herdsman's melody, played on the alpenhorn, as a call to the cows.

Rapacki Plan. A plan proposed by Adam Rapacki, the Polish Foreign minister, on Oct. 2, 1957 in the U.N. General Assembly for a demilitarised zone in E. and W. Germany, Poland and Czechoslovakia. The plan involves a ban on nuclear installations and the use of nuclear weapons against the zone from outside. The plan, though not acceptable to the Western Powers in its original form, has nevertheless been the basis of discussion for talks among the nations on ways of reducing international tension. *See also* **C20.**

Rape, a cruciferous plant yielding coleseed or rapeseed, extensively grown in all parts of Europe and India. Rape oil or colza is made from the seeds, and the leaves and refuse are used for sheep-food. Rape oil is a yellow, thick oil, of considerable commercial importance as a lubricant and for other purposes. It was at one time much used as an illuminant.

Rare Animals. At a meeting of the International Union for the Conservation of Nature held in

Athens in Sept. 1958, it was stated that several wild animals were in danger of extinction, including the Ice Age horse (known to zoologists as Prejalvski's horse), Bactrian camel, Tasmanian wolf, Asian rhinoceros, Monk seal, Asian lion, Cambodian wild cattle, and the giant eland of Africa. Protection was also urged for the black-and-white giant panda of China, and for Clarke's gazelle of British E. Africa, threatened because there is a native belief that the fat of the animal is good for rheumatism.

Rastadt Treaty of Peace, between the French and Germans, signed on March 7, 1714, closed the War of the Spanish Succession and was a preliminary to the Treaty of Utrecht.

Rat, a well-known order of rodent embracing many species. The *brown rat* appeared in Europe early in the 18th century, coming from the East and entering by way of Russia; now it is widespread and met with in Britain and all parts of the Continent. The *black rat*, which was the common rat before the arrival of the brown species, is a smaller animal and now comparatively scarce. There are numerous other kinds, all of them gross feeders, and existing in such numbers in many places as to constitute a pest. *See* **Z13**.

Rationalism. The belief that all matters of fact and all beliefs concerning personal conduct should be founded on reason; that reason should be the guiding factor in life. An apparently simple creed, which, unfortunately, is not so simple. Roman Catholics, for example, who are certainly not rationalists in the ordinary sense of the term, claim to be able to base their religion on rational grounds; indeed, there must be very few people who do not consider their beliefs to be entirely reasonable. The rationalist would say that by "reason" he means the criteria ordinarily accepted as scientific evidence, but he is then faced by the problem whether moral conduct can be based entirely on logic. The most important attempt to do so (Bentham's theory that morals should be based on "the greatest good of the greatest number") has been rather severely dealt with by philosophers in general. Rationalism has something important to contribute to human well-being provided it realises that human beings are not ordinarily rational, and one must be tolerant of what seems illogical in their conduct before beginning (very slowly) to alter their beliefs. Our irrational dreams are, after all, an attempt to make a difficult world easier to live in, and the man in the street may be excused if he says, in effect, to the rationalist, "be careful, you are treading on my dreams." Only by making the world a better place to live in can one begin to convert the superstitious and illogical. The main rationalist body in this country is the Rationalist Press Association, Johnson's Court, Fleet Street, London, E.C.4.

Rattlesnake, venomous snakes which obtain their name from the possession of a rattle in the end of their tail, consisting of horny pieces so arranged that when vibrated they make a rattling sound. They are only found in N. and S. America.

Raven, a black-plumaged bird of the crow family, with raucous voice and massive bill. Occurs in many parts of Europe, Asia, and America. Ravens are easily domesticated and form interesting pets. Dickens had one which he described in *Barnaby Rudge*.

Ray, fish with a very flat body and broad and fleshy pectoral fins, related to the sharks. There are about 140 species. In Britain they are generally called *skate*.

Razorbill, a sea-bird of the auk family, having a high, furrowed bill and black-and-white plumage. It inhabits rocky cliffs during the breeding season, and at other times is mostly out on the open sea. Razorbills pair for life and return to last year's nesting-place.

Recitative, a style of singing only slightly removed from ordinary speaking, used in the narrative portions of operas and oratorios. In older operas "recitativo secco" (dry recitative) was used, the voice being accompanied by the harpsichord alone. After Scarlatti the orchestra was used to give a more dramatic touch to the recitative, while Verdi introduced a type of recitative that was half-way to an aria.

Recorder, a judge of a city or borough having a court of quarter-sessions. The Recorder of the City of London is elected by the Lord Mayor and Aldermen, but other recorders are barristers of eminence appointed by the Crown.

Record Office, in Chancery Lane, London, the place where the Public Records of England are now preserved, including Domesday Book, the various Rolls of Charters, and important historical documents from a remote period.

Rector, in England an ecclesiastical title of the incumbent of a parish where the tithes are not impropriate; also the head officer of some of the Universities and Colleges.

Recusants, people who refused to attend the Anglican Church or to acknowledge the ecclesiastical supremacy of the Crown in the 16th and 17th centuries.

Redan, a fortification consisting of two parapets or mounds of earth in angle form, the apex pointing outward.

Red Army. The Army of the Soviet Union, so-called because it bears the red flag of the Soviet revolution. Its official title is the Red Army of Workers and Peasants.

Redbrick, a term used to denote a university of modern foundation whose buildings are conceived as being built of red brick in contrast to the stone of the ancient universities.

Red Crag, the name given to a strata of gravel or sand, containing certain fossil mollusc deposits, found on the Suffolk and Norfolk coasts.

Red Cross. (*See* **Geneva Convention.**)

Rede Lecture, at Cambridge University, was instituted and endowed in 1524 by Sir Robert Rede, Chief Justice of Common Pleas. These lectures were superseded by an annual oration, which is usually given by an eminent scientist

Red-Letter Day, a Church festival day indicated in the Prayer Book by red letters, now a popular term for any day of special significance.

Redoubt, a term applied to enclosed fortified work, especially to a small area temporarily fortified as a place of retreat for a defending force.

Redstart, a small bird of the Thrush family of handsome plumage and striking song. Two species visit Great Britain; the Common Redstart, with bright chestnut rump and tail, white forehead, and black cheeks, favours wooded country, and the Black Redstart, with black breast and throat, chestnut tail and white wing bars, prefers rocky ground or bombed buildings, and has recently begun to breed in S. England.

Redwing, a bird of the Thrush family which finds its way to this country for the winter. Resembles the song thrush, but distinguished by smaller size, buffish-white eye-stripe, chestnut flanks and underwings. It has bred in Scotland and on Fair Isle.

Redwood *or* **Sequoia.** This genus of coniferous tree comprises two species of Redwoods occurring in N.W. America. Specimens of one species, the Giant Redwood, reach a height of over 300 ft. and a thickness of 36 ft. The age of the largest, the General Sherman tree, is put at 3,500 years.

Reed, the sound-producing agent (of thin cane or metal) of many musical instruments. Reeds are described as *free* or *beating*, and the latter as single or *double*, *i.e.*, two reeds placed together which vibrate when wind is forced between. Reed instruments include clarinet, harmonium, bassoon, oboe, bagpipe, mouth organ.

Referendum and Initiative, two methods by which the wishes of the general body of electors may be expressed with regard to proposed legislation. It is developed to the highest extent in Switzerland. In a referendum some specific matter is referred to the electors. The Initiative is the means by which the electors can compel their elected representatives to consider a specific matter. When it has been considered by the legislature it must then be submitted to the electorate for approval (*i.e.*, a referendum).

Reformation, the great religious movement of the 16th century, which resulted in the establishment of Protestantism. In the previous century Wyclif, Huss, and others had sounded the warning note, and when later on Luther took up the cause in Germany, and Zwingli in Switzerland, adherents soon became numerous. The wholesale vending of indulgences by the Papal agents had incensed the people, and when Luther denounced these things he spoke to

willing ears. After much controversy, the Reformers boldly propounded the principles of the new doctrine, and the struggle for religious supremacy grew bitter. They claimed justification by faith, and the use as well as the authority of the Scriptures, rejecting the doctrine of transubstantiation, the adoration of the Virgin and Saints, and the headship of the Pope. Luther was excommunicated. But the Reformation principles spread, and ultimately a great part of Germany, as well as Switzerland, the Low Countries, Scandinavia, England, and Scotland were won over to the new faith. In England Henry VIII. readily espoused the cause of the Reformation, his own personal quarrel with the Pope acting as an incentive. Under Mary there was a brief and sanguinary reaction, but Elizabeth gave completeness to the work which her father had initiated.

Reformatory Schools, for the reclamation of juvenile offenders, originated in France in 1839. The Philanthropic Society of London founded such an institution at Redhill in Surrey in 1850. Since then many other schools of this class have been opened, under government authority and inspection. The Borstal System for industrial training and reclamation of prisoners between 16 and 23 was begun at Borstal near Rochester in 1902. These Institutions deal with many cases of juvenile delinquency.

Reform Bills. The principal Bills have been passed for the reform of the Parliamentary franchise. The first was that of 1832, which in addition to a sweeping redistribution of seats, granted the franchise to borough householders paying a £10 rental, and in counties to those with a rental of £50. The second Bill was passed in 1867, conferring the franchise on all borough householders paying poor rates, on lodgers paying £10 a year, and to tenants in counties paying £12. A third Bill, passed in 1884, practically gave household suffrage and effected a large measure of redistribution of seats. The Representation of the People (Equal Franchise) Act, 1928, gave women of 21 years of age the right to be registered as Parliamentary electors, thus adding several million names to the register.

Refraction. The change of direction which light rays and other rays undergo when passing from one medium to another. The phenomenon is due to the fact that in different media light (and other forms of radiation) has different speeds.

Regalia, the ensigns of royalty, such as the crown, sceptre, swords of State, etc., which, in the case of the British insignia, are kept in the Tower of London. In its stricter sense it means the prerogatives of royalty.

Regattas, boat or yacht races, were introduced into this country in 1775, when the Thames was the scene of one of these competitions. Since then they have become popular on the river and round the coast. Henley every year has a fashionable Regatta.

Regency Acts were Acts of Parliament passed in the reign of George III., appointing the Prince of Wales (afterwards George IV.) to the Regency during his father's mental incapacity.

Regicides, the commissioners who tried and condemned Charles I. They were 135 in number; 59 only could be induced to sign the death warrant.

Reichsrath, the name given to the Austrian Parliament until 1918. It comprised an Upper House of princes, nobles, and prelates and a Lower House of elected representatives.

Reichstag *or* **Diet**, the name given to the meeting summoned by the rulers of the mediæval Empire. After the unification of Germany the name given to the popularly elected house of the German parliament. The Reichstag building was destroyed by fire in 1933 by the Nazis.

Reign of Terror, a period of anarchy and bloodshed in the French Revolution which began in the spring of 1793 and practically ended with the fall of Robespierre in July, 1794.

Reindeer, a genus of deer horned in both sexes, occurring only in northerly regions. It has an average height of 4 ft. 6 in., is very fleet of foot, and the Laplanders utilise it for draught purposes.

Relativity, the theory in physics associated with the name of Professor Albert Einstein. The theory was published in two parts—the *Restricted Theory* in 1905 and the *General Theory* in 1915. It is based on the hypotheses that (i) space and time are closely connected and dependent on each other, (ii) the interval of space between two objects and the interval of time between two events are not absolute but relative, changing according to the circumstances of the observer, (iii) matter and energy are fundamentally the same, it being possible to convert one into the other. The laws of relativity have been substantially proved and have revolutionised our ideas as to the nature of space, time, matter, and energy and forced us to think along new lines. In 1949 a new theory by Professor Einstein was announced which sets forth in a series of equations the laws governing both gravitation and electromagnetism, which is said to bridge the gap that separates the infinite universe of the stars and galaxies and the equally infinite universe of the atom. At present the one is explained by relativity, and the other rests on the quantum theory. *See* **F14**.

Relief in sculpture is of three kinds—high relief (*alto-relievo*), in which the figures stand out to the extent of one-half of their natural proportions, low-relief (*basso-relievo*) when the figures project but slightly; and middle-relief (*mezzo-relievo*), when the projection is intermediate.

Renaissance, new birth or revival. It was a transitional movement in Europe between the mediæval and the modern which was exemplified by a return to classic ideals in literature, painting, and architecture. It was stimulated by the fall of Constantinople, the invention of printing, and the discovery of America. It began in 14th-century Italy, where it reached its highest glory in the 15th and 16th centuries. From Italy it swept over Western Europe; in England the movement was most notable in literature (Colet, More, Erasmus). *See* **G40–44**.

Rennet, a substance obtained from the fourth stomach of a calf or other suckling quadruped, and used for curdling milk, making junkets, etc.

Repeater, the name applied to a watch that will strike the hour, quarters, and minutes last past on the pressure of a spring.

Representative Peers are peers elected by their fellow peers to sit in the House of Lords—Scotland has 16, elected or re-elected for each Parliament. The number of Irish representative peers at the date of the establishment of the Irish Free State (1922) was 28. Through deaths their number has been reduced to 1 (1960) and the 27 vacancies are unlikely to be filled.

Reptilia, the class of vertebrate animals including tortoises, lizards, snakes, crocodiles. *See* **F24** (2).

Republican Party of the United States, one of the two great parties in U.S.A., the other being the Democratic Party. Sometimes regarded as the more right wing of the two parties but this view must be treated with caution as the parties do not fit a left and right wing pattern. The party before the second world war was predominantly isolationist. Pres. Eisenhower is a Republican and until his election as President in 1952, the Republican Party had not held power for 20 years. *See* **C28** (2).

Requiem. Properly a mass for the dead, the term is extended to cover musical settings by Palestrina, Mozart, Verdi, and others.

Reredos, the ornamental screen at the back of the altar or Communion table. It is often of a highly decorative character and is an architectural feature in many churches in Spain. Other examples are to be found in the following cathedrals in England: St. Paul's, St. Albans, Salisbury, Winchester, Durham, and Liverpool. In All Souls College, Oxford, one is to be seen actually attached to the wall.

Resins, natural resins are vegetable compounds largely employed in the industrial arts. They comprise india-rubber, amber, mastic, copal, etc. "Synthetic resins" is a term sometimes used as a synonym for "plastics."

Rest, a musical term denoting silence or cessation from playing for the period represented by the character of the rest. Thus there are minim, semibreve, quaver, and other rests, which represent the same lengths of silence as the notes themselves would represent in sound.

Retina, the layer of the eye which is sensitive to light.

Reuter, the chief British and international news agency, founded by Baron J. de Reuter in 1849.

Rhapsody, an instrumental composition, not in symphonic form, which suggests that it was composed to express some powerful emotion or ecstasy. Liszt's "Hungarian Rhapsodies" are based on old folk tunes, while it is believed that Gershwin's "Rhapsody in Blue" is intended to express the mood of America at the time it was written.

Rhea, a large flightless bird, the "ostrich" of S. America, distinguished from the ostrich proper by smaller size, longer beak, larger wings, no tail and 3 toes instead of 2. There are 2 species.

Rhinoceros, a large hoofed quadruped, of which there are nine existing species; native to the river and marsh regions of Africa, India, Borneo, and Java. It is remarkable for its thick hide and upturned snout, from which springs a long horn. The white rhinoceros, which is scarce, is the biggest species, attaining a length of 10–12 ft. and a height of from 5 to 6 ft. The black rhinoceros is the most familiar.

Rhodium, a metallic element, discovered by Wollaston in 1804. It is found in platinum ores in small amounts, generally less than 2 per cent. With platinum it gives a very hard and durable alloy. It is also used, instead of silver, in putting the reflecting layer on a mirror.

Rialto, a famous bridge that crosses the Grand Canal at Venice, and dates from 1591.

Ribbon Fish, is a deep-sea fish, deriving its name from the ribbon-like shape. Though many feet in length, it is only an inch or two thick. By reason of its keeping to the ocean depths, the ribbon fish is rarely met with, most of what is known about it having been learnt from specimens occasionally cast ashore during storms.

Ribbon Seal, a kind of seal found in the North Pacific, remarkable for being ornamented with an almost white broad band along its back and around its neck.

Rice, a grain-yielding grass, of which thousands of strains are known today, extensively cultivated in China, India, and certain parts of America, and forming the main food of the peoples of China, Japan, India, and the Malayan regions. Some 95 per cent. of the world's rice is produced and consumed in the Orient. The grain with the husk is known as "paddy." Arrack, an alcoholic liquor, is made from fermented rice seeds.

Richtfest, a traditional German ceremony held when the framework of a new building is completed; a large crown made of pine branches is decorated with coloured streamers and hoisted to the roof, where it remains until the last tile is laid. Afterwards all the workers employed on the site are invited to a feast.

Rider, the popular name of a Dutch gold coin first put into circulation in the 16th century, but not now in use. Its name was derived from its having engraved upon its obverse the figure of a horseman. It weighed about 50 grains. A coin of the same name was issued by James VI. of Scotland, afterwards James I. of England.

"Rights of Man," the title of the declaration of the French National Assembly in 1789, proclaiming that all men have equal rights. Also the title of a famous book by Tom Paine, justifying the Revolution.

Rime, a crystalline deposit of ice formed on objects exposed to wet fog at the same time as frost.

Rinderpest *or* **Cattle Plague**, is a highly contagious disease affecting cattle, sheep, and other ruminants. In Europe the disease has been eradicated, but it was formerly very widespread and caused great loss of life amongst cattle. The disease is caused by a filtrable virus, and is attended by fever and congestion of the mucous membranes.

Ring Dove *or* **Wood Pigeon**, a blue-grey bird, distinguished from other pigeons by larger size (16 in.), white wing-bar, glossy green-and-purple neck, and white half-collar. It is very common in Britain

Riot Act, The, was passed in 1714, its object being to prevent riotous assemblies. In times of disturbance when a breach of the peace is threatened, if a magistrate, justice of the peace, sheriff, or mayor reads a proclamation commanding a crowd of twelve or more persons to disperse, anyone refusing is liable to arrest and a term of imprisonment under this Act.

Rituale, the book of rites used in the Roman Catholic Church for the administration of certain sacraments and other church ceremonies. Like the Roman breviary, it dates in its present form from the Council of Trent.

Ritualists, the term used to designate an extreme High Church section of the Church of England, who brought into the ceremony of public worship coloured vestments, lighted candles, incense, and other features of Romanist worship, and excited much opposition and contention. A Ritual Commission was appointed in 1904 to receive evidence in regard to ceremonial excesses, and attempts have been made to arrive at a basis by which both High Church and Low Church adherents can agree upon the subject of ceremonial. The report of the Ritual Commission, published in 1906, concluded that the law of public worship in the Church of England had become too narrow for the present generation's religious life, and that the machinery for discipline had broken down. The Commissioners favoured the giving of greater power to Bishops for the suppression of objectionable practices.

Roach, a well-known small fresh-water fish of the carp family.

Roaring Forties, name applied to the prevailing westerly winds over the oceans in the temperate latitudes of the Southern Hemisphere.

Robin (or **Redbreast**). A small, very well-known bird with olive-brown upper parts and orange-red forehead, throat, and breast. Its wide European distribution includes the British Isles, where it is a common resident. It also occurs in N. Africa and W. Asia. The nest is placed in a great variety of situations including holes in banks, trees, and walls; in sheds, amongst ivy, and sometimes in old tins. Nesting-boxes are readily adopted, but care should be taken to ensure that the entrance-hole is small enough to exclude starlings. Robins are pugnacious and defend their territories with vigour. Their attractive appearance, trustful disposition, engaging ways, and sweet song make them extremely popular. The name robin is also applied to a number of very different birds, one of which, the American Robin, occasionally wanders to Europe.

Rock Dove, the grey pigeon *Columba livia* of Europe and Asia, ancestor of the domestic pigeons as Darwin was the first to show.

Rockets for use in war were invented by Sir William Congreve early in the 19th century, and proved very destructive in siege operations. Rockets were used as weapons by aircraft, infantry, etc. and the Germans devised the huge V2, carrying a ton of explosive, which was used near the end of the war to bombard London. Since the war rocket propulsion has been much developed. Instruments are carried to high altitudes by rockets to measure atmospheric pressure, density, temperature, and wind velocities and to study the properties of the ionosphere. A Soviet space rocket carrying scientific instruments hit the moon in Sept. 1959. British high-altitude rockets are *Black Knight* and *Skylark*. *See also* **F47**.

Rockoons, rockets raised to firing position in the upper atmosphere by large plastic balloons. During the International Geophysical Year rockoons were fired from the Arctic, Antarctic, and Equator to study geomagnetism and the aurora.

Rod, a measure of length equalling 5½ yd., also called a pole or a perch. 40 sq. rods equal 1 rood.

Roe, the parts of fishes which extend on each side of the ribs in lobes next to the intestines. "Hard roe" is that of the female and consists of eggs; that of the male is the soft roe or milt.

Roebuck, a deer that was formerly common in the forests and parks of Britain, but is now only found at large in the northern parts of Scotland.

Rogation Week begins with Rogation Sunday, the Sunday before Ascension Day, when extra prayers and supplications are offered as a preparation for the Ascension.

Rois Fainéants (King Do-Nothings), the last seven Frankish kings of the Merovingian dynasty, so-called because the officials known as Mayors of the Palace assumed all the power.

Roller, a tropical Old World bird of the *Coraciidæ*

family, allied to the hoopoe and bee-eater, of strikingly brilliant blue, chestnut, greenish-blue plumage. There are fifteen species, one of which breeds in the far north and visits the British Isles on its migrations to and from its winter quarters in Africa.

Roman Catholic Church is the Christian Church whose head is the bishop of Rome, lawful successor of St. Peter, who was appointed by Christ as head of the Church. Its Creed comprises twelve articles, the seven sacraments of Baptism, Confirmation, Eucharist, Penance, Extreme Unction, Orders, and Matrimony; the doctrines include those of Original Sin and Justification, sanctioned by the Council of Trent; the Mass, as a propitiatory sacrifice; Purgatory; Papal Supremacy, etc. It was the established Church of England until the Reformation, after which many disabilities were imposed upon Roman Catholics, and continued in a more or less severe form until the passing of the Emancipation Act of 1829. There are four Roman Catholic Archbishops in England (Westminster, Birmingham, Liverpool, and Cardiff), two in Scotland (St. Andrews and Edinburgh, and Glasgow), and four in Ireland (Armagh, Dublin, Cashel, and Tuam).

Romanesque Architecture, the style of Western European architecture which came into being at the end of the Roman Empire, the outcome of the earlier and simple Basilican form and leading to the later graceful and more complex Gothic. Notable in Romanesque style were the rounded arch and masonry vaulting. *See* **G34**.

Roman Roads, highways constructed by the Romans. They were of great durability. The best known British roads were Ermine Street (London, Lincoln, York), Fosse Way (Lincoln through Leicester, Cirencester, Bath, Exeter), Watling Street (London to Shropshire).

Roman Walls were built as frontier barriers under the Emperors Hadrian (76–138) and Antoninus Pius (86–161). Hadrian's works, linking Wallsend-on-Tyne with Bowness-on-Solway, comprised a twenty-foot stone wall, ditches, turrets, "milecastles," fortresses, and a double earthen mound, or "Vallum." Impressive ruins are still visible at Chesters and Housesteads. Antoninus Pius, Hadrian's successor, made a further advance, but the turf wall which he built between Forth and Clyde was soon abandoned. Septimius Severus (146–211) restored Hadrian's wall after the assassination of Commodus and the subsequent civil wars. It was finally abandoned between 380 and 390.

Rondo, a piece of music in which three distinct airs or melodies occur in a certain order. In the typical Rondo of Beethoven (*e.g.*, third movement of Sonata Pathétique) the order is 1, 2, 1 — 3 — 1, 2, 1.

Rood Screen, an ornamental partition, separating the choir from the nave in a church, and fronting the rood or crucifix.

Rook, a member of the crow family, abounding in most parts of the British Isles and found in Europe, Asia, and N. Africa. It has been introduced into New Zealand. Rooks usually nest in colonies in tall trees. They are highly intelligent birds, and their ways have long been the subject of much careful study.

Rorqual, a marine mammal of the whale order. There are several species. The Common Rorqual is a large animal, reaching a length of 80 ft. or more.

Rosary, a circular chain of beads, used by Catholics when reciting a particular form of sustained prayer. Each bead represents an entire prayer, and the combined prayers constitute the Rosary.

Roses, Wars of the (1455–85), between the rival houses of York and Lancaster, for the possession of the English crown, began in the reign of Henry VI. and ended with the death of Richard III. on Bosworth Field. The emblem or badge of the Lancastrians was the red rose and of the Yorkists the white rose. All rivalry between the Roses ended by the marriage of Henry VII., the Lancastrian, with the Princess Elizabeth, daughter of Edward IV., the Yorkist.

Rosetta Stone, discovered in 1799 by the French at Rosetta in Egypt, and deposited in the British Museum. It is a piece of black basalt about 3 ft. long, and contains a decree of the Egyptian priests of Ptolemy V. Epiphanes (205–181 B.C.) in (1) hieroglyphics, (2) demotic, and (3) Greek characters. It was by means of the three different inscriptions on the same stone that hieroglyphic writing was first able to be deciphered.

Rotten Row, a corruption of *route de roi* (king's drive), the famous riding resort in Hyde Park.

Rouge et Noir, a well-known gambling card game played on a table divided into two sections and marked with two black and two red lozenges. Any number of players can take part, and the money is staked on the red or black spaces. The cards are dealt out, first to Noir, until the pips aggregate more than 30; then in like manner to the Rouge, and the packet coming nearest to 31 wins the stakes.

Roulette, a gambling game played on a table carrying a revolving wheel divided into 37 compartments. Each compartment bears a number, 0 (zero) and 1 to 36. The numbers are mixed and do not follow any particular order. Of these 37 numbers 18 are black and 18 are red, whereas zero is green. The players stake their money on any compartment, colour, or combination of numbers they please. The wheel is whirled round and a ball is set rolling in the opposite direction, dropping finally into one of the compartments, thus deciding the winning number and colour.

Round, a musical composition in several parts, taken up by each participator at a different point from the other, and effecting a harmonious combination throughout. A Catch is similar in form, but usually allied to humorous words.

Roundhead. In the reign of Charles I. and later, a Puritan or member of the Parliamentary party who wore his hair cut short. It was originally a term of derision applied by the Royalists, who usually wore ringlets.

Round Towers are conical erections of considerable height, dating, probably, from some period between the 9th and 13th centuries. These buildings are numerous in Ireland, and three remain in Scotland. It is supposed they were built for ecclesiastical purposes, but there is no direct evidence of this existing.

Royal Academy of Arts was founded in London in 1768, under the patronage of George III. The early exhibitions of the Academy were held first in Pall Mall, and after in Somerset House, where the exhibitions continued to be held until 1836, when the National Gallery being built, the Academy moved its quarters to that building. In 1869 the present Royal Academy at Burlington House was opened. The Academy numbers 58 R.A.s and about 30 A.R.A.s. List of presidents: Sir Joshua Reynolds (1768), Benjamin West (1792), James Wyatt (1805), B. West (1806), Sir Thomas Lawrence (1820), Sir M. A. Shee (1830), Sir C. Eastlake (1850), Sir F. Grant (1866), Lord Leighton (1878), Sir J. E. Millais (1896), Sir E. J. Poynter (1896), Sir Aston Webb (1919), Sir F. Dicksee (1924), Sir William Llewellyn (1928), Sir E. Lutyens (1938), Sir A. J. Munnings (1944), Sir Gerald F. Kelly (1949), Sir A. E. Richardson (1954) and Sir Charles Wheeler (1957). The Academy holds an exhibition of pictures, statuary, and architectural designs every summer, to which non-members can, subject to selection, send their work.

Royal Academy of Music, founded in 1823, has enjoyed a Royal Charter since 1830, and an annual Government grant since 1868. Every form of music is taught there, as well as modern languages. It has valuable scholarships, and has produced many eminent musicians.

Royal Agricultural Society was founded in 1838 and incorporated in 1840. It holds an annual show, at which valuable prizes are offered for the best stock and the most important inventions in agricultural implements. These shows were held at different places each year from 1839 until London was fixed upon as what was hoped would be a permanent show place, and a large tract of ground was secured at Park Royal for that purpose. The shows held at the latter place, however, failed to attract the public, and a reversion was made to the old system in 1906.

Royal College of Music, at South Kensington, was incorporated in 1883. It has a large number of free scholarships for young musicians of outstanding merit. In association with the

Royal Academy of Music it holds annual examinations in several grades all over the country, awarding certificates of proficiency to successful candidates.

Royal Geographical Society, with headquarters in Kensington, supports geographical research in all parts of the world.

Royal Horticultural Society, established 1804; holds exhibitions in Vincent Square, Westminster, the annual flower display at Chelsea, and has gardens at Wisley in Surrey.

Royal Hospital, Chelsea, built by Wren, was opened in 1694 as an institution for invalid soldiers.

Royal Institution, established 1799, and incorporated by Royal Charter in 1800 for "the promotion, extension, and diffusion of Science and of Useful Knowledge." It was in the building of the Institution that Faraday conducted his experiments. It supports four professors: natural philosophy, astronomy, chemistry, and physiology. Famous also for its Christmas lectures designed for a juvenile audience.

Royal Society was founded by Royal Charter in 1662, Viscount Brouncker being the first president. Its *Philosophical Transactions* date from 1665. The meetings are held in Burlington House. Among the presidents have been Sir Christopher Wren, Pepys, Sir Isaac Newton, Sir Joseph Banks, Sir Humphry Davy, Prof. T. H. Huxley, Lord Rayleigh, Sir Archibald Geikie, Sir J. J. Thomson, O.M., Prof. Sir C. S. Sherrington, O.M., G.B.E., Lord Rutherford, O.M., Sir William Henry Bragg, O.M., Sir Henry Dale, O.M., Sir Robert Robinson, O.M., Lord Adrian, O.M., and Sir Cyril Hinshelwood, O.M.

Rubber, produced from the juice of certain trees and shrubs of tropical countries, is in such extensive demand now for tyres and other purposes that rubber plantations have been established in almost every part of the world where rubber can be grown, particularly in Malaya and Indonesia. The best kinds come from the Amazon valley. Great advances were made in the production of synthetic rubber during the second world war.

Rubicon, a small river falling into the Adriatic, and forming one of the Italian boundaries, the crossing of which anciently involved decisive action and constituted a declaration of war. Thus the phrase "crossing the Rubicon" came into general use, denoting an act from which there is no withdrawal.

Rubidium, a metallic element most closely resembling potassium. It is silver-white and very soft, and was discovered in 1861 by Bunsen and Kirchoff, using the spectroscope. It is rare, occurring in small amounts in the mica called lepidolite and in potash salts of the Strassfurt deposits in Germany.

Rubrics are instructions in regard to the ceremonies of the Church, appearing in red in the Prayer Book.

Ruby is a deep red kind of Corundum (aluminium oxide); one of the most valued of precious stones. Burma yields some of the finest, and rubies of inferior colour are found in Siam, Ceylon, South Africa, and Brazil.

Rudd, a fresh-water fish of wide distribution, plentiful in the rivers of Britain, and found in most other parts of Europe, also in Asia Minor. It is of a reddish-gold colour, with a greenish-blue beard.

Rudesheimer, a noted brand of white wine made from grapes grown in the district of Rudesheim on the right bank of the Rhine.

Ruff, a bird related to the common sandpiper, at one time very common in the Fen districts. The males have a ruff of feathers round the neck. The female is called the Reeve.

Ruffe *or* **Pope**, a small fresh-water fish common in most parts of central Europe, and similar in appearance to the ordinary perch. It is found in British rivers.

"**Rule, Britannia!**" the national sea-song of England, was written by James Thomson (1700–48), the author of the "Seasons," and set to music by Dr. Arne about 1740. The poet's words were "Britannia, rule the waves!" but it is usually rendered "Britannia rules the waves."

Rum, an ardent spirit distilled from molasses, and containing from 40 to 50 per cent. of alcohol. It is chiefly manufactured in the West Indies, and derives its special flavour from a volatile oil.

Rumes, the name given to a pleated strip of fine linen worn by men in the breast of the shirt, and fashionable down to the early part of the 19th century.

Ruminants, animals that chew the cud, being provided with a compartmented stomach, enabling them to swallow food, and later to bring it back to the mouth for mastication; *e.g.*, sheep, goats, oxen, etc.

Runcible spoon, a kind of fork used for pickles having three broad prongs. The word was used by Edward Lear about 1870 as a nonsense word and may be derived from *Rouncival* meaning large or huge from the bones said to have been dug up at *Roncesvalles* where Roland fell. Rouncival peas are the large peas called "marrowfats."

Runes *or* **Runic Inscriptions**, the description applied to certain characters discovered cut upon stone monuments and implements found in many parts of Europe, including England. In only a very few instances has it been possible to put any distinct and conclusive interpretation upon them.

Rural Dean, an ecclesiastical officer whose chief duty is to assist the Bishop in the duties of his diocese.

Ruskin College, Oxford, a unique institution founded by Mr. Walter Vrooman, an American, in 1899 to exist for all working men and women.

Rusts, parasitic fungi, some common species of which have reddish spores which in a mass have a rusty appearance. A well-known species is the Wheat Rust (*Puccinia graminis*), which has an alternative host in the barberry.

Ruthenium, a greyish-white metallic element discovered by Claus in 1845. It is harder and more brittle than platinum, in whose ores it occurs.

Rutile, mineral titanium dioxide. It is found in many igneous rocks, and in gneisses and schists. Its commonest colour is reddish-brown.

Rye House Plot, formed in 1683 with the object of assassinating Charles II. and the Duke of York (afterwards James II.), in order to secure the succession of the Duke of Monmouth. The plot was frustrated.

S

Sabaoth, a Hebrew word, meaning an army or host, and applied sometimes to the Supreme Being, *e.g.*, "the Lord of Hosts" (Rom. ix. 29)

Sabbath, the Bible name for the seventh day of the week, designated as the day of rest in the fourth commandment. It corresponds with Saturday in the modern calendar. The Christian "Sunday" is the first day of the week. It is nowhere in Scripture called the Sabbath though this name is sometimes erroneously applied to it.

Sabbatical Year was instituted by the Jews in ancient times for the purpose of giving the soil a rest from cultivation. This was every seventh year.

Sabines were a brave race inhabiting a territory near Rome in early times. The Sabines were absorbed in the Roman people about 290 B.C.

Sable, a furred mammal of the weasel family mainly inhabiting Siberia. It is bright brown in colour, and has a long, bushy tail. American sable is a marten.

Saccharin, a white crystalline solid manufactured from toluene, 550 times as sweet as cane sugar. It is used as a sweetening agent; as a substitute for sugar when sugar is forbidden, as in certain diseases, or when there is a shortage. It has no value as a food.

Saccharimeter, an instrument for determining the amount of sugar in solution by means of polarised light; also called a polarimeter. Used in sugar and jam factories (for control purposes).

Sack, the white dry wines of Spain and Madeira, canary being the most popular.

Sacrament, according to the Protestant Church includes Baptism and the Lord's Supper. In the Roman Catholic Church there are seven Sacraments. (*See also* **Roman Catholic Church**.)

Sacrilege is the breaking into a place of worship and stealing articles therefrom. In olden times this offence was punishable with death, but by Acts passed in the last century it was generally treated as an ordinary burglarious offence. By the Larceny Act, 1916, breaking and entering

any place of divine worship and committing a felony therein is punishable by penal servitude.

Saddles were used by the ancient Greeks and Romans, and were not known in England probably before the 6th century.

Sadducees, a Jewish sect of unbelievers, who held that the soul was mortal, and that there was no hereafter. Alluded to in the New Testament.

Safety Lamp, as used in coal mines, was invented by Sir Humphry Davy in 1816. The flame is enclosed in a cage of fine-meshed wire which allows air to enter and promote burning, but conducts away the heat generated in combustion so that no product of combustion escapes at a temperature high enough to ignite explosive gases in the mine.

Sagittarius *or* **"the Archer,"** one of the celestial constellations situated between Cygnus and Aquila. Sagittarius is another of the zodiacal constellations of 69 stars, which ancient astronomers worked into the representation of an archer. It lies between Scorpio and Capricornus.

Sainfoin, a widely cultivated forage plant, especially adapted for sheep. It is of strong, leafy growth and bears bright red flowers. It belongs to the same order of flowering plants as peas and beans.

St. Andrew's University, the earliest Scottish university (1412) and the third oldest in the United Kingdom.

St. Elmo's Fire, a glowing brush-like discharge of electricity which takes place from sharp-pointed objects on mountains or the masts of ships exposed to the intense electric fields of thunder-clouds.

Salamanders are amphibia superficially resembling lizards, from which they differ in having a moist skin and no scales.

Salic Law was probably instituted in France in the 5th century for the purpose of excluding females from inheriting the Crown. The Bourbons introduced the same law into Spain, but this was abolished by decree in 1830 to enable Isabella II. to succeed.

Salicylic Acid can be obtained from the flowers of the meadow-sweet, and from oil of wintergreen, but is now usually prepared by the action of carbon dioxide on sodium phenate under pressure. The acid is then prepared from the sodium salicylate. It is used as an antiseptic and has been used as a food preservative. Aspirin is a derivative of salicylic acid.

Salmon, a familiar fish notable for its habit of ascending rivers from the sea in the autumn and there depositing its spawn, not returning to the sea until the early spring. The salmon fishing season varies from place to place.

Saltpetre. (*See* **Nitre.**)

Salvarsan, the organic arsenical compound arsphenamine, which Ehrlich discovered was able to kill inside the human body the spirochæte germ that causes syphilis. Also known as "606." It has been superseded by neosalvarsan.

Sanctuaries were places where offenders against the law were free from arrest, and previous to 1697, when sanctuaries were suppressed, several parts of London were treated as sanctuaries. The chief of these refuge localities was in White-friars. There were others in the Minories, Mitre Court, the Savoy, Westminster, and the Mint. Other sanctuaries were at Beverley and at St. Burian's in Cornwall.

Sanderling, small wading bird of sandpiper family; breeds in tundra regions of far north, and is seen on sandy beaches of Britain as a winter visitor. Conspicuous white wing stripe and, like Curlew, Sandpiper, Knot, Dunlin, and other members of sandpiper family, has marked change of plumage between winter and summer.

Sandpiper, small- to medium-sized wading birds of several species whose migratory powers are so great that they are found in most parts of the world. They include the Common Sandpiper, frequently seen in Scotland, a bird about 7 in. long, greenish-brown head and back, white under-parts; beak long and slender. Other species met with in Britain are the Curlew, Green, Purple, and Wood Sandpipers.

Sanhedrin, the ancient Jewish Ecclesiastical Council of 70 members, said to have been originated by Moses when he called together 70 elders to assist him as judges. In modern times the Sanhedrin has been rarely summoned.

Sans-culottes, (French = without knee breeches), a term applied by the French aristocrats to the revolutionary leaders during the French Revolution who wore long trousers instead of knee breeches.

Sanskrit is the language of ancient India, spoken by the Brahmins, and existing in early Oriental literature. It was the language of literature and government and is now confined to temples and places of learning. Its relationship to the modern Indian languages is rather like that of Latin and Greek to modern European languages.

Saponin. The term is a generic one applied to a range of organic compounds which produce frothy, soapy solutions. Saponins are extracted from the soapwort root, horse chestnut seeds, etc. Saponin is the basis of the "foam" used for fire fighting; it can be used like soap to make insecticides and fungicides adhere to the leaves of plants.

Sapphic Verse, a form of verse said to have been invented by Sappho, the lyric poetess of Lesbos, who flourished about 600 B.C. *See* **G20.**

Sapphire, a valuable deep blue variety of Corundum (aluminium oxide) found mostly in India, Ceylon, and Northern Italy.

Saprophytes. A term applied to plants which feed on dead organic matter. Many fungi are saprophytes.

Saracen, the name given in classic times to the Arab tribes of Syria and adjacent territories. In the Middle Ages the current designation among the Christians for their Muslim enemies.

Sarcophagus, the name given to a stone coffin, such as was used by the ancient Egyptians, Greeks, and Romans, for receiving the remains of their famous dead. These sarcophagi were often decorated with rich carvings and sculptures.

Sardonyx, a kind of chalcedony comprising layers of alternating brown, red, white, and other colours. It is much esteemed as a gem.

Sarrusophone, bears the same relation to the Oboe as the Saxophone does to the Clarinet (*i.e.*, it has a metal tube and a double-reed mouthpiece). The Contrabass Sarrusophone is sometimes used instead of the Double Bassoon.

Sassanides were a dynasty of Persian rulers descended from Artaxerxes from 226 to 652.

Satellites are small planets revolving round the larger ones. The moon is the earth's only satellite. Jupiter has eleven; Saturn, nine; Uranus, four; Mars, two; and Neptune, one. A number of artificial earth satellites have been launched by America and Russia since Oct. 1957.

Satin-Bird, the famous "bower bird" of Australia, so named from its habit of constructing a bower-like nest; has a glossy black plumage, with the under parts yellow.

Satinwood, the timber of a tree plentiful in India and Ceylon, and valued for cabinet work. It is of fine grain and very hard. Varieties also exist in the West Indies, Florida, and Tasmania.

Satrap, the name given in ancient times to a Persian Governor of a Province.

Saturday, the seventh day of the week (the Jewish Sabbath), derived its name from Saturn, or, as some hold, is called after the Saxon idol, Saterne, which was worshipped on this day.

Saturn, a planet, the sixth from the sun, from which it is distant about 886 millions of miles, and around which it makes a revolution in about twenty-nine and a half years. It is about 71,500 miles in mean diameter, or nine times as large as the earth, and rotates on its axis in ten and a quarter hours. It is surrounded by a series of rings, meteoric in nature which revolve round the planet. It has nine small satellites.

Saturnalia, festivals held in ancient Rome in honour of the god Saturnus. They were made the scene of the most boisterous festivities, and were continued for several days at the end of December.

Savoy Palace, in London, between the Strand and the Thames, was originally built in the 13th century by Peter of Savoy. It was burnt in the Wat Tyler Rebellion in 1381, and afterwards restored and converted into a hospital in the reign of Henry VII. It was here that the famous but fruitless Savoy Conference was held between the Church and the Presbyterian Party in 1661. The ancient chapel of the Savoy was burnt down in 1864, but rebuilt in 1865.

Sawfish, a large marine ray found in tropical America and Guinea, whose snout often attains the length of several feet, and is provided with saw-like projections. This "saw" is swung from side to side among a shoal of fish which form the food of this ray.

Sawfly. These insects are considered to be the most primitive members of the order (*Hymenoptera*) to which the bees and wasps belong. In appearance they resemble somewhat the latter, but there is no waist separating thorax and abdomen. The ovipositor is never used as a sting; usually it is saw-like so that the female can use it to make incisions into tissues of plants where the eggs are laid. The larvæ look like caterpillars of butterflies and moths, but they have a great number of legs. One of the commonest species occurs on gooseberry bushes.

Saxhorns, large brass instruments on the cornet model invented by Sax. They are much used in military and other brass bands. The Tuba is the Bass Saxhorn in E flat or F. The Euphonium is the Bass Saxhorn in B Flat. The Contrabass Saxhorn in B flat (*i.e.*, one octave lower than the Euphonium) is called the Bombardon, but this term may be applied to the E flat Tuba.

Saxons, a Teutonic race originally inhabiting what is now Holstein. By the 7th century they had, with the Angles and Jutes, conquered and colonised most of England.

Saxophone, a musical instrument best described as a metal clarinet with a wide, curved tube. It is rarely used in serious music but is an important component of dance bands and the like. It is also used in military bands.

Scale (Musical), the series of notes on which a musical composition is built. Most European music is constructed upon the Major and Minor Diatonic Scales (*q.v.*).

Scald, the name of the Norse poets, who were similar to the bards of Wales. They had to celebrate the achievements of their warriors and leaders.

Scallop, marine bivalve molluscs of the genus *Pecten*, which is widely distributed. The scalloped edge to the shell results from a pattern of radiating grooves.

Scandium, an element classed in the rare-earth metals group. It was discovered in 1879 by Nilson, and occurs in small quantities in certain rarer minerals such as wolframite.

Scapular, a vestment hanging from the shoulder to the knees, worn by members of certain Roman Catholic orders. The name is also given to two small pieces of cloth worn over the shoulders by lay members of the Church in honour of the Virgin.

Scarabæus, a genus of beetles (Scarabs) widely distributed through Africa and Asia and the inner parts of Europe. It is to this genus that the "Sacred Beetle" of the Egyptians belongs, and numerous representations of it are found on ancient monuments.

Sceat, a small Anglo-Saxon coin, circulated in the 7th and 8th centuries, and worth nominally a penny; struck sometimes in silver.

Sceptics, a sect of philosophers founded by Pyrrho (*c.* 360–275 B.C.) in ancient Greece. Their philosophy was one of dogmatic doubt. Since nothing can be denied or affirmed, the only attitude to life is one of imperturbability. Pyrrho's doctrines are chiefly known through the works of his disciple Timon.

Sceptre, the staff or rod constituting the symbol of supreme authority. Tarquin, the elder, was the first Roman to assume the sceptre in 468 B.C. The French kings of the 5th century made a golden rod their sceptre.

Scherzo. The word signifies a *joke*. It is used to describe a piece of music in light or jocular vein. Beethoven used the Scherzo as a middle movement in a number of Symphonies and Sonatas, since when it has tended to displace the more formal minuet.

Schism, an ecclesiastical term for division in a church. The Great Schism was the separation of the Greek Church from the Latin, finally established in 1054. The Western Schism was the division in the Roman Catholic Church from 1378 to 1417, when there were two lines of popes, one at Rome and one at Avignon, which arose over the election of Urban VI. and Clement VII. to the papacy and was more a matter of persons and politics than a question of faith.

Schism Act was introduced in 1714 by Bolingbroke. It took away from Dissenters the education of their own children, which was to be handed over to persons licensed by bishops of the Established Church. The Act was repealed in 1719.

Schist, the geological name of certain metamorphic rocks composed for the most part of minerals with thin plate-like crystals (*e.g.*, mica) so that the layers of a schist are closely parallel. Quartz occurs in schists, and where it preponderates the term "quartz schist" is applied.

Schoolmen *or* **Scholastic Philosophers**, were a body who, in the Middle Ages, devoted themselves to the study and exposition of questions of religious inquiry, and attempted to reconcile the teaching of the Church with the dictates of human reason. The chief Schoolmen were Archbishop Anselm, Albertus Magnus, Thomas Aquinas, Peter Lombard, Duns Scotus.

Scorpion. The scorpions constitute an order of the arthropods. Distinctive features are the pair of powerful claws at the head and a "sting" at the tail, which curves over the back in attack or defence so that it points forwards. The poison injected by the sting is potent, causing instant death in spiders, centipedes, etc., and acute discomfort to humans. The idea that a cornered scorpion can sting itself to death is a myth; scorpions are immune to their own poison.

Scorpion Fly. The scorpion fly, of which there are less than 500 species, constitute a separate order of insects, the *Mecoptera*. They have 2 pairs of membranous wings, and gain their popular name because in some species the end of the abdomen is turned up, though it does not function as a sting.

Scotists were followers of the Schoolman, John Duns Scotus (1266–1308), who propounded certain moral laws and doctrines which were at variance with the teachings of the main body of Schoolmen, including Aquinas. (*See* Schoolmen.)

Scotland Yard, the Metropolitan Police Headquarters from which the Force is administered. The original Scotland Yard was a street near Trafalgar Square, so called because a palace stood there given by King Edgar (10th century) to Kenneth II. of Scotland. New Scotland Yard, the present official name for S.Y., is on the Thames Embankment, and the famous "C.I.D." (Criminal Investigation Dept.) has its headquarters there.

Scree *or* **Talus**, the mass of loose, angular rock fragments which accumulate towards the bottom of hill-sides and mountain-sides. These fragments have been detached by weathering processes, in particular frost action.

Scruple, an English apothecaries' weight, comprises 20 grains, or the third of a drachm. In ancient Rome a scruple was the 24th part of an ounce, and also indicated a surface and time measure.

Scutage *or* **Shield-money** was a feudal tax levied from Prelates and Barons in lieu of the military service of their knights enfeoffed upon their lands.

Scyphozoa. (*See* **Jelly Fish.**)

Scythians, a nomadic people of ancient times who inhabited much of Europe and Asiatic Russia. *See* **G6** (2).

Sea Anemones *or* **Actinaria**, an order of marine animals of the cœlenterate class *Anthozia*. They form a large and varied group of about 1,100 species and occur in many beautiful colours, flower-like in form.

Sea Butterfly, marine molluscs which propel themselves by two "wings," which represent lobes of the foot. They constitute the order called *Pteropoda*.

Sea Cow. (*See* **Manatee.**)

Sea Cucumbers *or* **Holothurians.** These animals constitute the class of echinoderms called *Holothuroidea*. They are elongated and worm-like, with a ring of about twenty tentacles round the mouth.

Sea Eagle, a genus of eagles, consisting of five species (more closely related to the kites than to true eagles), two of which occur in Europe. They live on fish and carrion and sometimes seek their prey among living animals.

Sea Elephant *or* **Elephant Seal**, a curious genus of seal, the males of which possess a proboscis a foot or more in length that suggests an elephant's trunk. They are found on the coast of California and in certain parts of the Southern Ocean; their blubber has a commercial value.

Sea Gravimeter, a new instrument to determine the density of the earth's crust beneath the oceans of the world. Designed by Dr. A. Graf of Munich and Dr. J. Lamar Worzel of Columbia University, it can detect changes of one-millionth of the value of gravity at the earth's surface and is being used in the oceanographical research programme of the I.G.Y.

Sea Hare, a genus of molluscs (*Aplysia*), so-called because of resemblance to a crouching hare. The shell is thin curved plate largely sunk in the animal's body. They have four tentacles, occur in Britain in the laminaria or ribbon-wrack zone, and discharge a purple fluid when molested.

Sea Horse, a sea-fish (*Hippocampus*), very numerous in the tropics and comprising some twenty species. Their bodies are ringed and they have prehensile tails. Their heads are horse-shaped, and they swim in a vertical position.

Sea Lily. A class of echinoderms, the sea lilies may be roughly described as "stalked starfishes." There are about 400 living species, and several thousand extinct species are known. Most of the former lose their stalk at maturity and are then free swimming. Otherwise called Crinoids.

Sea Mouse, a genus of marine worms called *Aphrodite*. These are of oval shape, some 8 or 9 in. long and iridescent. They are covered with fine bristles.

Sea Squirts *or* **Tunicates.** These animals are placed in the sub-phylum called *Urochorda*. They are found growing in rounded, jelly-like masses on rocks near low-water level. They get their name through the water jets they discharge.

Sea Urchin. The sea urchins belong to the class of echinoderms called *Echinoidea*. The body is globular and covered with spines which may be used for both defence and locomotion. The main organs of locomotion are, however, the tube feet, as in starfishes. Much has been learnt of recent years by marine biologists from experiments with the purple sea-urchin *Arbacia*.

Seals *or* **Signets**, have been in use from the remotest times. Some impressions of seals of Saxon kings are in the British Museum. The Great Seal of England was first used by Edward the Confessor, and is now used on the writs summoning Parliament, and for sealing all State documents of importance. The Lord Chancellor is the official custodian of the Seal.

Seasons comprise the four natural divisions of the year, and are due to the inclinations of the earth's axis to the plane of the elliptic. (*See* **Equinox.**) The spring season in Britain begins March 21. Autumn about Sept. 22. The summer and winter seasons are governed by the solstices (which see), and begin respectively about June 21 and Dec. 22. *See* **N20.**

Secondary Sexual Characters. Characters of animals which are distinctive of sex, but have no direct connection with the reproductive process. Examples are: the mane of the lion and the antlers of some deer.

Secretary Bird, so called because of the quill-like plumes about its ears, is a bird of prey related to the eagles and vultures; common in Africa, and of considerable service as an exterminator of snakes. It is a large bird about 4 ft. in height.

Sedan Chairs were first made at Sedan in France in the 16th century, and introduced into England in the reign of James I. They were in general use in the 18th century being borne on two side poles by a couple of bearers, and accommodating only one person.

Sedgmoor, Battle of, the deciding battle of the Monmouth Rebellion, fought July 6, 1685, at Sedgmoor in Somersetshire. The Duke of Monmouth was made captive, tried, and beheaded.

Sedimentary Rocks. *See* **F8** (2).

Seismology, the branch of geophysics devoted to the study of earthquakes and other earth movements. The instruments used for the registration of earth tremors are termed seismographs and consist in principle of a pendulum system, the supporting framework following the ground movement and the bob remaining at rest, thus setting up a relative movement between two parts. In order to record the displacements completely, at one station, three seismographs are necessary to show the two horizontal and the vertical components of the motion. Apart from detection and study of waves from earthquakes, sensitive seismographs are now widely used in geophysical prospecting, particularly in the search for possible oilfields.

Selenium, a non-metallic element of a dark red colour, and solid, found associated with sulphur, iron, pyrites, etc., though only in small quantities. Its electrical conductivity is increased when light falls on it, a phenomenon discovered in 1873 by May. Photo-electric cells depending on this property of selenium have been used for automatic control of street lamps that switch on at dusk and off at dawn, etc., but "selenium cells" have now been largely superseded by other photo-electric devices that are more reliable.

Semitic Languages are divided into two main sections; one including the Assyrian, Aramaic, Hebrew, and Phœnician groups; the other embracing the Arabic and the Ethiopian.

Semitone, the smallest interval in music—half a tone in the diatonic scale.

Senate, the higher governing Assembly of a Legislature. The word, applied primarily to the Roman council, is also used to denote the upper chamber in the legislatures of France, the United States, and other countries. In certain universities the governing body is also called the Senate.

Seneschal, a high official of a royal or noble household. The title originated in France in the 10th century, and was afterwards adopted in England and other parts of Europe.

Sensitive Plant. A species of Mimosa (*Mimosa pudica*), whose leaves are extremely sensitive to touch, shaking, and burning.

Separatists, the name given to the Dissenters in the time of Charles II., who pressed several severe measures against them. The term has also been applied to the Irish Home Rule Party.

Sephardim, the name of the descendants of those Jews of Spain and Portugal who left those countries in the 15th and 16th centuries to avoid the persecutions of the Inquisition.

Sepia, the "ink" of the cuttlefish. (*See* **Ink Sac.**)

September, the ninth month of the year, and the seventh of the old Roman calendar; hence the name, from Septimus. The designation was several times changed by the Emperors, but none of the new names survived for long.

Septembrists were participants in the massacre of prisoners in Paris in Sept. 1792 during the French Revolution.

Septet, a musical composition for seven voices or instruments.

Septuagesima Sunday, the third Sunday before Lent.

Septuagint, the Greek translation of the Old Testament.

Sequin, a gold coin of Italy, notably of Venice, which circulated from the 13th to the 18th centuries. It was worth about 9*s*. 3*d*. English.

Serfs, the name given to the slaves formerly existing in Russia, who answered to the condition of the feudal "villeins" of England. They were attached to the soil and were transferred with it in all sales or leases. Serfdom existed in Prussia until 1807 and in Russia until 1861.

Serjeants at Law, the highest degree of barrister rank formerly existing in England; until 1873 it was necessary for all Common Law Judges to be Serjeants before their elevation to the Bench. This qualification was abolished by the Judicature Act of that year. After 1873 appointments ceased and Lord Lindley (*d.* 1921) was the last of them.

Serpentine, a mineral; chemically a hydrous silicate of magnesium. Green serpentine is used as an ornament stone. Fibrous serpentine is called asbestos.

Serval, a small carnivorous animal of the lynx order, with black spots on a tawny ground. It is numerous in Africa, preys upon the smaller animals of the deer family, and is sometimes styled the "Tiger Cat."

Servitor. (*See* **Sizar.**)

Settlement, Act of, passed in 1701, assigned the Crown to the House of Hanover in case of Anne's death without children. The decision represented the determination of the squires and the Anglican Church never again to trust themselves to a Roman Catholic king.

Seven Champions of Christendom, as set forth in mediæval literature, were St. George of England, St. Andrew of Scotland, St. Patrick of Ireland, St. David of Wales, St. James of Spain, St. Denis of France, and St. Anthony of Italy.

Seven Churches of Asia, referred to in the Revelation of St. John, were those of Ephesus, founded by St. Paul in 57, Smyrna, Pergamos, Thyatira, Sardis, Philadelphia (Lydia), and Laodicea (Phrygia), all in W. Asia Minor.

Seven Sages *or* **Seven Wise Men of Greece,** regarded as the chief philosophers of the age before Socrates, were, according to the best authorities, Solon of Athens; Thales of Miletus; Pittaccus of Mitylene; Bias of Priene; Chilo of Sparta; Cleobulus of Lindus; and Periander of Corinth.

Seven Sleepers, of the ancient legend, took refuge from the wrath of the Emperor Decius in a mountain cavern, when they were made to sleep for 300 years.

Seventh-day Adventists, an evangelical Protestant denomination observing the divinely ordained seventh-day Sabbath of the fourth commandment rather than the first day of the week, for which there is no Biblical authority, and ardently looking for the second coming of Christ to right all earth's wrongs.

Seven Wonders of the World were: 1, the Pyramids of Egypt; 2, the tomb of Mausolus, King of Caria (hence the word mausoleum); 3, the Temple of Diana at Ephesus; 4, the Walls and Hanging Gardens of Babylon; 5, the Colossus at Rhodes; 6, the Ivory and Gold Statue of Jupiter Olympus; and 7, the Pharos, or Watch Tower, built at Alexandria by Ptolemy Philadelphus, King of Egypt.

Seven Years' War was waged by Frederick the Great and England against Austria, France, and Russia, from 1756 to 1763. It resulted in the secession of Silesia to Prussia, of Canada to England, and in the strengthening of our Indian Empire.

Sewing Machine, a machine for stitching cloth or other materials, and operated by manual, steam, or other power. Many attempts were made to produce such a machine between 1780 and 1840, but the first really practical invention of the kind was that of Elias Howe, an American, in 1841. Other sewing machines were afterwards introduced, and many improvements have been effected.

Sexagesima Sunday is the 2nd Sunday before Lent.

Sextant, an instrument which has superseded the quadrant as a measurer of angles between distant objects. It is of special importance in navigation and surveying, and contains 60 degrees described on a graduated arc. A small telescope is attached and there are also a couple of mirrors which reflect the distant objects so as to enable them to be accurately observed. The invention is attributed to John Hadley, and to Thomas Godfrey independently, about 1730.

Sextet, a musical composition for six voices or instruments.

Shad, a marine fish belonging to the same genus as the herring. It is found along the Atlantic Coast of the U.S.A., and ascends rivers to spawn.

Shagreen, shark's skin; also a leather of peculiar grain made from skins of wild asses, camels, horses, etc., and mostly manufactured in Astrakhan and Asia Minor.

Shake, a musical embellishment produced by the rapid alternation of two notes.

Shakers were originally an English sect who emigrated to America in 1772, and under the leadership of Ann Lee established themselves in a community at New Lebanon, in New York State. They practise celibacy and oral confession, hold goods in common, and reject baptism and the Lord's Supper. Dancing constitutes a part of their worship.

Shalloon, a kind of cloth manufactured from wool and worsted, and used chiefly for women's dresses and coat linings. It gets its name from the fact that it was originally made at Chalons.

Shamrock, the three-leaved clover-like plant native to Ireland and its national emblem.

Shark, a large and powerful ocean fish, comprising many species, very widely distributed, but most numerous in tropical seas. They have formidable teeth and are the most carnivorous of all fishes. They usually attain a large size, the whale-shark being often of a length of 50 ft. Commercially the shark yields shagreen from its skin, the fins are made into gelatine, and an oil is obtained from the liver.

Sharp. (*See* **Flat.**)

Sheep, a well-known family of ruminants of great utility as wool-producers, and for food. From the earliest times sheep have been a source of wealth to England. So much were they valued in the 15th and 16th centuries that their exportation was frequently prohibited. The chief English varieties are the Leicester, Cotswold, Southdown, and Cheviot breeds. Of the foreign breeds the most valued are the Merino sheep of Spain, which yield a fine long wool. Australia, U.S.S.R., Argentina, India, U.S.A., New Zealand, and S. Africa are the chief wool-producing countries in the world.

Sheldrake, a handsome genus of surface-feeding ducks, one of which, the common sheldrake, is an inhabitant of this country. It is a beautiful white-and-chestnut plumaged bird with dark-green head and neck and red bill. Another species, the ruddy sheldrake, appears in Britain only occasionally.

Shellac. This resin is the secretion of the lac insect (*Coccus lacca*), which occurs in forests of Assam and Siam. It is used for making varnish and in the manufacture of gramophone records.

Sherardizing. Process for coating steel or iron parts with zinc to prevent corrosion; this is done by heating the parts in a closed rotating drum containing zinc dust.

Shibboleth was the test word which Jephthah used to distinguish the Gileadites, his own men, from the Ephraimites as they passed the Jordan. Such as would not give the word were refused passage. The term is now frequently used to designate any special watchword or particular phrase.

Shield, a weapon of defence carried on the arm by soldiers before the invention of firearms, mostly made of metal, leather, or wood. In heraldry the term implies a shield-shaped escutcheon forming the ground on which arms are displayed.

Shilling has been an English coin from Saxon times, but is was not of the value of 12 pence until after the Conquest. The present style of shilling dates from the time of Henry VII.

Ships have existed from prehistoric times. There is mention of one that sailed from Egypt to Greece in 1485 B.C., and in 786 B.C. the Tyrians built a double-decked vessel. No double-decked ship was known in England, however, before the *Royal Harry* was built by Henry VII., and it was not until the 17th century that ship-building was carried on in this country as a prominent industry.

Ship-worm. (*See* **Teredo.**)

Shiva *or* **Siva,** the most worshipped god of the Hindu trinity.

Shoddy, the name given to a kind of cloth mainly composed of woollen or worsted rags, torn up and re-fabricated by powerful machinery. It was first made at Batley in Yorkshire about 1813, and became a very important industry employing many thousands of people at Batley and the neighbouring town of Dewsbury.

Short Parliament, that of Charles I. in 1640, lasting only three weeks.

Shot, the name given to solid projectiles fired from guns. In the time of Henry V. stone shot was used, later leaden shot, then iron shot, and finally steel shot, introduced by Sir Joseph Whitworth.

Shrike, a large and varied family of birds of hawk-like behaviour found in all continents except S. America. The Red-backed Shrike, which winters in Africa, is a breeding visitor to England and Wales. It is commonly called the "Butcher Bird" from the way it impales its prey (small birds and insects) on thorn-twigs. The other species on the British list are the Great Grey Shrike, the Lesser Grey Shrike, the Woodchat Shrike, and the Masked Shrike.

Shrove Tuesday, the day before the first day of Lent, receiving its name from the old custom of shriving, or making confession, on that day. In England the day has always been associated with the making of pancakes.

Sicilian Vespers, the term applied to the terrible massacre of French people in Sicily in 1282. The French under Charles of Anjou were then in occupation of the island, and had been guilty of many cruelties. It began at Palermo on Easter Monday at the hour of vespers and resulted in the expulsion of the French king and the introduction of Spanish rule.

Sikhs (disciples), a religious sect established in the 15th century, which gradually developed into a powerful race, and settled mainly in the Punjab. The sect was founded by Nanak (1469–1539) who preached simplicity, equality and rejected idolatory and caste. He was followed by ten *gurus* (spiritual leaders), the last of whom, Gobind Singh (1666–1708), welded the sect into a nation of warriors. They took the name of Singh (lion). After the death of Ranjit Singh in 1839 many fierce battles were fought against the British who finally subdued them and annexed the Punjab in 1849. They proved among the most loyal of Britain's Indian subjects. In the partition of India in 1947 their country was divided.

Silence, Tower of, or *dakhma*, a tower about 25 ft. high, built by the Parsees for their dead. The corpse is taken inside by professional corpse-bearers and left to be consumed by vultures. Parsees do not burn or bury their dead, and the *dakhma* is to protect the living and the elements from defilement.

Silhouette, a form of black profile portrait, invented by Etienne de Silhouette in 1759, and formed by an outline cutting made with scissors or other sharp instrument from cloth, paper, or other flat substance.

Silicon, an important non-metallic element. Next to oxygen, it is the most abundant constituent of the earth's crust (27% by weight). It occurs in many rocks, and its oxide occurs in many forms (*e.g.*, quartz, sand, flint, agate, chalcedony, opal, etc.).

Silicones are synthetic materials which because of their high resistance to heat and moisture have special uses, *e.g.*, as lubricants, heat-resistant resins and lacquers, and water-repellent finishes. Silicones are compounds in which the molecules consist of chains of atoms of silicon and oxygen alternately. Silicones were developed in the United States from discoveries first made by a British scientist. Manufacture began in Britain in 1950, and in the form of fluids, resins, rubbers, and greases they find wide use in industry. The largest plant in Europe is in Glamorgan.

Silk, the name given to a soft glossy fabric manufactured from the fine thread produced by the silkworm. It was known to, and highly prized by, the ancients, being at one time paid for, weight for weight, with gold. The manufacture of silk was carried on in Sicily in the 12th century, later spreading to Italy, Spain, and the south of France. It was not manufactured in England before 1604; but when certain French refugees established themselves at Spitalfields in 1688, the industry was developed and became of importance. In the 18th century the Lombes of Derby achieved great success in this industry. Japan, China, Italy, Korea, and the Soviet Union are the chief silk-producing countries.

Silkworm, the larva of a species of moth. It is native to China, and has been cultivated with success in India, Persia, Turkey, and Italy. The silkworm of commerce feeds on mulberry leaves and produces a cocoon of silk varying in colour from white to orange. The cocoon is the silken habitation constructed by the worm for its entrance upon the pupa condition, and to obtain the silk the pupa is killed by immersion in hot water.

Silures, an ancient British tribe occupying approximately the counties of Monmouth, Brecon, and Glamorgan. They resisted the Roman conquest fiercely, but were overcome by A.D. 78.

Silurian. This geological period is one of the major subdivisions of the Palæozoic era. Its beginning is estimated at 440 million years ago, and the period lasted about 40 million years. Maximum thickness of the Silurian strata in Britain measures 15,000 ft. *See* **F20**.

Silver, a white precious metal, found in a free state also in certain combinations, and in a variety of ores. The chief silver-producing regions are the Andes and Cordilleras. Peru, Bolivia, and Mexico have yielded vast supplies of the metal since the 16th century, and Colorado and Nevada in the United States have also been very prolific in silver yield. In England standard silver (that used for coinage) formerly contained 92½ per cent. fine silver and 7½ per cent. alloy, but when the price rose to 89½*d*. per oz. and the coins became worth more than face value, the Coinage Act of 1920 was passed, reducing the fineness to half. To provide silver bullion for industry and for a fund towards the redemption of our silver debt to America, it was decided in 1946 to replace the United Kingdom silver coinage by one made of cupro-nickel (75 per cent. copper, 25 per cent. nickel). Maundy money, however, is of the original silver standard.

Silverfish, a primitive wingless insect (*Lepisma*). About half an inch long, with two long antennæ in front and three similar feelers at the tail.

Simnel Conspiracy, occurred in 1486, when Richard Symonds, an Oxford priest, put forward Lambert Simnel, a baker's son, as heir to the throne. He was claimed to be Earl of Warwick, nephew of Edward Plantagenet. In 1487 Henry VII. defeated the rebels. Henry recognised that Simnel had been a tool in Yorkist hands and took him into his own service as a scullion.

Simonian, one who, like Simon Magus (Acts viii. 18), would purchase the gift of the Holy Ghost with money. A trafficker in spiritual things or Church benefices.

Simony, the offence of trading in church offices, has been contrary to English law since the time of Edward VI. Elizabeth also promulgated laws against simony. In 1879 a Royal Commission reported on the law and existing practice as to the sale, exchange, and resignation of benefices. The position is now controlled by the Benefices Act 1898, the Amendment Measure 1923, and the Benefices Rules 1926.

Sinn Fein (*Irish* = ourselves alone), an Irish nationalistic movement founded in 1905 which developed into a mass republican party and triumphed in the establishment of the Irish Free State. A small extremist group has survived which represents politically the outlawed I.R.A.

Sins, The Seven Deadly or **Capital Sins** are pride, avarice, lust, anger, gluttony, envy, sloth.

Sirius, the dog-star, so called because of its situation in the mouth of the Dog (Canis Major): it is the brightest of all the fixed stars, and is also one of the nearest to us.

Sirocco, a warm southerly, often dust-laden, wind blowing across Mediterranean lands from the Sahara, in advance of an eastward-moving depression over the Mediterranean.

Siskin, a small bird of the finch family, common in Northern regions which nests in Britain. The common Siskin has a yellow-green colour and is a lively, swift-flying bird with a very acute bill.

Sistine Chapel, the chapel of the Pope in the Vatican, renowned for its frescoes by Michelangelo.

Six Articles, The Statute of the, was passed in 1539 for compelling adhesion to the chief doctrines of faith; transubstantiation, communion in one kind, vows of chastity, celibacy, of the clergy, private masses, and auricular confession: those who refused to subscribe to the Articles were treated as heretics. The Act was repealed in 1547.

Sizar, a student of Cambridge or Dublin University to whom concessions in regard to college bills are made after having passed a certain examination. He formerly waited on the table, similar students at Oxford are called servitors.

Skate, a genus of sea-fishes related to the Rays.

Skink. The skinks constitute a large family of lizards with large smooth scales, under each of which is a bony plate. The largest species, found in Australia, is about 2 ft. long. Some skinks have adopted a burrowing habit and degeneration of the limbs is associated with this The Common Skink is a small species

about 5 in. long, living in the deserts of N. Africa and Syria.

Skua, falcon-like marine birds related to the gulls. There are five species. The Great Skua breeds as far south as the Shetlands. It is known as the "Robber Bird" because of its habit of pursuing terns, gannets, and gulls until these disgorge their food, which it then catches in mid-air. (This habit is common to all Skuas.) The Arctic Skua breeds as far south as the Scottish mainland. Other species are the Long-tailed Skua, the Pomatorhine Skua, and MacCormick's Skua, which breeds in the Antarctic and is the most southerly of birds.

Skunk, a North American mammal of the weasel family, with short legs and long bushy tail. All fifteen species are black and white, some being striped and the rest spotted. It secretes and ejects at will a foul-smelling fluid. Anything tainted with this fluid retains the odour for days.

Sky. The blue colour of the sky on a summer's day is the result of the scattering of light waves by particles of dust and vapour in the earth's atmosphere. Blue light having almost the smallest wavelength in the spectrum (0·00004 cm.) is scattered laterally about 10 times as much as the red (0·00007 cm.).

Skyscraper; owing to congestion, lack of ground space, and growth of modern cities, buildings are being made higher than broader; hence the name. The structures are constructed of a steel framework usually clothed in concrete or reinforced concrete. Among the highest examples are the Soviet Palace, Moscow (1,365 ft.), the Empire State Building of New York (1,250 ft.) and the Crane Building of Chicago (1,022 ft.).

Slate, fine-grained clayey rocks which have undergone metamorphosis. They cleave easily, and it is this property of cleavage which makes them a valuable source of roofing material. Welsh slates are among the best, there being important quarries at Penrhyn, Llanberis, and Ffestiniog.

Slavery, in its earlier forms, as in the times of the Romans, in the Feudal Ages, when vassalage and villeinage existed, and in the serfdom of Russia and other northern nations, was attended by many inhumanities and evils; but perhaps in the negro slavery system which prevailed in the British Colonies for upwards of 200 years and in certain parts of the United States up to 1865, it attained its highest point of cruelty. Since 1833 no form of slavery has existed within the British Empire. (*See also* **Serfs.**)

Slide Rule, an instrument which in its simplest form consists of two logarithmic scales sliding alongside each other. By its use multiplication, division, extraction of roots, etc., are speedily carried out.

Slings as a weapon of attack find prominent illustration in the Old Testament as the instrument with which David slew Goliath. There were bodies of slingers in the Carthaginian and Roman armies, and slings were used as late as the 17th century, when it was necessary to economise powder.

Sloop, a fore-and-aft rigged, one-masted vessel, carrying jib, fore-staysail, mainsail, and gaff-topsail. A sloop of war used to be a gun-carrying vessel of swift motion and great utility.

Sloth, a curious family of mammals, only found in Central and South America. They dwell almost entirely in the trees, proceeding from branch to branch with their bodies hanging downwards, their weight being supported by their large hook-like claws. They eat foliage.

Slow-Worm, a species of lizard found in Britain which lacks legs. Silver with longitudinal brown stripes, it lives almost entirely on slugs.

Smelting. The process of heating an ore with a reducing agent to convert ore into metal, and with a flux to convert rocky impurities into a slag that will float on top of the molten metal. Slag and metal can then be tapped separately. An example is iron smelting; the reducing agent is coke, and limestone is added as the flux; the smelting is carried out in a blast furnace.

Snake. The snakes constitute the important reptilian order *Ophidia*. Snakes have a scaly cylindrical body, without fore-limbs, and only in some instances possessing rudimentary hind-limbs. Their locomotion is accomplished by means of the excessive mobility of their ribs, which are very numerous. All snakes have teeth which only serve for seizing prey, and the poisonous varieties are furnished with poison fangs in the upper jaw. These fangs are hollow modified teeth and the venom passes into them from a special gland situated behind the angle of the mouth. Some 2,500 species of Snakes are known, divided into 11 families.

Snipe, a wading bird, long-legged, with long, slender, straight bill and brown plumage. The Common Snipe breeds on boggy moors in Scotland; the Great Snipe and small Jack Snipe are occasional visitors. The close season is Feb. 1 to Aug. 11.

Snort (*Ger.* Schnorchel), a tubular device of modern invention used in submarines. It contains two pipes for the intake of air and outlet of gases, and can be maintained above the level of the surface of the water. When a submarine is submerging with snort at the surface it is said to be *snorting*.

Snow. When water vapour condenses at high levels at a temperature below freezing, a cloud of ice particles is formed. If these frozen droplets are small, they fall slowly and gradually assume a feathery crystalline structure, reaching the earth as snowflakes if the temperature remains below freezing.

Socialism, a form of society in which men and women are not divided into opposing economic classes but live together under conditions of approximate social and economic equality, using in common the means that lie to their hands of promoting social welfare. The brotherhood of man inspires the aims of socialism in foreign, colonial, social, and economic policies alike. The British Labour Party believes in peaceful and constitutional change to socialism by democratic methods based upon popular consent.

The word "socialism" first came into general use in England about 1834 in connection with Robert Owen's "village of co-operation" at New Lanark. About the middle of the 19th century Charles Kingsley and others established a form of Christian socialism, and William Morris, John Burns, and others founded a Socialist League in 1886. With the development of Trade Unions the socialist movement took a more practical trend. Fabianism, associated in its early days with the names of Beatrice and Sidney Webb and George Bernard Shaw, aims at the gradual reorganisation of society by creating intelligent public opinion by education and legislation. The first time Labour Party members were returned to Parliament was in 1906, when 29 were elected; 393 members were returned to Parliament in 1945, 315 in 1950, 295 in 1951, 277 in 1955, and 258 in 1959 when the Party polled 12,216,166 votes (43·8% of the electorate). A democratic programme of planned economy and public ownership of certain vital industries and services were features of socialist government from 1945–51 together with a comprehensive system of social security.

Sociology is the study of society, but the science is so vast that sociologists differ in what they consider to be its subject-matter. One of the leading sociologists, however, Professor Ginsberg of London, lists the problems of the worker in this field as follows: (1) the investigation of the quantity of the population and its quality; the study of the various types of social structure and classification of social groups and institutions; (2) social control—the study of law, morals, religion, convention, and fashion—the regulating agencies of society; (3) social processes—study of the various types of interaction between individuals and groups—co-operation, conflict, etc.; (4) social pathology—the study of social maladjustment and disturbances. Sociology, like psychology, has been for long considered a field for arm-chair philosophy; most of the great philosophers from Plato and Aristotle onwards to Marx and Engels have produced theories on the nature of society, but such theories often tell more about the individual who composed them and his political prejudices than about facts. Recently, however, there are signs that sociology is becoming a science in its own right.

Soda, carbonate of soda, is now mainly obtained by certain processes of manufacture from common salt. It was formerly obtained from the ashes of plants. Bicarbonate of soda is the primary product in the Solvay or Ammonia-soda method for commercial manufacture of soda; it is also formed when carbon dioxide is passed into strong soda solution. The bicarbonate is used in medicine and in the preparation of baking powder.

Sodium, a metallic element first obtained by Sir Humphrey Davy in 1807 from caustic soda by means of the electric battery. Its chloride is *common salt*; the deposits of salt (*e.g.*, in Cheshire and at Stassfurt) have come into existence through the drying up of inland seas. Salt occurs in sea-water to the extent of about 3 per cent.; the Dead Sea contains about 22 per cent. The blood of animals is maintained at a level of about 0·6% sodium chloride. That there is sodium in the sun's atmosphere was confirmed in 1859 by Kirchhoff from his spectroscopic observations.

Soil, the upper portion of the crust of the earth, the medium from which all vegetation springs.

Solar System, general term embracing the sun, the planets and their satellites, and all celestial bodies which revolve round the sun. *See* **F7**.

Solstice, an astronomical term indicating the point at which the sun is most distant from the equator. *See* **N20**.

Somerset House, a large Government building stretching from the Strand to the Thames at the corner of Waterloo Bridge, and comprising the headquarters of the Inland Revenue and various other offices and registries. It was built towards the end of the 18th century on the site of an old palace which had belonged to the Protector Somerset.

Sonata. Properly the instrumental equivalent of a Cantata, *i.e.*, an extended piece for a solo instrument, *e.g.*, pianoforte or violin with pianoforte accompaniment. A typical sonata (*e.g.*, Beethoven's Pathétique, Op. 13) consists of three movements. Each movement (*see* **Movement**) consists of two or more subjects interwoven in a characteristic way. The first movement is longer than the others. A solemn introduction leads to an agitated first subject which is connected by a bridge to the second subject. This is followed by a small coda. This first part comprises the Exposition. There follows a short Development of themes found in the Exposition, this leading to a recapitulation of the first and second subjects, the latter with a change of key. The movement ends with a Coda consisting of themes from the Introduction and first subject. This treatment is typical of sonata form. The second movement is in complete contrast and is one of the loveliest slow movements ever written. Its form is that of a simplified Rondo. 1, 2, 1–3–1, Coda. The third movement is again in contrast. It is rapid but has not the tragic character of the first movement. The form is that of a full Rondo.

Sonnet, a favourite form of short poem in which Shakespeare, Milton, Wordsworth, and Keats especially excelled. *See* **M6** (1).

Sophists were the first Athenian teachers of philosophy in the 5th century B.C., who were supposed to base their reasoning on false premises, sacrificing much to mere quibble of rhetoric. They were denounced by Socrates. Plato and Aristotle also railed against the Sophists and the term "Sophism" has in later times been generally applied to fallacious arguments.

Soprano, a female treble (*see* **Treble**). The highest voice in a mixed choir.

Sorcerers were sufficiently numerous in the middle of the 16th century to have severe laws passed against them, and in 1603 James I. made it a capital offence to pretend to gifts of sorcery or witchcraft. The legal definition according to Lord Coke is, "a person who hath conference with the Devil to consult with him or to do some act."

Soundings at sea, to determine depth at any point, have been taken in all seas, and with considerable accuracy. A deep reading was that of the *Challenger* expedition in 1873, near St. Thomas's in the North Atlantic, when 3,875 fathoms were sounded. In 1851 H.M.S. *Challenger* recorded the then maximum ocean depth in the Marianas Trench (W. Pacific) by echo-sounding as between 5,882 and 5,940 fathoms. Another deep was located in the S. Pacific in 1952–53 of 5,814 fathoms in the Tonga Trench, 180 miles S. of Tonga Tabu. In 1957 an even greater depth was recorded, again in the Marianas Trench, of 5,993 fathoms.

Southern Cross, popular name of *Crux*, a constellation of the Southern hemisphere, consisting of four bright stars in the form of a Latin cross. It has been called the pole-star of the south and is indispensable to seafarers.

South Sea Bubble, a project entered upon in 1711 as a financial speculation by what was called the South Sea Company. Harley, Earl of Oxford, who was then in power, conceived the idea of utilising this project for getting together a sufficient sum to pay off the National Debt, then standing at about £51,300,000. The company contracted to redeem the whole debt in 26 years on condition that they were granted a monopoly of the South Sea trade. The idea fascinated the public, fabulous profits being dreamt of, and there was an immense demand for shares, which ran up in value from £100 to £1,000. All classes joined in the gamble, but by the wise policy of Sir Robert Walpole the fraud was exposed in 1720, when the whole scheme collapsed and thousands of people were ruined.

Sovereign, a British gold coin worth 20*s*. It was first coined in 1489, and remained the principal coin of the realm until its withdrawal in 1914. Its weight was fixed at 123·27447 grains troy, and it consists of 22 parts of pure gold to 2 parts of alloy.

Soviet. Russian word meaning "Council." The Russian revolution 1917 was based on workers' and soldiers' councils and they became the organs of the Soviet constitution.

Soya Bean. This is the bean of a leguminous plant (*Glycine soja*) found in Asia. The bean meal, which is rich in protein and oil, is familiar in Britain as "soya flour."

Spanish Civil War, 1936 to 1939. The war commenced by a revolt by the Fascist General Franco against the Republic which had succeeded the Monarchy in 1931. Germany and Italy aided the rebels who besieged Madrid for over 2 years. An International Brigade was formed to help the Republic, but the Spanish Government was faced by the greater part of the Army, and very effective assistance from Italy and Germany. Those powers seized the opportunity to have a curtain-raiser to the world conflict which they intended to precipitate. After a total loss of a million men the Fascists overpowered the Republic.

Sparrow, name given to finch-like birds found in most parts of the world, of which the House Sparrow, *Passer domesticus*, is the most familiar of British birds. Also native to Britain is the rural Tree Sparrow, distinguished by its chestnut crown. Other European species are the Italian, Spanish and Rock Sparrows.

Speaker of the House of Commons, an official who presides over the deliberations of the Lower House of Parliament, and acts as guardian of its privileges. He is elected by his fellow-members, subject to the approval of the Crown, at the beginning of each new parliament, though it is customary for him to serve successive parliaments. The name of a Speaker (Sir Thomas Hungerford) is first recorded in the Rolls of Parliament for Jan. 1377. *See* **C7** (1).

Specific Gravity, defined as the ratio of the mass of a particular volume of a substance to the mass of an equal volume of water at 4° C. (*See* **Hydrometer**.)

"**Spectator.**" Addison's famous periodical publication was first issued on Mar. 1, 1711, the last issue being Dec. 20, 1714. The bulk of papers were contributed by Addison and Steele.

Spectroscope, an instrument for spectrum analysis or observation. It consists of a tube through which the light, in whose spectrum the observer is interested, is conveyed to a collimating lens, which focuses it on to a prism, and a telescope through which to view the spectrum. The first flame spectrometer was constructed by Kirchhoff in 1859.

Spectrum. When light is refracted by a prism the rays of different wave-length are refracted

slightly differently. Thus white light is broken down to give its spectrum colours, ranging from red (longest wave-length) to violet (shortest wave-length). This phenomenon was discovered by Newton in 1672.

Spermatozoa, microscopic cells about $\frac{1}{500}$ in. long which are the generative element in male animals, and possess the power of fertilising the female ovum. In shape they resemble a tadpole, their mobility deriving from the long tail each spermatozoon has.

Sphinx, in Greek mythology a winged creature with a woman's head and a lion's body. The figure of Egyptian religion, which probably originated in Mesopotamia, represented a king in divine form. The Great Sphinx at Giza, probably built in the reign of Chephren (c. 2900 B.C.) is in the form of a lion with the head of a pharaoh.

Spiders were formerly classed as insects, but are now included with the animals of the *Arachnidæ* class. They have eight legs, breathe through pulmonary sacs, have six to eight eyes, and in most species spin webs composed of a viscid fluid.

Spinet, a sort of boudoir harpsichord popular in the 17th century. The name derives from that of its inventor, Spinetti.

Spirituals, negro melodies with religious inspiration and which are still spontaneously created, but have also passed into art-music. Paul Robeson, the American Negro, is the best-known singer of spirituals to-day.

Sponge, a marine organism consisting of a colony of cells, each of which slightly resembles an amœba. While the sponge lives a current of water circulates through the main apertures. It is the dead skeleton of this mass that forms the sponge of commerce. *See* **F24** (1).

Spoonbill, a long-legged marsh bird, closely related to the ibis and stork, remarkable for its snow-white plumage and broad, flat, spoon-shaped bill. The European species has not bred in England since the beginning of the 17th century, but is still a regular summer visitor from Holland, where it nests in colonies in reed-beds and islets.

Sprat, a sea-fish of the herring order, plentiful on all European coasts. It averages from 3 to 4 in. in length. It frequently does duty for the preparation of "anchovy" paste, as its fry does for whitebait.

Spurs have been used by horse riders from ancient times; in the feudal period a knight was allowed to wear gilt spurs, an esquire silver ones.

Sputniks, the name of the Russian earth satellites first launched during the period of the International Geophysical Year. *Sputnik I*, launched 4 Oct. 1957, became the first man made earth satellite. *Sputnik II*, launched a month later, carried a dog as passenger. *Sputnik III*, launched in May 1958, and weighing well over 2 tons, became the first fully-equipped laboratory to operate in the heavens. The sputniks represent a highly significant landmark in the history of scientific research. The father of space travel with rockets was a Russian—Konstantin Eduardovich Tsiolkovsky—the centenary of whose birth practically coincided with the launching of the first earth satellite. *See also* **F47–49**.

Stainless Steel. The development of stainless steel for cutlery manufacture, etc., began with the discovery of Harry Brearsley in 1912 that steel containing 12 per cent. of chromium is rust-proof.

Stalactites are calcium deposits formed on the roofs and sides of limestone caves, and in tunnels, under bridges, and other places where the carbonic acid of rain-water percolates through and partly dissolves the limestone, resulting in the growth of icicle-like forms that often assume groupings. The water that drops from these and rests upon the ground is called *stalagmite*, which accumulates and hardens into a series of sharp mounds or hillocks.

Stamp Duty, a tax imposed in Great Britain on written documents which are evidence of legal rights involved. The payment of the tax is denoted by a stamp which is impressed on or affixed to the document. The Stamp Act of 1891 is still the principal Act governing stamp duties, though most were doubled under the Finance Act, 1947, and many were abolished altogether under the Finance Act, 1949.

Standarding is an arithmetical calculation for ascertaining the value of bullion, that is, converting the gross weight of gold or silver that is not of the standard into its equivalent in weight of standard metal.

Starch is an organic compound occurring in granules in nearly all green plants, and especially in the seeds of dicotyledonous and cereal plants, potatoes, etc. In its pure form starch is a tasteless, odourless white powder, and is a carbohydrate consisting of carbon, hydrogen, and oxygen.

Star Chamber, an ancient tribunal of State in existence in 1486 and possibly earlier, charged with the duty of trying offences against the Government, unfettered by the ordinary rules of law. It was in effect a Privy Council entrusted with judicial functions, and the present Judicial Committee of the Privy Council to some extent represents the older tribunal. Under Charles I. the Star Chamber was used by the King and his party in the most unjust manner to persecute their opponents, and became such a scandal that in 1641 it had to be abolished. (*See* **Privy Council**.)

Starling (*Sturnus vulgaris*), a well-known European bird now common in many parts of the world. It has handsome plumage, shot with greens and purples and nests in holes and crevices. Flocks of starlings are often seen wheeling in the air, thousands roost on buildings in the heart of London. Other European species are the Spotless and Rose-coloured starlings. The latter sometimes wanders to the British Isles.

States-General, national assembly in which the chief estates of the realm were represented as separate bodies. The name, though not the institution, has survived in the Netherlands, where the two houses of parliament are known as states-general. In France the states-general consisted of three orders, clergy, nobility, and commons. Philip IV. first summoned it in 1302 to support him in his quarrel with Pope Boniface VIII. While absolute monarchy was establishing itself it met rarely, and not at all from 1614 until 1789, when it was convoked as a last resort by Louis XVI. But when it met it declared itself the National Assembly which marked the beginning of the revolution.

Statute of Westminster, 1931. An Act of parliament which gave a basis of equality to the British Dominions. The Dominions as well as the United Kingdom were defined by the Balfour Memorandum of 1926 as "autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations." The Statute was the sequel. The Dominions are sovereign States governed solely by their own Parliaments and Governments. They have separate diplomatic representation and the right to secede from any international organisation and from the Empire.

Steam Engine, a machine whereby steam becomes the active agent of the working of machinery, and of very wide application. The leading types of steam engine are: (*a*) condensing, or low-pressure engines, where the steam is generated by a boiler; (*b*) non-condensing, in which the cylinder exhausts its steam into the open air. Engines of the latter type are used where portable engines are required *See also* **F40** (2).

Steam Hammer, invented by the French engineer Bourdon and James Nasmyth in 1839, which proved of great utility in the development of the iron trade. The hammer itself, which is fixed to the end of a piston-rod passing through the bottom of an inverted cylinder, often weighs as much as 80 or 100 tons, and is so perfectly controlled by the steam power that its action can be so accurately gauged that it could be made to crack the glass of a watch without actually breaking it, or brought down upon a mass of molten iron with a force representing many hundreds of tons.

Stearin is the portion of fatty matters and oils which remains solid at an ordinary temperature, and is a compound of stearic acid with glycerine. It is largely used in the manufacture of candles

and for other commercial purposes. With caustic soda stearin forms a soap (sodium stearate), which is present in most commercial soaps which contain sodium palmitate and oleate in addition.

Steel, an alloy of iron and carbon; has been in general use from the earliest times, but how and where first manufactured remains a mystery. There are many varieties of steel, and these can contain manganese, silicon, copper, phosphorus, and sulphur. Other important alloying elements are nickel, chromium, molybdenum, tungsten, and vanadium. The oldest method, and one now generally adopted for the manufacture of steel, is that known as the "cementation or crucible process," but the most important method of all was introduced by Sir Henry Bessemer in 1855. This is known as the "Bessemer process," which consists in first burning all the carbon out of pig iron, and then putting back into it a sufficient quantity of carbon to produce steel containing the required proportion of this element. The metal produced by this process is called "Bessemer steel," which is of the highest value for structural purposes, rails, etc. For the manufacture of tools and weapons steel is indispensable. The United States, Germany, U.S.S.R., and United Kingdom are the leading countries in the world in steel production. (*See also* **Stainless Steel.**)

Stellite, an important alloy for the manufacture of cutting tools. It contains chromium, cobalt, usually some tungsten, and a small quantity of carbon.

Stencil, a wax sheet or metal plate, on which is cut a pattern or set of words. By placing the stencil on a sheet of paper or other substance and applying ink or paint to the cut-out pattern a copy of the pattern is obtained on the paper. Modern business practice has proved the usefulness of stencils. Cut on wax sheets by a typewriter a good stencil can produce as many as 100 copies or duplicates.

Stenography, the art of shorthand writing, was practised by the ancients, but was not in use in England before the 16th century. The systems invented in the 18th century were numerous, but the one that was most widely adopted was that of Mason, as improved by Gurney. In 1837 Pitman's phonographic system was first announced, which was a decided advance on any previous system, establishing a simple series of phonetic signs that was easily learned and admitted of great abbreviation. The average speed is 120 words a minute. This is the system in general use to-day. Its inventor received the honour of knighthood.

Stereotype, a metal cast taken from movable type which has been set up in the ordinary way. The first to introduce the process in practical form in this country was William Ged, of Edinburgh, who made stereotype plates in 1730. An impression of the type matter is first taken by means of a mould of prepared plaster of Paris or moistened sheets of specially prepared paper, and when molten stereo metal is poured upon the mould and allowed to cool and harden, the stereo plate is formed, and can be printed from as a solid block for some time.

Stethoscope, an instrument by which the action of the heart and other organs of the chest can be heard and gauged. It was invented by Laënnec, of Paris, in 1816, and consists of a cylinder, one end having a funnel-shaped opening which is placed against the chest, while the other end is held to the listener's ear. There is also a binaural stethoscope, which has two india-rubber tubes for the ears.

Stibnite, the chief ore of antimony; chemically it is antimony sulphide. Steely-grey in colour.

Stirrup, a loop of metal U-shaped strap suspended from the sides of the saddle, used for mounting and to support the horseman's foot. Some authorities allege their use as far back as the early Iron Age, and it is generally believed that they were used in battle in A.D. 378, when the Gothic cavalry defeated the legionaries of the Emperor Valens at Adrianople. Stirrups relieved the tension on the rider's knees and so enabled him to be armed from top to toe.

Stoat, a slender carnivorous mammal with short legs, related to the weasels. The stoat is distinguished from the latter by its longer tail, which has a black tip. The black tip is retained even in the winter when the animal turns white, the fur then being known as "ermine."

Stoics were the followers of Zeno, a Greek philosopher of the 4th century B.C. They received their name from the fact that they were taught in the Stoa Poikile, or Painted Porch, of Athens. Zeno's doctrine was that since the world is the work of divine wisdom and is governed by divine law, it is man's duty to conform freely to whatever destiny may be his. Zeno's doctrines developed into a great system of metaphysics with schools at Athens, Rhodes, and Alexandria and became the favourite philosophy of the Romans with its emphasis on correct conduct and duty and contempt for science.

Stole, ecclesiastical vestment worn by priests over both shoulders and by deacons over the left shoulder only.

Stoma, the term for the microscopic pores on the surfaces of leaves. The plural of "stoma" is "stomata." It has been estimated, for example, that a single maize plant bears 200 million stomata, which are usually closed at night.

Stone-Flies, comprise the order of insects called *Plecoptera*, which includes some 700 species, of which about thirty occur in Britain. The wings are membranous, and two long, thread-like feelers protrude at the tail end. The larvæ are aquatic.

Stonehenge, a remarkable collection of Bronze Age monuments arranged in two circles, 340 ft. in diameter, standing on Salisbury Plain, Wiltshire. Modern archæological research dates origin back to between 1860 and 1500 B.C. The fallen trilothon and stones of the outer circle were re-erected in 1958.

Stool of Repentance, a seat placed near the pulpit in Scottish churches in former times, on which persons guilty of moral lapse were ordered to sit in expiation during service.

Stork, a family of heron-like birds with long bills, freely distributed over Europe, Asia, Africa, and S. America. The White Stork is an occasional visitor to England, and, more rarely, the Black Stork; these are the only two European storks.

Storting, the Norwegian legislative assembly, is composed of two chambers; the odelsting, which originates Bills, and the lagting, which has the power to approve or reject Bills, but not to amend them.

Stratosphere, a layer of the earth's atmosphere, which begins 6–7 miles above the earth. The attraction of the stratosphere as a medium for air travel rests upon the absence of storms; indeed weather phenomena as commonly understood do not occur, there being no vertical temperature gradient in the stratosphere and no convection currents.

Strings. A collective term for those instruments in an orchestra which are played by drawing a bow across stretched strings, *e.g.*, violin, viola, violoncello, double bass.

Strontium. This silver-white metallic element was discovered by Hope and Klaproth in 1793, and isolated by Sir Humphry Davy in 1808. The chief strontium minerals are celestite (sulphate) and strontianite (carbonate). Compounds of strontium give a brilliant colour to fireworks and signal flares. Radioactive isotopes of strontium (strontium-90) are formed as fission products in nuclear explosions which tend to collect in bone. This genetic hazard is a cause of great alarm.

Stucco, a mixture composed of plaster of Paris and a solution of glue, much used in architectural decoration. It was known to the ancients and freely utilised in Italy in the 16th century.

Study, a piece of music written primarily as a practice-piece for perfecting technique. Many of the Studies (Etudes) of Chopin have considerable merit as music.

Sturgeon, a large fish found in northern seas and rivers with five rows of bony plates along the back and sides and pointed mouth with four barbels. Caviare is prepared from Sturgeon ova. Since the reign of Edward II. all sturgeon caught off the coasts of Britain, except in certain privileged places, have belonged to the Sovereign.

Sublimation, when a solid substance is heated and

turns into vapour without passing through the liquid stage, it is said to "sublime" and the process is called "sublimation." Iodine behaves in this way, and sublimation is used as a method of purifying it.

Submarine, the first submarine, the *Nautilus*, was designed by Robert Fulton and tried out in the river Seine and in the sea off Brest in 1801. The idea was too revolutionary to find acceptance and it was not until electricity for under-water propulsion became available that the submarine underwent extensive development. Britain became interested about 1900 and the Germans developed it and made it into an instrument of warfare. The first voyage under the North Pole was made in 1958 by the American nuclear-powered submarine *Nautilus*.

Subpœna, "under a penalty," a writ of Court commanding the attendance of a witness at a specified time and place. It is called a *subpœna ad testificandum* when requiring verbal testimony only, and a *subpœna tecum* when requiring the production of documents.

Succession, Acts of, have been passed at various periods to secure royal descent in a particular line. That under which our present dynasty reigns, and which established the Protestant Succession, was passed in 1689.

Suez Canal, connecting the Mediterranean and the Red Sea, was built by the French engineer Ferdinand de Lesseps and opened in 1869. An Egyptian company, *Canal Maritime de Suez*, was formed in 1866 with a capital of 200 million francs. The British Government acquired 176,602 shares out of a total of 400,000 for £4 million (value Mar. 31, 1956, £28,982,544). Its length is 101 statute miles, minimum width 196 ft. 10 in. (navigation channel), and the maximum draught of water allowed for vessels using the canal is 34 ft. The average time for transit through the canal is eleven hours seventeen minutes. Under the Convention of 1888 all nations were granted freedom of navigation without discrimination in peace or war. The right was recognised by Egypt in the Anglo-Egyptian Agreement of 1954, under which Britain agreed to give up the Suez base. The Suez Canal Company was nationalised by the Egyptian Government without warning on July 28, 1956.

Suffragette, member of the Women's Suffrage Movement who in the early part of this century agitated to obtain the parliamentary vote. The movement ended in 1918, when women of 30 were given the vote. In 1928 a Bill was passed which granted equal suffrage to men and women. The leaders of the Women's Suffrage Movement were Mrs. Pankhurst and her two daughters, Sylvia and Dame Christabel, Mrs. Fawcett, Nellie Kenny, and others.

Sugar, to the chemist the term is a generic one covering a group of carbohydrates, including cane sugar (sucrose), glucose, fructose, and maltose. In ordinary parlance sugar means sucrose, which is obtained from the sugar cane, sugar beet, or sugar maple.

Sulphur, an elementary brittle crystalline solid abounding in the vicinity of volcanoes. It is yellow in colour. It occurs in combination with other elements, as sulphates and sulphides, and allied with oxygen, hydrogen, chlorine, etc., is of great commercial utility. Used in its pure state it constitutes the inflammable element in gunpowder; it is also used for matches.

Sulphuric Acid, a compound of great commercial importance, used in a variety of manufactures, and composed of sulphur, oxygen, and hydrogen.

Sultan, the title of the Turkish Ruler which was first held by Osman in 1299. The last of the Sultans, Mohammed VI., escaped to Malta in Nov. 1922, and on Oct. 29, 1923, Turkey was declared a republic by the National Assembly.

Summer Time. In 1916 an Act was passed advancing Greenwich Mean Time by one hour during the summer months, calculated to save light and fuel by making use of an extra hour of daylight. This Act was made permanent in 1925, and summer time was to begin on the day following the third Saturday in April, or if that day was Easter Sunday, the day following the second Saturday, and end on the day following the first Saturday in Oct. By the Summer Time Act, 1947, the periods of summer time are now fixed each year by Order in Council.

Sumptuary Laws. Both the Greeks and Romans passed laws against luxury. In England regulations against luxury in food were promulgated under Edward II. and subsequently. A series of Acts of Parliament, beginning in 1363, placed restrictions on apparel, graduated according to rank. In 1603, most of these laws, which had already fallen into abeyance, were repealed.

Sun, one of the millions of stars in the universe, the centre of the solar system, estimated to be distant from the earth 93,004,000 miles, to have a diameter of 865,000 miles, and a volume a million times that of the earth. It rotates on its axis from east to west, though not as a solid, the solar equator turning once in about 25¼ days and the poles in about 34 days. Large spots are observed on the sun—varying in size from 30,000 miles in diameter—which form and disappear at irregular intervals. The area of the disc covered by the spots, however, reaches a maximum roughly every 11 years, when the sun's heat seems rather greater than usual and magnetic storms more frequent. Spectrum analysis show that the sun is composed of many elements found in the earth. Its surface temperature is about 6,000° C. The apparently inexhaustible heat of the sun, which has maintained life on the earth for millions of years, is derived from the destruction of matter, involved in the transmutation of hydrogen nuclei into helium nuclei, in which process about four million tons of matter is destroyed every second. At this rate of conversion the sun will go on radiating for 30,000 million years. The Soviet space rocket *Lunik I*, fired on 2 Jan. 1959, became the first artificial planet of the sun. *See also* **F7**.

Sunday, the first day of the week. In ancient times it was the day on which the sun was worshipped. In the early days of the Church Christians began to observe the first day of the week in honour of the resurrection in addition to keeping the seventh-day Sabbath of the Decalogue. Gradually the seventh-day Sabbath was abandoned and the first day adopted, though without any Biblical authority, as the Christian rest day. The first Sunday law was that of Constantine the Great in A.D. 321, in which it was decreed that all should rest from their labours upon the "venerable day of the sun."

Surface Tension. The surfaces of fluids (*e.g.*, a drop of water) behave as though they were covered by a stretched elastic membrane. This property is called "surface tension."

Surtax is payable in addition to income tax on all incomes exceeding £2,000 (after deduction of certain allowances), the rate increasing from 2*s.* in the £ with the size of the income.

Suttee, the practice prevalent in parts of India, until specially prohibited by a law of 1829, of self-burning of widows on their husband's pyre, the idea being, according to the religion of Brahma, that widows thus immolated passed direct to heaven.

Swans, large, graceful birds which together with the ducks and geese form the family Anatidæ. There are three European species with white plumage; the Mute Swan, distinguished by its orange bill with black knob, being the best known and a familiar sight on the rivers and ornamental lakes of this country. Two wild swans are winter visitors here, the Whooper and Bewick's Swan. The "pen" (female) and "cob" (male) mate for life and the young swans are called "cygnets."

Swan-upping. The annual marketing of the Thames swans which takes place during the third week of July. This ancient ceremony dates back to the 15th century when all the Thames swans were declared to be Royal birds owned by the Crown. Two city guilds—the Vintners' and Dyers' Companies—own one third of the 600 swans now on the Thames. This privilege was granted to them by King Edward IV. in return for money grants. Vintners' birds are marked with a nick on each side of the bill, the Dyers' with a nick on the right side only. The Queen's birds are unmarked.

Sweet Potato. This plant (*Ipomoea batatas*), which is a climbing perennial belonging to the convolvulus family, has thick roots that are

rich in starch, and are eaten like potatoes. A native of the W. Indies and Central America, new varieties of sweet potato have been bred which stand cooler climates and can be grown as far north as Cape Cod. The sweet potato of New Zealand is called the Kumara.

Swift, a bird so-called from the extreme speed of its flight, resembling a swallow but related to the humming-bird. It has long scythe-like wings, sooty-black plumage and greyish-white chin. There are several species inhabiting most parts of the world, particularly the tropics. The British breeding bird is among the latest to return from Africa and the earliest to go. Swifts are the only birds to use saliva for their nests. One oriental species builds its nest entirely from saliva, and this jelly-like substance is much prized by the Chinese for their birds'-nest soup.

Swords, from 20 to 30 in. long, were used by the Romans. The most famous swords of the Middle Ages were those made of Damascus and Ferrara steel.

Symbiosis. When two organisms live together and both derive mutual benefit from the association, the partnership is known as symbiosis. An example is the symbiosis of an alga and a fungus in lichens; another is the ordinary pea plant and the bacteria which live in the nodules on the pea's roots.

Symphony, a "sonata for full orchestra," usually consisting of four movements. In Beethoven's Third Symphony the first movement is in typical sonata form, consisting of an exposition of two subjects followed by a development. The second movement is a funeral march on a ternary plan (*i.e.*, 1–2–1). The third movement is a Scherzo on two subjects, while the fourth movement is an air with variations.

Syncopation, a displacement of the accent in music. For instance, in four-beat time the accent is normally on the first beat. If it were on any of the other beats the music would be syncopated. This device has occasionally been used in classical music, but it is the very essence of jazz.

Syndicalism, a labour movement which demands that industries shall be controlled by those who work them.

Synods, assemblies of heads or representatives of state and ecclesiastics for settling disputes relating to Church authority and government. (*See also* Œcumenical Council.)

Synoptic Charts. These are meteorological charts on which a synopsis of observed weather conditions is recorded using symbols of the international weather code.

T

Tabard, a cloak or outer garment worn in mediæval days by the peasantry. The name was also applied to a garment worn by knights over their armour.

Tabernacle, a place of worship; a sacred place; specifically in Hebrew history the Temple of Solomon which housed the Ark of the Covenant. "Spurgeon's Tabernacle" in London, built for the famous Baptist preacher in 1861, is a familiar non-Jewish example of the application of the name. The Mormon T. in Salt Lake City, Utah, holds several thousand and has an odd-shaped roof.

Tailor-Bird, name of a small group of warblers, familiar in India and China, and remarkable for their habit of sewing leaves together to enclose their nests. The bill is used as needle, vegetable fibre as thread, and a knot is tied to prevent it slipping.

Taiping Rebellion, 1850–65, revolt to overthrow the Manchu dynasty. It was suppressed in 1864 by the aid of Colonel Charles Gordon ("Chinese" Gordon).

Taj Mahal, the white marble mausoleum built at Agra by Shah Jehan in memory of his favourite wife who died in 1629. Over 20,000 men were occupied for over twenty years in its erection.

Takahe or **Notornis**, large New Zealand bird of the rail family which for many years was believed to be extinct. Small colony found in 1948 in remote valley of mountainous part of the S. Island. The bird is strictly protected.

Take-over Bid describes an offer made to all the shareholders of a company to purchase their shares at a named price and conditional upon acceptance by the holders of a named proportion of the total share issue. If accepted the purchaser thus gains control of the company.

Tallage, in Norman times, were taxes levied by the Crown upon lands of the royal demesnes. The levying of tallage was taken away by a statute of 1340 which required the consent of Parliament for all direct taxes.

Tallow, the more solid portions of animal fat, and prepared from beef, mutton, etc., by melting at a low temperature. Stearin is its chief constituent. Used for making candles, soap, etc.

Tally Office, in the Exchequer, was the department of the Government in which tallies were kept, representing the acknowledgment of moneys paid or lent; in 1834 the Houses of Parliament were burnt down through the overheating of a stove with discarded Exchequer tallies.

Talmud, the book containing the civil and canonical laws of the ancient Jews, comprising the Mishna (in Hebrew), a compilation from oral tradition, and the Gemara (in Aramaic), a collection of criticisms and comments of the Mishna by eminent Jewish Rabbis. There are two Talmuds—the Palestinian (or Jerusalem) finished at the beginning of the 5th century, and the Babylonian, at the beginning of the 6th.

Tambourine, a light, small, single-headed drum with loose metal discs let into the side of the hoop so that they jingle when the tambourine is shaken. An older name for it is the timbrel.

Tammany, a New York democratic organisation, sprang out of an old benevolent society named after an Indian chief, and has exerted a powerful influence over political movements in New York. The leaders of the organisation have used their power when their party has been successful at the polls to appoint their nominees to every prominent office, and have exacted bribes for concessions and privileges, and generally Tammany rule has meant wholesale corruption. Of this there is ample evidence in the disclosures of the Tweed and other Tammany frauds, and in the fact that the "Boss" for the time being usually contrives to make himself wealthy.

Tannins are chemical substances obtained from a variety of plants and trees, from oak-bark, and from galls. They are used in the leather trade, the tanning process making the skins resistant to decay.

Tantalum, a scarce bluish metallic element discovered by Ekeberg in 1802. Chemically related to vanadium and columbium, it is usually associated with the latter in nature. For several purposes it can be used in place of platinum, and it finds application in the making of surgical instruments.

Taoism. When Confucius (also founder of a world religion) was, about 530 B.C., a public servant to the prince of Chow—the "Middle Kingdom" of China—he met Lao-Tzŭ, who was treasurer to the state. Lao-Tzŭ was the founder of a religion very dissimilar to Confucianism; for, whereas Taoism is metaphysical, Confucianism is practical. Taoism is concerned with the individual, Confucianism with our relationships with others. *Tao*, the goal of the striver, is "Ultimate and Unconditioned Being" similar to the state of Nirvana of Buddhism. Lao-Tzŭ taught that one must be benevolent and compassionate; in particular, all forms of violence and compulsion are wrong. Idolatry was wrong and foolish, and, like Buddhism, there is little reference to a deity. Man must save his own soul by resignation and non-striving in order to reach the state of perfect Tao. After Lao-Tzŭ's death, however, the religion became corrupt, Lao-Tzŭ himself was deified, and various gods were worshipped—of war, weather, stars, seas, learning, etc. The greatest of Taoist scriptures, the *Tao-tê-ching*, may be read in Arthur Waley's translation *The Way and its Power*—it is one of the world's great devotional books. *See also* G13.

Tapestry, a fabric largely used in former times for wall decoration and hangings. It was known to the ancient Greeks, but in its modern form came into prominence in the 15th and 16th centuries, when it was manufactured in a marked

degree of excellence by the weavers of Flanders, especially those of Arras. The manufacture was introduced into England early in the 17th century, and was attended by considerable success. At the present day the term is applied to worsted cloths for furniture coverings, and there are also various kinds of tapestry carpets now made. The most famous tapestries of olden times were the Aubusson Tapestry and the Savonnerie. The Gobelin Tapestry factory, originated in Paris in the reign of Francis I., is still a national establishment. (*See also* **Bayeux Tapestry.**)

Tapioca, a food-substance yielded by the tuber of a tropical plant, called the manioc or cassava plant, poisonous in its raw state, but purified by roasting.

Tapirs. The tapirs constitute a family close to the horse family in the Ungulate order. They have four toes on the front feet and three on the hind. The snout is drawn out into a short trunk. The largest tapir is the Malayan tapir, which stands 3½ ft. at the shoulder. Four species occur in Central and S. America.

Tar is a dark viscid product obtained from the destructive distillation of wood, coal, peat, etc. Wood tar is acid owing to the presence of acetic acid ("pyroligneous acid"). The highest proportion of coal tar goes into road making. Distillation of coal tar yields many valuable compounds, including benzene, phenol (carbolic acid), naphthalene, and creosote; the final residue after distillation is pitch. Based on the chemical manipulation of compounds from coal tar is the preparation of many perfumes, food essences, drugs, antiseptics, and plastics.

Tarantula, the name given to a large range of big hairy spiders. Music was supposed to cure their sting, hence the Tarantella dance.

Targums, certain Aramaic paraphrases of portions of the Old Testament, first made orally and then written down about A.D. 100.

Tarpeian Rock at Rome received its named from the tradition that Tarpeia, the daughter of the Governor of the Citadel who betrayed the fortress to the Sabines, was crushed to death by their shields and buried beneath the rock. From this height persons guilty of treason were hurled to death.

Tartan, a cloth of woollen or worsted plaid; formerly each clan of the Scottish Highanders had its own tartan.

Tartaric Acid is prepared from tartar (potassium hydrogen tartrate) deposited in wine vats during fermentation. "Cream of tartar" is purified potassium hydrogen tartrate, which is incorporated in baking powder. Tartaric acid is also used in the manufacture of effervescent salts, and in medicine (*e.g.*, "tartar emetic").

Tartars (*or* **Tatars**), an Asiatic race who overran parts of Asia and Europe in the 13th century. Tartar is also a term used to denote a person of irascible temper, a vixen or shrew; to "catch a tartar" was to encounter more than was bargained for.

Tate Gallery, named after its founder, Sir Henry Tate, at Millbank, S.W., was opened in 1897; Sir Henry Tate bore the cost of the building (£80,000) and also contributed the nucleus of the present collection. "The Turner Wing," the gift of Sir Joseph Duveen, was added in 1910. The collection is thoroughly representative of British art and has been extended several times to include modern foreign art.

Taverns were not known before the 13th century. In Edward III.'s time there were only three in London; "one in Chepe, one in Walbrook, and the other in Lombard Street."

Tay Bridge spans the Tay at Dundee, is over two miles in length, and was opened for traffic on June 20, 1887. A previous bridge, completed in 1877, was blown down on Dec. 28, 1879, as a railway train was passing over it, and upwards of eighty people perished.

Tea was introduced into England about the middle of the 17th century, when it was a great luxury, and fetched from £6 to £10 a pound. It is an Asiatic plant, native properly to China, Japan, and India. Up to about 1885 most of the tea imported into this country came from China; the bulk now comes from India and Ceylon.

Teal, the smallest of the European ducks and next to the Mallard the commonest British species. It is a handsome bird and a very swift flier, but not as swift as the Garganey or Summer Teal.

Te Deum, the song of praise ("Te Deum laudamus"—"We praise Thee, O God"), is supposed to have been the composition of St. Ambrose in the 4th century and is used in Roman Catholic and English Church services.

Telecommunications. The sending of messages over a distance. The term is now generally applied to the sending of messages by telegraph, telephone, or wireless, or by a combination of such means. Experiments in electricity and magnetism by the European scientists Ampere, Gauss, Weber, and Steinheil, and those by Morse in America, made communication by telegraph practicable by the middle of the 19th century. In England, Cooke and Wheatstone produced an instrument in 1840, of the type later used by the Post Office, whose monopoly the telegraph service became. At first the electric telegraph (as distinct from the old semaphore, or optical telegraph) was used only by railway companies; under the patent of Cooke and Wheatstone, the first public line was laid from Paddington to Slough in 1843. The first submarine telegraph cable between England and France was laid in 1850 and, following Hertz's investigations into the production of electric waves, Marconi's invention led to this country being linked with Europe by wireless telegraphy in 1899. The first permanently successful telegraph cable across the Atlantic was laid in 1866. The first telephone service between London and Paris was opened in 1891. The electro-magnetic *Telephone* was invented by Alexander Graham Bell, a Scottish-born American, in 1876. Elisha Gray of the Western Union registered his patent only a few hours after Bell, and Thomas Edison was also active in the development of the telephone. In America the Edison-Bell interests were soon merged, but in Britain there were two rival companies until 1912, when the Post Office telephone system was established. The first submarine telephone cable to span the Atlantic was laid in 1955 and speech can now be transmitted over a distance of 2,000 miles. Before that, transatlantic communication was by radiotelephone, the first circuit being opened in 1927, and ship to shore telephonic communication in 1930. London is an international switching centre, through which telephonic communication is maintained by land lines, submarine cables, and wireless channels combined. During the second world war great strides were made in the development of wireless communications, the scope of which ranged from world-wide broadcasts of news and propaganda to the transmission of code messages by secret agents, from the linking of headquarters to units, to the carrying of small "walkie-talkie" sets by individual soldiers. In peace, as in war, ships and aircraft are now largely controlled by wireless signals; broadcasts of weather reports help shipping, aircraft, and farmers. Communication by short-wave radio is an important aid to modern police work.

Telemetry, measurement at remote distances by means of a radio-link from the object (missile or satellite) to the ground. The third Russian sputnik, for instance, carried apparatus for measuring, among other things, the pressure and composition of the atmosphere, and the intensity of different kinds of radiation from the sun. Its radio transmitter, powered by solar-energy batteries, sent out the information in coded form by means of uninterrupted signals at 20·005 megacycles with a duration of 150–300 milli-seconds.

Telepathy. The alleged ability of minds to communicate other than through the ordinary senses —"thought-transference." For a long time this was thought to be a mysterious process accepted by many laymen but denied by the scientist; it still remains mysterious, but is accepted by a certain number of scientists who have studied the matter. The first serious work on telepathy was done by the Society for Psychical Research (*see* **Psychical Research**), but a new era in discovery was ushered in by the publication of the book *Extrasensory Perception*, by the American scientist J. B. Rhine. Dr. Rhine claimed to have demonstrated the

faculty of telepathy in many normal people in a series of prolonged experiments in the laboratory. His method was to use a pack of cards ("Zener cards"), with four simple designs; the cards were lifted off the pack one at a time by the operator, and the person experimented on was asked to call out the name of the card being looked at by the operator. The results were surprising: one student guessed nine cards in succession out of the pack of twenty-five (a two million to one chance); a child of twelve guessed the whole pack correctly (something like six hundred million, million to one). Most results were, of course, less striking, but certainly seemed to justify the claim that telepathy was proven fact. Unfortunately, matters are less simple than this, and other workers have not obtained such satisfactory results.

Teleprinter, a telegraph transmitter with a typewriter keyboard, by which characters of a message are transmitted electrically in combinations of 5 units, being recorded similarly by the receiving instrument, which then translates the matter mechanically into printed characters. The telex or public teleprinter service provides direct person-to-person transmission of written messages.

Telescope, an optical instrument for viewing objects at a distance, "the astronomer's intelligencer." Lippershey is credited with construction of the first in 1608; Galileo constructed several from 1609 and Newton was the first to construct a reflecting telescope. The ordinary telescope consists of an object-glass and an eyelens, with two intermediates to bring the object into an erect position. A lens brings it near to us, and the magnifier enlarges it for inspection. A refracting telescope gathers the rays together near the eye-piece and is necessarily limited as to size, but the reflecting telescope collects the rays on a larger mirror, and these are thrown back to the eye-piece. The world's largest reflectors are at Mount Palomar Observatory, California (200 in.), Mount Wilson Observatory, California (100 in.), the McDonald Observatory at Mount Locke, Texas (82 in.), and the Victoria B.C. Observatory (72 in.). At the Royal Observatory, formerly at Greenwich, now at Herstmonceux, Sussex, a 98 in. *Isaac Newton* telescope is being installed. The *Hale* 200 in. telescope at Mount Palomar is the largest ever made and has revealed objects never before photographed; it is able to probe space and photograph remote galaxies out to a limiting distance of 2,000 million light years. The *Schmidt* telescope at Mount Palomar is to be used to make a huge photographic map of the universe. Manchester University has constructed at Jodrell Bank, Cheshire, a completely steerable radio-telescope with a paraboloid aerial 250 ft. in diameter. This telescope is the largest of its kind in the world. Early in its career it tracked the Russian earth satellites and the American lunar probes. *See also* **Observatories.**

Television, or the transmission of images of moving objects by radio. True television was first demonstrated by J. L. Baird at the Royal Institution in London in 1926. The B.B.C. began television broadcasts in 1930. *See* **Section X.**

Tellurium, a relatively scarce element discovered in 1782 by Reichenstein. Chemically it behaves rather like sulphur; its salts are known as tellurides. It occurs chiefly combined with metals in ores of gold, silver, copper, and lead.

Temperature of the Body. *See* **P61** (2).

Templars were soldier knights organised in the 12th century for the purpose of protecting pilgrims in their journeyings to and from Jerusalem, and obtained their name from having had granted to them by Baldwin II. a temple for their accommodation. At first they were non-military, and wore neither crests nor helmets, but a long wide mantle and a red cross on the left shoulder. They were established in England about 1180. During the crusades they rendered valuable service, showing great bravery and devotion. In the 12th century they founded numerous religious houses in various parts of Europe and became possessed of considerable wealth. It was this that caused their downfall. Kings and Popes alike grew jealous of their influence, and they were subjected to much persecution, and Pope Clement V. abolished the Order in 1312. Edward II. in 1308 seized all the property of the English Templars. The English possessions of the Order were transferred to the Hospitallers of St. John, afterwards called the Knights of Malta. The London Temple is on the site of the chief seat of the Order in this country. (*See also* **Hospitallers, Knights, Teutonic Order.**)

Temple, a building dedicated to the worship of a deity or deities. Those built by the ancient Greeks at Olympia, Athens, and Delphi were the most famous. The Temple of Diana at Ephesus was another. The Temple of Solomon at Jerusalem was destroyed and rebuilt several times; Herod's Temple was destroyed by the Romans in A.D. 70.

Temple Bar, an historic gateway that until 1879 stood at the western entrance to Fleet Street near the bottom of Chancery Lane. In olden times it was the custom to impale the heads of traitors over this gateway. It has been at Theobald's Park, Cheshunt, since 1888.

Tempo, a musical expression referring to the pace at which a composition is to be played, and generally used in combination with a qualifying word, as "Tempo Ordinario," ordinary time.

Tench, a familiar fresh-water fish of the Carp family, averaging some three pounds in weight, and of a mingled green and olive colour.

Tenor, the third voice in a male voice choir, *i.e.*, between alto and bass. The name is also applied to instruments of equivalent pitch, *e.g.*, tenor saxophone.

Terbium, an element, discovered in 1842 by Mosander, belonging to the group of rare-earth metals.

Teredo, the scientific name of the ship-worm, a peculiar bivalve mollusc, which lodges itself when young on the bottoms of wooden ships, and bores its way inwards, causing much injury.

Termites, also known as *White Ants*, though they are not related to the true ants and are placed in an entirely different insect order (*Isoptera*). They abound in the tropics and also occur in temperate countries, though only two species are common in Europe. There is no British species. They live in colonies and their nests take the form of mounds of earth and wood, cemented together with saliva, and up to 20 ft. in height. Five separate castes are recognised, three of them being capable of reproduction, and the other two are sterile.

Tern. This slender, gull-like bird has long pointed wings, a deeply-forked tail, pale grey and white plumage, black cap, and is a very graceful flier. There are several species, most of which are summer migrants to Britain. The Arctic tern winters in the Antarctic, returning to find a nesting place in the spring.

Terrapin, a kind of fresh-water tortoise. There are several species widely distributed in the Northern Hemisphere.

Territorial Army. The Territorial Force of the British Army came into being on Apr. 1, 1908, when the Volunteer Force and the Imperial Yeomanry combined; later in 1921 it was renamed the Territorial Army. This citizen army was administered by the various County Associations, voluntary bodies responsible for recruiting, clothing, quartering, and mobilising the T.A. units. On Sept. 1, 1939, the strength of the T.A. was 420,000 officers and other ranks, and thousands were ready to man the anti-aircraft, coastal defence, and searchlight stations at the outbreak of war. During the war the T.A. lost its independent existence and became merged into the Regular Army. After the war the Territorial Army was reorganised and in addition to its six infantry divisions, it had two armoured divisions, an airborne division, anti-aircraft and coastal defence formations, and independent armoured and infantry brigades. Under the Government's plans for the future organisation of the Army, published as a White Paper in July 1957, the Territorial Army battalions of regiments to be amalgamated are to retain their identity and existing titles.

Tertiary Rocks, in geology the rocks formed during the Caenozoic era comprising the Eocene, Oligocene, Miocene, Pliocene and Pleistocene periods. *See* **Geological Time Scale, F20.**

Terylene, trade name of the synthetic fibre discovered by two British scientists, J. R. Whin-

field and J. T. Dickson (Imperial Chemical Industries). It is marketed in the U.S.A. under the trade name *Dacron*. Full-scale production in Britain began in 1954. *Terylene* is a polyester fibre and textiles made from it are very strong, crease-resistant and mothproof and as the fibre is also resistant to chemical action and abrasion, it is finding a wide use in industry.

Tesla Coil, a type of induction coil.

Test Act, passed in 1673, prescribed that all government officers, civil and military, should be compelled to receive the sacrament according to the forms of the Church. It was repealed in 1828.

Testudo, the name given to a military movement in use by the ancient Roman soldiers. It consisted of a defensive screen formed by troops standing close together and massing their shields above their heads.

Teutonic Order, of German military knights, was founded in the Holy Land at the end of the 12th century for succouring the wounded of the Christian army before Acre. They were dispersed in the 15th century but the Order continued to exist until 1809, when Napoleon I. confiscated its properties. In 1840 the order was resuscitated in Austria as a semi-religious knighthood. (*See also* **Hospitallers, Knights, Templars.**)

Thaler, a German silver coin which has existed since the 16th century. The dollar is its derivative.

Thallium, a blue-grey metallic element discovered by Crookes in 1861. It is obtained from the flue dust resulting from the burning of pyrites for sulphuric acid manufacture.

Thallophytes *or* **Thallophyta**, the second largest division of the Plant Kingdom, which includes fungi, algae, and bacteria. These plants are not differentiated into roots, stems, and leaves, such an undifferentiated body being called a *thallus*.

Thames, the principal river of England, rising in the Cotswold Hills, and passing through Wiltshire, Berkshire, and Oxfordshire, and pursuing its ever-broadening seaward course through Reading, Windsor, Richmond, London, Greenwich, and Gravesend. It is about 210 miles long, and at the Nore, where it joins the sea, 6 miles wide. Commercially, it is the most important river of Great Britain. The tidal portion of the river is administered by the Port of London Authority and above Teddington by the Thames Conservancy, the lighthouse and pilotage by Trinity House. In the winter of 1683–84 the Thames was frozen for such a long spell that a *frost* fair was held upon the ice.

Thane *or* **Thegn**, a title of nobility used in Anglo-Saxon times, and in the reign of Athelstan conferred upon any free man who possessed five hides of land.

Theatres are buildings in which plays are performed. The theatres of the ancient Greeks and Romans were generally circular, with tiers of stone seats around them, and roofless. The first authorised theatre in England was that of Burbage, built in Shoreditch in 1574. Other theatres were erected at Bankside, in Southwark—the Globe, where some of Shakespeare's plays were first produced, and the Blackfriars. From 1642 to 1660 all London theatres were closed, but at the Restoration they were opened again, and for the first time women were allowed to appear on the stage, female parts having previously been played by young beardless men.

Theism, belief in a personal Deity.

Theodolite. The instrument used by surveyors for measuring angles in the horizontal and vertical planes. A *transit theodolite* is one which can be completely rotated around its horizontal axis.

Therm. The charges for gas for lighting and heating (formerly reckoned at per cubic foot) are now based on the calorific, or heat, value of the gas, and the unit used is termed a therm. The therm is 100,000 British thermal units.

Thermodynamics, a term first applied by Joule to designate that branch of physical science which treats of the relations of heat to work. What is called the first law of thermodynamics is thus stated by Clerk Maxwell: "When work is transformed into heat, or heat into work, the quantity of work is mechanically equivalent to the quantity of heat." The second law asserts that "the heat tends to flow from a body of hotter temperature to one that is colder, and will not naturally flow in any other way." *See* F15 (2).

Thermometer, an instrument by which the temperature of bodies is ascertained. The most familiar kind of thermometer consists of a glass tube with a very small bore, containing, in general, mercury or alcohol. This expands or contracts with variation in the temperature, and the length of the thread of mercury or alcohol gives the temperature reading on a scale graduated in degrees. Various forms of thermometer are used for particular purposes.

Thirty-nine Articles. (*See* **Articles.**)

Thirty Years' War, between the Roman Catholics and Protestants in Germany (1618–48). Before its termination involved most of the countries of western Europe. Concluded by the Treaty of Westphalia.

Thistle, Order of. (*See* **Knighthood.**)

Thorium, a scarce, dark grey metal discovered by Berzelius in 1828. All substances containing thorium are radioactive. Chief source of thorium is monazite sand, big deposits of which occur in Travancore (India), Brazil, and the U.S.A. Considered important as a potential source of atomic energy since the discovery that it can be transmuted into U233, which is capable of fission like U235.

Thorough Bass, a musical term applied to a voice part accompanied by numerals, showing the chord applicable to each note. The term also refers to the entire science of harmonic composition.

Thrush, a large family of song-birds related to the warblers, distributed all over the world. The British species include the robin, redstart, nightingale, song-thrush (or mavis), blackbird, missel-thrush, ring-ouzel of the mountains, and large numbers of migrant fieldfares and redwings from northern Europe are winter visitors.

Thumb-Screw, an instrument of torture used in olden times to extort confessions from prisoners. It consisted of a frame of three upright bars, between which the thumb of the victim was inserted; then a screw was turned on with sufficient force to give intense pain without jeopardising life.

Thunder, the sound heard after the occurrence of a lightning flash. It is due to vibrations of the air along the path of the flash, which are set up by the sudden heating (and expansion) followed by the rapid cooling (and contraction) to which the air is subjected. It is unusual for thunder to be heard more than 10 miles away, the distance being estimated roughly by allowing 1 mile for every 5 seconds which elapse between seeing the flash and hearing the thunder. Continued rolling of thunder results from the zig-zag nature of the flash and the multiple strokes of which it is composed, variations in the energy developed along the path, and echo effects. Thunderstorms are caused by powerful rising currents of air within towering cumulonimbus clouds and are most frequent during the afternoons and evenings of sunny summer days

Thursday, the 5th day of the week, named after Thor, the Scandinavian deity. To the ancient Romans Thursday was *dies Jovis*, or Jupiter's day.

Thyrsus, a staff carried in ancient Greece by the Bacchantes during their festivities. It frequently appears in ancient sculptures.

Tides, the periodical rise and fall of the waters of the ocean and its arms, are due to the attraction of the moon and sun. Newton was the first to give a general explanation of the phenomenon of the tides. He supposed the ocean to cover the whole earth, and to assume at each instant a figure of equilibrium, under the combined gravitational influence of earth, sun, and moon, thus making and controlling the tides. At most places there are two tides a day, and the times of high- and low-water vary according to the positions of the sun and moon relative to the earth. When earth, moon, and sun are in line (at full moon and new moon) the gravitational pull is greatest and we get "spring" tides. When sun and moon are at right angles (first

and third quarters of the moon's phases) we get the smaller "neap" tides.

Tiers Etat, the lowest of the three estates of the realm as reckoned in France—nobility, clergy, and *tiers état*—prior to the Revolution.

Tiger, a powerful carnivorous animal of the cat family, which occurs in India and certain other parts of Asia. Its skin is of a tawny yellow, relieved by black stripings of great beauty of formation. The tiger is hunted in India, and its ferocious disposition renders the sport both exciting and dangerous. The prey of the tiger includes buffaloes, antelopes, and occasionally human beings, though the man-eating tiger is the exception rather than the rule. Some tigers attain a length of from 9 to 12 ft.

Time based upon the sun being exactly south at noon is referred to as local apparent time (L.A.T.). As the apparent solar day is, however, of variable length the interval between successive transits of an imaginary "mean sun" is adopted as the unit, being designated local mean time (L.M.T.). The latter is derived from the former by adding or subtracting the so-called "equation of time" which varies from $+ 14°$ minutes in the middle of Feb. to $- 16\frac{1}{2}°$ minutes at the beginning of Nov. By common consent the meridian of Greenwich is accepted as the prime meridian; local mean time at Greenwich (G.M.T.) is the standard to which other mean times are usually referred. One degree of longitude corresponds with 4 minutes of time. Countries east of Greenwich keep their clocks in advance of G.M.T., countries to the west keep them slower. To avoid the inconvenience of local time variations, Standard Time has been adopted by most countries, whereby clocks are adjusted to an hourly system of changes based on a geographical succession of the meridians, 15° apart.

Times, The, daily newspaper founded in 1785 by John Walter (1739–1812), as *The Daily Universal Register*, renamed *The Times* in 1788. The business was transferred to the younger son, John Walter (1776–1847), in 1803 and his enterprise, ability and independence made the paper world-famous. Considerable changes took place in 1908 and Lord Northcliffe took over financial control. On his death in 1922 the paper came under the control of John Walter, great-great-grandson of the founder, and Col. the Hon. John Astor (now Lord Astor), who is now chairman of the Times Publishing Company. Sir William Haley was appointed editor in 1952.

Timpani, the kettledrums in an orchestra. (*See* **Drums**.)

Tin is a white metal, whose commonest ore is cassiterite (tin oxide), which occurs in Malaya, Indonesia, Bolivia, Belgian Congo, Nigeria, and Cornwall. It protects iron from rusting, and the tin coating on tinplate is applied by dipping the thin steel sheet in molten tin or by electrolysis. Tin alloys of importance include solder, bronze, pewter, Britannia metal, etc.

Tit *or* **Titmouse**, a small insectivorous bird of the woodlands and forests, bright of plumage and very active and agile, often seen hanging upside down searching for food. There are over fifty species, eight of which occur in Britain: the Great and Blue Tits, familiar in gardens and countryside, the Cole Tit, Marsh Tit, Willow Tit, Bearded Tit, Long-tailed or "Bottle" Tit, and the Scottish Crested Tit.

Titanium, a scarce metal difficult to extract from ores, found in association with oxygen in rutile, anatase, and brookite, as well as with certain magnetic iron ores. It combines with nitrogen at a high temperature. Discovered by the Rev. William Gregor in 1791. Titanium alloys, being very resistant to stress and corrosion, and combining strength with lightness, are finding wide application not only in marine and chemical engineering but in the building of aircraft, rockets, and the nuclear-energy field.

Tithes, an ecclesiastical tax consisting of a tenth part of the annual produce known to the ancient Jews, and first imposed by Christian authorities in the 4th century, although not made compulsory in England before the 9th century. Tithes derived from land are termed "prædial," those derived from cattle being styled "mixed," while others are personal. After the passing of the Tithes' Commutation Act of 1836, tithes were gradually converted into rent charges, and to-day the old form of tithes exists only to a small degree. Consult Tithe Act of 1936.

Toad. The frogs and toads are grouped together in the same category of amphibians, and the two terms are not based on any sharp scientific distinction between them. As a rough guide it can be said that toads have a more squat appearance and their skins are warty. Two toads occur in Britain, the Common Toad and the Natterjack. The latter can be identified by the narrow light stripe running down the middle of the back.

Tobacco is made from the leaves of various narcotic plants of the *Nicotiana* family, which contain a volatile oil and an alkaloid called nicotine. Tobacco is largely grown in America, India, Japan, Turkey, Greece, Canada, Italy, Indonesia, Bulgaria, Philippines, France, Belgian Congo, China, S. and N. Rhodesia, S. Africa, S. America, and other countries of a warm climate. It undergoes various processes of preparation. The leaves are first dried, then cut into small pieces, moistened and compressed, and in this form it is known as cut or "shag" tobacco; when moistened with syrup or treacle and pressed into cakes, it is Cavendish; when twisted into string form, it is "twist" or "pigtail." For cigars the midribs of the dry leaves are removed, and what is left is moistened and rolled into cylindrical shape. For snuff, the tobacco leaves are moistened and allowed to ferment, then dried, powdered and scented.

Toga, an outer robe worn by the ancient Romans and corresponding to the pallium of the Greeks. It was white and made of wool.

Toleration Act was passed in 1689, to relieve Protestant dissenters from the more serious of the disabilities under which they had previously laboured.

Tolls. Payments for privileges of passage were first exacted in respect of ships passing up rivers, tolls being demanded on the Elbe in 1109. Tolls for land passage are said to have originated in England in 1269, toll-bars being erected at certain distances on the high-roads in the 17th century, where toll had to be paid for all vehicles passing to and fro. After about 1825 they began to disappear, but still linger on some country roads and bridges. Tolls on London river bridges ceased in 1878–79.

Tone Poem *or* **Symphonic Poem**, a musical work of a serious nature and of symphonic dimensions in which the composer has not adopted the forms and conventions of the true symphony.

Tonic Sol-Fa, a system of musical notation in which monosyllables are substituted for notes. Thus the major diatonic scale is represented by Doh, Ray, Me, Fah, Soh, La, Te, Doh. The system was invented by a Miss Glover of Norwich in about 1840 and has proved of great assistance in the teaching of music in schools.

Tonsure, the shaven part of the head of a Roman Catholic ecclesiastic, dates from the 5th or 6th century. In the Roman Catholic Churches only a circle, or a crown, is shaved, while in the Greek Church shaving is forbidden.

Topaz, a transparent mineral gem, being a silicate and fluoride of aluminium and generally found in granitic rocks. Its colour is yellow, but it also occurs in pink and blue shades. The best kinds come from Brazil.

Topiary, the art of clipping and trimming trees, shrubs, etc., into ornamental shapes. This art goes back to Elizabethan times when gardens were formal and the shapes simple and symmetrical. By the end of Queen Anne's reign topiary had become much more elaborate, and all kinds of fanciful shapes were produced.

Tornado, a violent whirlwind, characterised by a black funnel-shaped cloud hanging from heavy cumulonimbus. Usually tornadoes are only a few hundred feet in diameter and occur frequently in the Mississippi region of the U.S.A., where it has been estimated that the wind speeds within them may exceed 200 m.p.h. In West Africa the term is applied to thundery squalls.

Tortoises and **Turtles**, are cold-blooded reptiles, four-footed, and encased in a strong shell protection, the shells of some species being of beautifully horny substance and design, in much demand for combs, spectacle frames, and

ornamental work. It is the custom to designate the land species as tortoises and the aquatic kinds as turtles. The green turtle, so called because its fat has a green tinge, is in great demand for soup. Together the tortoises and turtles make up the reptilian order called *Chelonia*, the biggest representatives of which are the giant land tortoises of the Galapagos Islands, reaching a weight of 500 lb. and living a century. Some of these giant tortoises are even said to have reached 200 or 300 years of age.

Toucan, a South and Central American family of brilliantly coloured birds, remarkable for their huge bills, which often attain a length of from 6 to 8 in. Toucans live on fruit, are of arboreal habits, and nest in holes.

Touchstone, a kind of jasper called by the ancients "Lydian stone," of economic value in testing the quality of metal alloys, especially gold alloys. The testing process is very simple. The alloy is drawn across the broken surface of the Touchstone, and from the nature of the mark or streak it makes the quality of the alloy can be ascertained.

Tourmaline, a mineral occurring in different colours in prismatic crystals, and remarkable for its action on light, having the power of polarising light rays under certain conditions. It is a double silicate of aluminium and boron, and occurs in Cornwall, Devon, South America, and Asia.

Tournaments were equestrian contests between military knights and others armed with lances, and frequent in the Middle Ages. The Normans introduced them to England.

Tower of London was a royal palace from the time of the Conqueror, who began the building of the White Tower in 1078. Later kings made considerable additions. Between the 15th and 18th centuries many princes and nobles were executed or imprisoned here, and here Henry VI., Edward V., and his brother were put to death. The Crown Jewels are kept at the Tower, and in the Armoury a fine collection of armour of various dates is preserved. The attendant staff are called Yeomen Warders of the Tower. Their style of dress is of the Tudor period.

Tractarianism, a term that came into use from about 1833 in reference to a religious movement (the Oxford Movement) headed by Pusey, Keble, Newman, and other Oxford high churchmen, who published "Tracts for the Times." Among other things, they advocated a higher degree of ceremonial in worship, and their enthusiasm put new activity into the Church, although the secession to Rome of some of their more prominent members showed the tendency of the movement.

Trade-Mark, a mark used in relation to goods for the purpose of indicating a connection in the course of trade between the goods and some person having the right, either as a proprietor or registered user, to use the mark. Trade-marks can be registered, the registration holding good for 7 years and being renewable thereafter indefinitely for periods of 14 years. Infringement of a registered trade-mark renders the infringer liable to damages.

Trade Winds form part of the circulation of air round the great permanent anticyclones of the tropics and blow inwards from north-east and south-east towards the equatorial region of low pressure. Atlantic trades are more regular than those of the Pacific. The belts may extend over 1,500 miles of latitude and, together with the Doldrums, move north and south in sympathy with the seasonal changes in the sun's declination, the average annual range being about 5 degrees of latitude. The discovery of the regularity of the trade winds is usually credited to Columbus.

Trafalgar, Battle of, was fought off Cape Trafalgar on Oct. 21, 1805, between the British under Nelson and the French and Spanish under Villeneuve and Gravina. It was a complete victory for the British, but Nelson was killed.

Trafalgar Square. The site has often been referred to as the finest in Europe. It was conceived originally as a square by John Nash (1752–1835) when the project was considered of linking Whitehall with Bloomsbury and the British Museum. It was to be named after the new monarch as King William the Fourth's Square but on the suggestion of George Ledwell Taylor (a property owner near the site) alteration to the more popular name Trafalgar Square was agreed to by the King. On the north side the National Gallery was planned by Nash and erected by William Wilkins on the place of the Royal Mews—a work of William Kent a century before. The lay-out was the idea of Charles Barry but he did not approve the erection of the Nelson column (which see). His idea was for the square to have a grand flight of steps from the north side with sculptural figures of Wellington and Nelson but the Commons decided otherwise and the column as designed by William Railton was begun in 1840. The two fountains by Barry were supplanted in 1948 by ones designed (1938) by Sir Edwin Lutyens. Executed in Portland stone they are flanked by some bronze sculptures. In the same year memorial busts of Lords Jellicoe and Beatty were placed by the north wall.

Transcendentalism, a term applied to a system of philosophy which transcends ordinary experience. It originated in Germany, and had for its chief apostles Richter, Fichte, and Schelling. In America Emerson propounded transcendental theories.

Transept, the portion of a church which extends across the interior between the nave and the choir.

Transistors. *See* **F66.**

Transubstantiation, a term which first came into recognised use in the controversy between Berengarius and Lanfranc in the 11th century, indicating the supposed conversion of the bread and wine of the Eucharist into the body and blood of Christ, and called the doctrine of the "Real Presence."

Trappist. (*See* **Cistercians.**)

Treadmill, a large cylindrical machine provided with a series of steps, and maintained in rotary motion by the pressure of men's weight. A rail is fixed outside the wheel, and to this the workers of the treadmill hold by their hands, while their feet are kept continually in motion from step to step, the weight of their bodies keeping the machinery revolving. It is no longer used in prisons as a form of punishment.

Treasure-Trove, a legal term applying to money, plate, or bullion found hidden in the earth, or elsewhere, and for which there is no owner. The treasure legally belongs to the Crown, but it is the practice to reward the finder with the full value of the property on its being delivered up. Coroners Act, 1887, provides that inquests may be held, but not as to title as between the Crown and any other claimant.

Treble, the highest voice in a male voice choir. This is, of course, a boy's voice, the highest adult male voice being the alto. In a mixed choir the treble part is sung by sopranos.

Tree Frog. The true tree frog occurs most commonly in America and Australasia. The common European tree frog is a brilliant green animal, the adhesive discs at the tips of its fingers and toes enabling it to cling to trees, etc., with ease.

Tree Shrew, an arboreal insectivorous mammal of Asia belonging to the family *Tupaiidae*. Tree shrews are related to the shrews, though in appearance they resemble squirrels except for their sharply pointed snout. They occur in Borneo, Siam, China, and Malaya.

Trematodes *or* **Trematoda,** the class of flat worms comprising the parasitic flukes. The liver fluke of sheep is the best-known species.

Trent, Council of, the longest and one of the most important in the history of the Roman Catholic Church, was convened to combat the doctrines of Martin Luther. It first sat in 1545, the last sitting being in 1563. At this Council the general policy, principles, and dogmas of the Roman Catholic Church were authoritatively settled.

Triangle, in music a metal percussion instrument in the form of a triangle which, when struck by a metal rod, emits a sound of no particular pitch.

Triassic *or* **Trias,** the earliest geological period in the Mesozoic era, which began some 225 million years ago. Triassic formations 25,000 ft. thick occur in the Alps. *See* **F20.**

Modern insects were appearing, and also small reptile-like mammals. Other important Triassic animals were: dinosaurs, ichthyosaurs (marine reptiles), and pterosaurs (flying reptiles).

Tribunes, name assigned to officers of different descriptions in ancient Rome. The original tribunes were the commanders of contingents of cavalry and infantry. The most important tribunes were the tribunes of the plebs, first elected in 494 B.C. as the outcome of the struggle between the patrician and the plebeian orders. They held the power of veto and their persons were sacred.

Trichoptera. This is the insect order comprising the Caddis-flies. These are moth-like insects, having hairs on the wings. They are usually found fluttering weakly near water. The larvæ are aquatic and are remarkable for the cases (caddis cases) which they build out of sticks, small stones, sand grains, and shells.

Tricolour, the flag of the French Republic since 1789, consisting of three nearly equal vertical bands of blue, white, and red (ratio 90 : 99 : 111).

Triennial Act, which fixed the duration of Parliament to three years, was passed in 1641. Charles II. repealed this Act, it was re-enacted in 1694; in 1716 the Septennial Act was passed. In 1911 it was made five years' duration.

Trilobites, extinct aquatic arthropods, most abundant in the Cambrian and Ordovician systems. Their appearance may be roughly described as resembling that of a woodlouse, and like that animal the trilobites were capable of rolling their bodies up into a ball.

Trimurti, the Hindu triad, Brahma, Vishnu, and Siva, symbolised as an entity. In the depictions of the Trimurti three distinct heads are represented, the theological unity combining Brahma, the creative power, Vishnu, the preserving element, and Siva, the destroying principle, in one supreme unification.

Trinity, the term applied to the Godhead, "three persons and one God," as it is expressed in the Litany—Father, Son, and Holy Ghost. The doctrine of the Trinity has general acceptance among Christian communities, and has been explained in different ways. One of the earlier statements of it is the Athanasian: "We worship one God in Trinity, and Trinity in unity: neither confounding the Persons, nor dividing the substance."

Trinity House, on Tower Hill, London, was incorporated in 1514 as an association for piloting ships, and has ever since been entrusted with various matters connected with the regulation of British navigation. Since 1854 the lighthouses of the country have been under its supervision. The acting Elder Brethren act as Nautical Assessors in Marine causes which are tried by the High Court of Justice.

Trio, strictly a musical composition for three voices or instruments. The third movement, of a classical symphony is usually in three-beat time and the second subject of the movement, which is of ternary form, is often called the Trio. Thus, Minuet and Trio, Scherzo and Trio.

Triptych, a picture, carving, or other representation, with two swing doors, by which it could be closed in; frequently used as an altar-piece. Also a writing tablet in three parts, two of which folded over the one in the centre.

Trireme, an ancient vessel with three rows of oars, of great effectuality in early naval warfare. Mentioned by Thucydides. It was a long, narrow vessel propelled by 170 rowers. The Romans copied it from the Greeks.

Trisagion ("thrice holy"), an ancient Jewish hymn, still regularly sung in the service of the Greek Church. A version of it—"Tersanctus"—also forms part of the Anglican Eucharistic service.

Tritium, a radioactive isotope of hydrogen which has three times the weight of the ordinary hydrogen atom. It is produced by bombarding an isotope of lithium with neutrons and has a half-life of 12½ years, decaying with the emission of β-particles (electrons).

Triumvirate, a term used to denote a coalition of three persons in the exercise of supreme authority. The first Roman triumvirate was that of Pompey, Julius Cæsar, and Crassus, 60 B.C.; the second was that of Mark Antony, Octavus, and Lepidus, 43 B.C.

Trombone, a bass wind instrument which has a tube of variable length. By moving the slide, which shortens or lengthens the tube, the player causes the trombone to emit different notes.

Tropic-Bird, a long-tailed sea bird, of which there are 3 species (the Red-billed, the White-tailed, and the Red-tailed), frequenting the tropical regions of the Atlantic, Pacific, and Indian oceans. They are commonly called Bo'sun Birds.

Troposphere. The atmospheric layer which extends from the earth's surface to the stratosphere. As a general rule the temperature in the troposphere falls as altitude increases. (*See* **Atmosphere.**)

Troubadours, lyric poets who flourished from the 11th to the end of the 13th century, chiefly in Provence and the north of Italy. They were often knightly amateurs, and cultivated a lyrical poetry intricate in metre and rhyme and usually of a romantic amatory strain. They did much to cultivate the romantic sentiment in days when society was somewhat barbaric and helped considerably in the formation of those unwritten codes of honour which served to mitigate the rudeness of mediæval days. *See also* **G39** (1).

Trouvère *or* **Trouveur,** mediæval poet of northern France, whose compositions were of a more elaborate character—epics, romances, fables, and chansons de geste—than those of the troubadour of the south. Flourished between the 11th and 14th centuries.

Truffles are subterranean edible fungi much esteemed for seasoning purposes. There are many species, and they are found in considerable quantities in France and Italy, less commonly in Britain. They are often met with under beech or oak trees, and prefer calcareous soils, but there are no positive indications on the surface to show where they are, and they are not to be cultivated. Hogs, and sometimes dogs, are used to scent them out, the former, by reason of their rooting propensities, being the most successful in the work.

Trumpet, a brass wind musical instrument in which different notes are produced by the operation of three "valves."

Tsetse, an African dipterous fly belonging to the same family as the house-fly. It is a serious economic pest as it transmits the protozoon causing African sleeping sickness when it pierces human skin in order to suck blood, which forms its food.

Tuatara or *Sphenodon punctatum*, a primitive lizard found in New Zealand. It has a rudimentary third eye on the top of the head; this is called the pineal eye and corresponds to tissue which in mammals forms the pineal gland.

Tuba, an alternative name for the Bass Saxhorn in E flat or F. (*See* Saxhorn.)

Tube Foot, the characteristic organ of locomotion of starfishes and kindred animals. They are arranged in pairs along the underside of the arms, and their sucker-like ends can grip a surface very tightly. The action of the suckers depends on hydraulic pressure.

Tudor Period extends from 1485 to 1603. The first Tudor sovereign was Henry VII., descended from Owen Tudor; then followed Henry VIII., Edward VI., Mary, and Elizabeth, the last of the line.

Tuesday, the third day of the week, named from the Saxon deity Tuisto, Tiw, or Teusco. To the Romans it was the day of Mars.

Tuileries, a French royal and imperial palace dating from 1564. It was attacked by insurgents during the outbreaks of 1793, 1830, and 1848, and was burned down during the Commune of Paris in 1871.

Tumulus, a mound of earth raised over the bodies of the dead. The mound of Marathon, enclosing the bodies of the Athenians who were killed in the famous battle with the Persians, is a celebrated tumulus. Such mounds were commonly raised over the tombs of the distinguished dead in ancient times, and sometimes enclosed heavy structures of masonry. The Roman "barrows" were tumuli. Evidences of such mounds are frequent in prehistoric remains.

Tun, a liquid measure formerly in general use, but now obsolete. A tun of ale was 216 gallons.

Tuna *or* **Tunny,** a large marine fish belonging to the mackerel family, frequenting the warm waters

of the Atlantic, Pacific, and Mediterranean. Tuna fisheries are an important industry.

Tundra is the name of a vast treeless plain of Northern Russia with small lakes and morasses scattered here and there, but almost devoid of vegetation. It is a cold, bare region, where only the reindeer can find sufficient sustenance.

Tungsten, a hard, brittle metal, silver to grey in colour. Its chief ores are wolframite (iron and manganese tungstate) and scheelite (calcium tungstate). Tungsten is alloyed in steel for the manufacture of cutting tools; also in the non-ferrous alloy stellite (*vide*). Electric lamp filaments are made from tungsten. Tungsten carbide is one of the hardest substances known and is used for tipping tools.

Turbines propelled by steam provide power for the propulsion of many ships, and on land steam turbines are a principal source of power, being used in large central electricity stations, for instance, to convert heat energy into electrical energy. Gas turbines have recently come into use in aeroplanes, and gas-turbine railway locomotives are being developed. The first gas-turbine ship had its trials in 1947, just half a century after the first steam-turbine ship.

Turbot, a large flat fish, highly valued as food. It often attains from 30 to 40 lb. in weight. Its flesh is white and firm. It is confined to European waters, and is caught by line or trawl.

Turkey, a fowl of American origin, brought to Europe from America soon after the discovery of that country. It was a domesticated bird in England in the first half of the 16th century. *See* **Y11–12.**

Turpentine, an oily substance obtained from coniferous trees, mostly pines and firs. It is widely used especially in making paints and varnishes, and also has medicinal properties.

Turquoise, formerly called Turkey-Stone, is a blue or greenish-blue precious stone, the earliest and best specimens of which came from Persia. It is composed of a phosphate of aluminium, with small proportions of copper and iron. India, Tibet, and Silesia yield turquoises, and a variety is found in New Mexico and Nevada. It derives its name from the fact that the first specimens were imported through Turkey.

Turtle Dove, a beautiful fan-tailed pigeon, a summer visitor from Africa to southern England. It is a small, slender bird with reddish-brown upper parts, pinkish throat, black tail with white edges.

Tweed. A rough-surfaced fabric of the twilled type, usually all-wool, though cheaper kinds may include cotton. Of a soft, open, flexible texture, it may have a check, twill, or herringbone pattern. Harris, Lewis, Bannockburn, and Donegal tweeds are well known. "Tweeds" is said to have been written in error by a clerk for "twills."

Twelfth Night is the eve of the feast of the Epiphany, and in olden times was made the occasion of many festivities. It was the most popular festival next to Christmas, but is now little observed.

Twilight is the light which is reflected from the upper portion of the earth's atmosphere when the sun is below the horizon (before sunrise or after sunset). The term is most usually understood to refer, however, to the evening light; the morning light we call dawn. The twilight varies in duration in different countries, according to the position of the sun. In tropical countries it is short; in the extreme north it continues through the night.

Tyburn, a former small tributary of the Thames, which gave its name to the district where now stands the Marble Arch, Hyde Park. Here public executions formerly took place.

Tycoon, the title by which the commander-in chief of the Japanese army (virtually the ruler of Japan) was formerly described by foreigners. (In Japanese *taikun* means great lord or prince.) The term is now applied, usually in a derogatory sense, to an influential business magnate.

Tympanum is, in architectural phraseology, the triangular space at the back of a pediment, or, indeed, any space in a similar position, as over window or between the lintel and the arch of a doorway. In ecclesiastical edifices the tympanum is often utilised for sculptured ornamentation.

Tynwald, the title given to the Parliament of the Isle of Man, which includes the Governor and Council (the Upper House), and the House of Keys, the representative assembly. This practically constitutes Home Rule, the Acts passed by the Tynwald simply requiring the assent of the Sovereign.

Typhoon. (*See* **Cyclone.**)

U

Uhlan, a light cavalry soldier armed with lance, pistol, and sabre and employed chiefly as skirmisher or scout. Marshal Saxe had a corps of them in the French Army; and in the Franco-German war of 1870 the Prussian Uhlans won fame.

Ultramarine, a sky-blue pigment obtained from *lapis lazuli*, a stone found in Tibet, Persia, Siberia, and some other countries. A cheaper ultramarine is now produced by grinding and heating a mixture of clay, sulphur, carbonate of soda, and resin.

Ultramontanism is the term applied to the views of Roman Catholics who desire that absolute authority in religious affairs should be vested in the Pope, subordinate only to the Œcumenical Council.

Ultrasonics *or* **Supersonics,** the term applied to waves of frequencies greater than those of audible sound waves and less than those of radio waves. The first instrument for producing supersonic waves was Galton's Whistle; this showed that cats and dogs, for instance, can hear "sounds" which are inaudible to humans. The commonest type of supersonic generator depends on the piezo-electric effect of crystals, which start vibrating when an alternating current is applied to them. (The crystals usually used are of quartz, Rochelle salt, or tourmaline.) Supersonic echo-sounders have been used for detecting submarines, wrecks, shoals of fish, etc., and they are invaluable instruments for measuring the depth of the sea. The term "ultrasonics" is superseding "supersonics," owing to the increasing use of the word "supersonic" in aeronautics, where it is applied to speeds exceeding the velocity of sound.

Ultra-Violet Rays. These are invisible rays whose wave-lengths are less than 3,900 Angstrom units (this unit is one hundredth of a millionth of a centimetre). The sun's radiation is rich in ultra-violet light, but much of it never reaches the earth, being absorbed by molecules of atmospheric gases (in particular, ozone) as well as by soot and smoke particles. One beneficial effect of ultra-violet light on human beings is that it brings about synthesis of vitamin-D from certain fatty substances (called sterols) in the skin. The wave-lengths which effect this vitamin synthesis also cause sun tan and sun burn. Ultra-violet lamps (which are mercury-vapour discharge lamps) are also used for sterilising the air inside buildings, their rays being lethal to bacteria. Many substances fluoresce under ultra-violet light; for instance, zinc silicate glows green, while cadmium borate throws out red light. This phenomenon is applied practically in fluorescent lamps, the light of requisite hue being secured by judicious mixture of the fluorescent materials which coat the lamp. (*See* **Electric Light.**)

Uncials were a form of written characters used in times prior to the 10th century; while smaller than capitals they were larger than the later minuscule. The term uncial was a misapplication of St. Jerome's *literæ uniciales*, "inch-high" letters.

Unction, the act of anointing with oil, a symbol of consecration practised in the Roman Catholic, Greek, and other Churches, but not in the Protestant. *Extreme unction* is the rite of anointing a dying person with holy oil. This function consists in anointing the eyes, ears, nostrils, mouth, the palms of the hands, and the soles of the feet.

Underground Gasification, the process of converting coal into gas underground. Briefly an "underground gasworks" comprises two approximately vertical shafts connected by a gallery through the coal seam, which is ignited. Air is led down one of the shafts, and the gas produced is drawn off from the second shaft.

The technique was worked out by the British chemist, Sir William Ramsay, but it was not until 1933 that it was tried seriously—in the Donetz coalfield in Russia. America, Italy, and Belgium are experimenting with underground gasification; British experiments ended in 1959.

Unicorn, a fabulous single-horned animal. In heraldry its form is horse-like, with the tail of a lion and pointed single horn growing out of the forehead.

Union Jack. *See* **N10.**

Union of Great Britain and Ireland was proposed in the Irish Parliament in Jan. 1799 after the 1798 Rebellion and came into force on Jan. 1, 1801. The troubled history of Ireland, associated with the question of self-government, nationalism, land, and religion, culminated in the Easter revolution of 1916. A treaty giving the 26 southern counties independence in 1921, as the Irish Free State, was followed by a period of internal dissention. In 1937 a new constitution was enacted in Eire in which no reference was made to the Crown. This, however, left in force the External Relations Act of 1936 and with its repeal in 1948, Eire separated itself from the British Crown and thus severed the last constitutional link with the Commonwealth, and became an independent Republic.

Union, Treaty of, was the treaty by which Scotland became formally united to England, the two countries being incorporated as the United Kingdom of Great Britain, the same Parliament to represent both, Scotland electing sixteen peers and forty-five members of the House of Commons. Uniformity of coins, weights, and measures was provided for, Scottish trade laws and customs were assimilated to those of England, and as regards religion and the practices of the law, Scotland was to continue as before. This Act was ratified on May 1, 1707.

United Nations. *See* **C16–21.**

Universe in astronomy means not only the star system (of which the sun and planets are a small part) but all the countless star systems or nebulae which may be separated from each other by millions of light-years. *See* **F3–7.**

Universities are institutions of higher education whose principal objects are the increase of knowledge over a wide field through original thought and research and its extension by the teaching of students. Such societies existed in the ancient world, notably in Greece and India, but the origin of the University as we know it today lies in mediaeval Europe, the word *universitas* being a contraction of the Latin term for corporations of teachers and students organised for the promotion of higher learning. The earliest bodies to become recognised under this description were at Bologna and Paris in the first half of the 12th century; Oxford was founded by an early migration of scholars from Paris, and Cambridge began with a further migration from Oxford. Other Universities sprang up all over Europe, including three in Scotland—St. Andrews (1412), Glasgow (1451), and Aberdeen (1494)—which were followed by Edinburgh in 1582. These six bodies remained the only Universities in Great Britain until the foundation in 1826–29 of University and King's Colleges in London (resulting in the establishment of the University of London in 1836) and of the University of Durham in 1832. The period since 1850 has been a great century of academic growth, in which the new Universities of Belfast, Birmingham, Bristol, Exeter, Hull, Leeds, Liverpool, Manchester, Nottingham, Reading, Sheffield, Southampton, and Wales were founded, the latest creation being that of Leicester in 1957. There are now 22 Universities in Great Britain and Northern Ireland and one University College (North Staffordshire). The Republic of Ireland has Trinity College, Dublin (founded in 1592), and the National University of Ireland, with its three constituent University Colleges at Dublin, Cork, and Galway. The 19th century also saw a wide extension of the University movement throughout the British Empire, the early important foundations being McGill (1821), Toronto (1827), and Laval (1852) in Canada; Sydney (1850) and Melbourne (1853) in Australia; New Zealand (1870); South Africa (1873); Bombay, Calcutta, and Madras in 1857 in India; and the University of the Punjab (1882) in the present Pakistan. There are now seventy-nine Universities of full status in Commonwealth countries outside the United Kingdom; three of these are in the Colonies (Hong Kong, Malaya, and Malta), and since the war University Colleges have been instituted in the West Indies and in East and West Africa and Rhodesia. In the U.S.A. the development of higher education has left the Universities less sharply defined than in Europe and the Commonwealth, but there are nearly 1,900 institutions of higher education covering 2,297,000 students, the best-known Universities being Harvard, Yale, Princeton, Columbia, and Chicago. The range of studies that may be pursued at a University covers humanities and sciences, and includes training for the liberal professions. It is customary for Universities to confer degrees on students who reach certain educational standards, the principal titles being those of Bachelor, Master, and Doctor in the particular discipline. In England a certain emphasis has always been placed on the provision of residential facilities for students; the ancient Universities of Oxford and Cambridge are entirely collegiate in character, while the modern Universities have halls of residence for a growing proportion of their students. In Great Britain in 1958–59 there were over 100,000 full-time University students (one quarter women) compared with 50,000 in 1939; 75% held scholarships or other financial awards. Through the University Grants Committee H. M. Treasury subsidises the recurrent expenditure of Universities to the extent of more than £36 million per annum, but they are self-governing institutions free from State control. An International Association of Universities was founded under UNESCO auspices, with headquarters in Paris, in 1950. The Association of Universities of the British Commonwealth, established in 1912, holds quinquennial Congresses (the most recent at Montreal in July 1958) and publishes the *Commonwealth Universities Yearbook* as a detailed work of reference; its office is in London. *See also* **N23–26.**

University Boat-race. *See* **U37.**

Ur of the Chaldees, and probably the site of Abraham's early home, is an ancient Sumerian site where important excavations have been conducted by Taylor in 1854 and by Hall and Woolley in this century. The excavated graves and other discoveries have thrown valuable light on the period subsequent to the "Flood" and have added much to modern archæology. *See also* **G17** (2).

Uræus, the sacred serpent of the ancient Egyptians, always represented on the head-dresses of divinities and royal personages. It was the symbol of supreme power, and was in the form of an asp.

Uralite, a mineral produced when a pyroxene rock is metamorphosed into hornblende.

Uranium, a metal discovered by Klaproth in 1789 in pitch-blende. It is a white metal which tarnishes readily in air. Great developments have followed the discovery that the nucleus of the uranium isotope Uranium 235 undergoes fission, and uranium minerals have become very important since it was found that atomic energy could be released controllably by taking advantage of fission. (*See* **Atomic Bomb, Atomic Pile.**) Previous to the second world war the uranium content of all the uranium ores that were mined was estimated at 1,000 tons. Since then uranium mining has been surrounded by military secrecy, and no figures are being published. Before atomic energy work began to take the major part of the world's output of uranium minerals, the chief users of uranium compounds were the ceramics and textile industries. *See also* **Nuclear Fission, F11** (1).

Uranus. This planet was discovered by Herschel in 1781. Its diameter is 32,000 miles and its average distance from the sun is 1,783 million miles. It has four small satellites.

Ursa Major, the Greater Bear, or "Charles's Wain," a constellation familiar to all observers because of the brilliance of the seven stars forming its outline. It never sets in these latitudes.

Ursa Minor, the Lesser Bear Constellation, has, like Ursa Major, seven prominent stars, of which the pole star is the brightest.

Usquebaugh, is the old Celtic name for spirit, distilled originally from barley. The name is still used in Scotland. Burns, in *Tam o' Shanter*, wrote, "Wi' usquebae we'll face the de'il."

Utilitarianism is a term that originated with the Italian philosopher Beccaria, and has for its aim "the greatest happiness of the greatest number," and insists that this should be the sole aim of all public action. Jeremy Bentham was the chief propounder of the philosophy, and in more recent times John Stuart Mill advocated it with much acceptance. Herbert Spencer's exposition of the theory represented a still higher development of it.

Utopia was the imaginary island of Sir Thomas More's ideal state, where the conditions of life and government were perfect. The work, published in 1516, was the forerunner of a host of such books by Bacon, Lytton, Bellamy, and, of the 20th century H. G. Wells.

Utrecht, Treaty of, was the treaty which concluded the war of the Spanish Succession in 1713.

V

Vaccination, a system of inoculation against small-pox discovered by Dr. Jenner in the 18th century. In Great Britain it is usual for all infants within 6 months of birth to be vaccinated unless the parent conscientiously believes that it would be harmful to the infant's health. *See* **P63** (2).

Vagrancy was the subject of stringent punishment under the old English laws. Various penalties were branding, setting in the stocks, mutilation of the ears, and transporting to the Colonies. The Vagrancy Act of 1824 repealed all former laws. Many Acts have since been passed.

Valentine's Day, the 14th Feb., is a festival in celebration of St. Valentine, one of the Christian martyrs of the 3rd century. A sweetheart or Valentine is chosen on that day and letters or tokens sent secretly to the object of affection.

Valhalla, in Scandinavian mythology, is the special Paradise to which the souls of warriors slain in battle were transported. The term is also generally used to designate a burial place of great men.

Valkyries, the chosen handmaidens of Odin, appointed to serve at the Valhalla banquets. Their most important office, however, according to the Norse mythology was to ride through the air at a time of battle and point out the heroes who were to fall. It is one of these Valkyries who is made the heroine of Wagner's opera "Die Walküre."

Vampire *or* **Werewolf,** according to ancient superstition, was a spectre in human form which rose from its grave in the night-time and preyed upon the living as they slept, sucking their blood, and then returning to the grave.

Vampire-Bats, blood-eating bats of tropical America. They puncture the skin with their incisor teeth, leaving a wound that bleeds profusely. The blood is lapped up by the bat, not sucked.

Vanadium, a scarce metallic element whose chief ores are carnotite and patronite. Some iron ores contain it. Most of the vanadium commercially produced finds its way into vanadium steels, which are used for tools and parts of vehicles, being hard, tough, and very resistant to shocks.

Vandals were a Teutonic race who ravaged Gaul, Spain, and North Africa in the 5th century, and finally attacked the city of Rome, drawing down upon themselves universal opprobrium for their wanton destruction of beautiful objects and monuments.

Vanilla, a climbing orchid of tropical America, found also in Asia; the dried fruit of certain species furnishes the agreeable aromatic vanilla of commerce, though most vanilla essence now used is prepared synthetically.

Varnish is of two leading kinds: spirit varnish, made from resinous substances dissolved in spirit; and oil varnish, in which the dissolving agent is linseed oil and turpentine.

Vatican, the Papal residence at Rome, a famous palace on the hill adjacent to St. Peter's. Its museum is a rich treasure-house of literary and artistic objects.

Vauxhall Gardens, a famous London pleasure resort from the early part of the 18th to the middle of the 19th century. It was here that many great singers appeared, where the earliest balloon ascents were made, and where there were fine displays of fireworks.

Vedas, the sacred writings of the ancient Hindus, comprising hymns, sacred formulæ, and prayers, and the oldest books in existence.

Vehmgericht, a mediæval tribunal said to have been founded by Charlemagne in the 9th century. It dealt with cases in which the penalty of death was involved. The last of these courts was held in 1568, by which time the suppression of the tribunal had become a public necessity.

Ventilation is a process of supplying fresh air to and removing contaminated air from rooms and buildings. It is a science that has been much studied in recent years and has led to the adoption of methods of air renewal by which the public health has been greatly improved. A recent development of the study of ventilation is air-conditioning. Being independent of outside atmospheric conditions, the air can be kept pure and at a suitable temperature.

Ventriloquism, the art of speaking in many voices and at apparent different distances, without seeming motion of the lips. The art was practised by the ancient Greeks and Romans.

Venus, the planet second in order from the sun and distant from that orb 67,200,000 miles. It is 7,760 miles in diameter. At wide intervals Venus passes between the earth and the sun, when what is called the "Transit of Venus" takes place. The last transit was in 1882. There will not be another until 2004.

Venus' Fly-trap, a well-known insectivorous plant (*Dionæa muscipula*) occurring in Carolina in damp mossy places. It is related to the Sundew. The leaf is the organ that catches the insects. The leaf blade is in two halves, hinged along the centre line. Each half bears three sensitive hairs called "trigger hairs." When an insect touches a trigger, the two halves of the leaf clap together, trapping the insect between them, when it is digested by a secretion from the leaf, which afterwards absorbs the soluble products.

Vera (vision electronic recording apparatus), a new British invention of recording television programmes on magnetic tape instead of, as formerly, by photographic film. The great advantage of the new "telerecording" machine is that it dispenses with the need for processing, and so avoids delay, and is particularly suitable for newscasts, outside broadcasting and TV talks.

Verdigris, a green deposit formed upon copper when exposed to the air. Verdigris is used both as a mordant and as a pigment.

Vermilion, a pigment obtained from cinnabar, but generally made artificially from a mixture of one part of sulphur with four of mercury. It yields a bright red colour.

Vernalization. Seeds which, after being exposed to a low temperature, produce plants that flower earlier than usual are said to have been "vernalized." This technique of seed treatment devised by Lysenko is called vernalization. It is claimed to have been widely used in Russia to obtain cereal crops in places where climatic conditions are favourable for only a short season.

Versailles, Treaty of. The Peace Treaty, 1919, ending the First World War. The first half was devoted to the organisation of the League of Nations. Among the territorial changes Germany ceded Alsace-Lorraine to France, Posen and the Corridor to Poland. Germany undertook to disarm, to abolish universal military service, to keep only a small army of 100,000 and a small navy. Her colonies were to be shared out among the Allies under League Mandates. Reparations were to be paid, but were gradually reduced and entirely ceased in 1932. Hitler took unilateral action against the Treaty especially in regard to rearmament and the annexation of Austria. Hitler's attempt to change the eastern frontiers was the immediate cause of the Second World War.

Verst, a Russian measure of length equal to 3,500 ft., *i.e.*, about two-thirds of an English mile.

Vestals were priestesses of ancient Rome, appointed to guard the perpetual fire consecrated to Vesta, goddess of hearth and home. They were required to take vows of chastity, and during the thousand years from Numa, 710 B.C., to Theodosius, A.D. 394, when the order was abolished, only 18 vestals were condemned for incontinence.

Viaticum (literally "provision for a journey"), an expression designating the ministering of Holy Communion to one on the point of death.

Vicar of Bray, the original of the ballad of that name was Simon Alleyn, vicar of Bray between 1540–85, who was "twice a Papist and twice a Protestant," as Fuller asserts, serving under four monarchs, Henry VIII., Edward VI., Mary I., and Elizabeth.

Victoria and Albert Museum, in Kensington, London, was begun in 1852 as the Museum of Ornamental Art at Marlborough House. The present building was completed in 1909, and has the following nine departments: Architecture and Sculpture; Ceramics; Engraving, Illustration and Design; Metalwork; Paintings; Woodwork; Textiles; Library (of books on art) and Book-production; and the Dept. of Circulation. The Bethnal Green Museum is a branch of the V. and A.

Victoria Cross, an order of merit for conspicuous valour, awarded to members of the Army, Navy, and Air Force, was established in 1856. In July 1959 it was announced that all holders of the V.C. for whom the British Government is responsible would receive a tax-free annuity of £100.

Vicuna, a large mammal of the camel family, found wild in the mountain regions of Bolivia and Chile. It yields a wool which is made into dress fabrics.

Vienna Congress, sat at Vienna from Sept. 1814 to June 1815, and settled the delimination of the territories of the various European nations after the defeat of Napoleon. The Treaty of Vienna which resulted gave Ceylon, Mauritius, Cape Colony, Heligoland, Malta, and part of Guiana to England; France was not permitted to hold more territory than she had possessed at the outbreak of the Revolution in 1789; Austria took Northern Italy; Russia part of Poland; and Prussia, part of Saxony and the Rhenish province. Except for one or two changes the clauses of the treaty were maintained for over forty years.

Viet-Minh, the Indo-Chinese (Annamite) national movement led by Ho Chi-Minh which resisted French rule from 1945 to 1954, when agreement was reached at the Geneva Conference.

Vikings were Scandinavian sea-plunderers who, from the 8th to the 10th centuries, were the terror of northern waters. They excelled in shipbuilding, were fine sailors and splendid craftsmen. *See also* **G32** (2).

Vinegar. This condiment and preservative is a weak solution of acetic acid (3–9%) formed by the oxidation of ethyl alcohol by the action of bacteria on alcoholic liquor (wine, beer, cider, fermented fruit juices, or malted cereals). Wine vinegar is usually red; malt vinegar is brown. (*See also* **Acetic Acid.**)

Viola, a stringed instrument of the violin type but rather larger than the violin. Music for the viola is written mainly in the alto clef, though the treble clef is used for the higher notes.

Violin, a stringed instrument rather smaller than the ancient viol from which it derives. It is held under the chin for playing, the right hand bowing while the left hand "stops" the strings. The violin has been used in its present form since the 16th century, the most famous maker being Antonio Stradivari of Cremona.

Violoncello, a member of the violin family of stringed instruments whose pitch corresponds with that of the bass voice. It is played while between the knees as was the old *viola da gamba*.

Viper, a family of poisonous snakes of which there is one example in Britain, the common viper or adder, only found in very dry localities.

Virginal, an English keyboard instrument of the harpsichord type greatly in vogue during Elizabethan times.

Virgo, the 6th constellation of the Zodiac, lying between Leo and Libra. It has seven prominent stars ranged in the form of the letter "Y." One of these stars is of the first magnitude, the other six being of the third magnitude.

Virtues, Cardinal. *See* **Cardinal Virtues.**

Visibility is defined by the distance at which the farthest of a series of objects, specially selected to show against the skyline or in good contrast with their background, can be distinguished. Visibility depends chiefly upon the concentration of water or dust particles suspended in the air. Instruments are available to measure the obscurity of the atmosphere more directly, including that at night. A large lapse rate of temperature and a strong wind are favourable to good visibility; a small lapse rate, calm or light wind favourable to bad visibility. Fog is when the visibility is less than 1,100 yds.; mist or haze when it is between 1,100 and 2,200 yds. (*See* **Pollution.**)

Viscount, a title of rank coming between that of Earl and Baron. The title originally stood for deputy-earl. The first English Viscount was Viscount Beaumont, created in 1440.

Vishnu. The second person of the Hindu Trinity, representing a principle of stability, to whom the creation of the world is sometimes attributed.

Vitamins, name of a group of organic substances found in relatively minute amounts in certain foodstuffs, essential for growth and the maintenance of normal bodily structure and function. The Hungarian biochemist Szent-Györgyi, who first isolated vitamin C or ascorbic acid, defined the vitamin as "a substance that makes you ill if you don't eat it!" *See* **P42** (2), **70.**

Vitriol, the old name of sulphuric acid, represented in its pure form by oil of vitriol. Sulphate of copper forms blue vitriol; sulphate of iron, green vitriol; and sulphate of zinc, white vitriol.

Vivandière, a female camp follower informally attached to French military regiments, and acting as vendor of liquors, fruits, etc.

Vivisection, the dissection for scientific purposes of living animals. The practice has been strongly opposed by humanitarians, and Acts have been passed for restricting vivisection to authorised persons.

Vizier, more correctly **Vizir,** literally "burden bearer" or helper, originally the chief minister of the Abbasid (second of the two great dynasties of the Mohammedan empire) Caliphs.

Volcanoes are mountains or mounds beneath which, in the depths of the earth, there is a continual fire that at intervals throws up flame, molten rock (lava), ashes, etc. The most active volcanoes of modern times have been those of Ætna, Vesuvius, and Stromboli, in Italy; Hekla in Iceland; and Mont Pelée in Martinique. The last-named was in violent eruption in 1902, when the chief town of St. Pierre was completely destroyed and many lives were lost.

Vole. There are three species of British vole: the Field-vole, the Bank-vole, and the Water-vole.

Volt, the electro-motive force unit, named after Volta, and defined in terms of the ohm and the ampere. *See* **N13** (1).

Voltmeter, instrument for measuring voltages.

Vraic, a name for seaweed in the Channel Islands, where it is extensively used as a manure.

Vulgate, a term used to designate the Latin version of the Scriptures sanctioned by the Council of Trent.

Vulture, a famous bird of prey of two distinctive groups; that of the Old World, which has the nostrils divided by a mass of bone, and the New World vulture, which has no such division. Vultures feed on carrion and are the great scavengers of tropical regions. The European species are the Griffon Vulture and the Egyptian Vulture, which, however, have seldom been known to visit England. Vultures have no feathers on the head and neck.

W

Wading Birds, an order of migratory, long-legged, long-billed birds, frequenting marshes and shallow waters. They include the plovers, avocets, stilts, oystercatchers, curlews, phalaropes, godwits, dunlins, sandpipers, redshanks, greenshanks, snipe, woodcocks, the pratincole of the Mediterranean, and the sun bittern of tropical America. Many species breed in Britain.

Wagtail, a familiar long-tailed small bird, of which four species are British, the Pied (or Water), Grey, Yellow, and White Wagtails, while the Blue-headed Wagtail also occasionally makes his appearance. Wagtails nest in ruts, and are active of habit.

Waits, the night minstrels who sing carols at Christmas in the open, a remnant of the old-time minstrels attached to Courts and feudal dwellings.

Wakes were originally parish festivals in celebration of the patron saint's day and the dedication of the church in the all-night vigil. Regulated by law in 1536, they gradually fell into desuetude, or became divorced from their former significance; also vigils for the dead before interment.

Waldenses, the name given to an heretical Christian sect which arose in the south of France in the second half of the 12th century in protest against the worldliness of the clergy. Their leader, Peter Waldo of Lyons, had a translation of the New Testament made into Provencal, and his teaching stirred men to lead more holy lives. They were persecuted but not destroyed and survive to this day in the valleys of Piedmont. Cromwell interceded and obtained for them increased toleration, and Milton used his pen on their behalf. Since 1848 they have had full freedom of worship, and membership has steadily increased. They have a theological school at Florence.

Walloons, name given to the French-speaking population of the southern provinces of Belgium, in contrast to the Flemings or Dutch-speaking population of the northern provinces. The Walloon areas contain the mining and heavy industries of the country; the Flemish regions are more agricultural. The number of Walloons is estimated at about 3 millions; the number of Flemings at about 5 millions.

Walpurgis Night, the night before May 1st, when witches and creatures of evil are supposed to have liberty to roam. Named after St. Walpurgis, an English nun, who went on a mission to Germany in the 8th century. There is a famous Walpurgis night scene in Goethe's *Faust*.

Walrus, a very large marine mammal, related to the seals but having in the upper jaw two large curved tusks, which average in length from 15 in. to 2 ft. It lives on fish, and inhabits the Arctic seas. An adult walrus can exceed 12 ft. in length and weigh over a ton.

Waltz, a popular round dance, danced in couples, introduced into England from the Continent in 1813.

Wapentake, the ancient name given in the northern counties to territorial divisions corresponding to the Hundreds of southern counties.

Wapinschaw, an ancient Scottish custom of assembling the people for the purpose of testing their capacity for bearing arms and their readiness to take the field.

Wapiti, a large North American deer, often, but erroneously, styled the elk; once abundant, but now surviving only under protection.

Warblers, a family of small, lively song-birds, closely related to the flycatchers and thrushes. Represented in Britain by 34 species, including the chiffchaff, one of the earliest spring visitors, willow-wren, wood-warbler, blackcap, garden-warbler, whitethroats, sedge- and grasshopper-warbler.

Wasps. Some wasps are social insects, others are solitary. The former build nests of papier maché, produced by chewing wood. The solitary wasps either build nests of mud or burrow in the ground. The sting of wasps, found only in females, is acid and needs to be neutralised with an alkaline substance, *e.g.*, the traditional "blue bag," baking soda, etc.

Water Boatman, a common aquatic bug which rows with its oar-shaped hind legs.

Water Deer, the Chinese musk deer, an animal of small size and aquatic habits, and hornless.

Waterloo, Battle of, was fought on June 18th, 1815. The Allies (British, German, and Dutch) under Wellington and Blücher defeated the French under Napoleon. This ended Napoleon's career.

Waterloo Bridge, crossing the Thames, was built by Rennie, and opened in 1817. It had nine arches, each of 120 ft. span, was built of granite, and had a length (including approaches) of 2,456 ft. The present bridge, completed in 1942, and formally opened Dec. 10, 1945, is a fine example of reinforced concrete construction. (Architect, Sir Giles Gilbert-Scott.)

Water-Spider, an interesting little animal which spins a sac of silk on a water-plant, which it uses as a sort of diving bell. Into this bell it introduces bubbles of air, one at a time; thus the spider is enabled to remain below the surface a considerable time.

Waterspout, whirling tornado-like cloud, occurring at sea. It begins as a cone of cloud tapering slowly downwards, the sea surface becoming disturbed; on reaching the centre of the cloud of spray the spout takes on the appearance of a column of water. A number of these vortices may form fairly close together at about the same time, their duration ranging up to 30 minutes.

Watling Street, the name of the old Roman road which ran from the Channel ports by way of London to Shropshire. (*See also* **Roman Roads.**)

Watt. A metric unit of electrical power equivalent to 1 joule (10 million ergs) of work per second. 746 watts equal 1 horse-power, and the kilowatt (1,000 watts) is about 1⅓ horse-power. *See* **N13** (1).

Wax, the name applied to certain plant substances or mixtures, and used for various purposes, such as the making of wax candles, bleaching, and making artificial flowers, anatomical models, etc., also in pharmacy for blending in the composition of plasters, ointment, etc. The best-known natural wax is beeswax, and there are others, such as spermaceti, obtained from the sperm whale, and Chinese wax, which is a cerotyl cerotate.

Waxbill, a small Oriental and African bird of the *Ploceidæ* family, with wax-like bill and beautifully variegated plumage. The Java sparrow, the South African Grosbeak, and the Blue-breasted waxbill are attractive, and often find their way into cages.

Wayz-Goose, the name generally given to a festive gathering of people employed in printing and other works, so called from the fact that in earlier times a goose was the principal dish of the feast.

Weasel. A carnivore mammal found in Britain, smallest member of the group including the Stoat, Polecat, and Pine-marten, about 8 in. long. Its fur is reddish on the upper side of the animal, white on the under side; it may all turn white in winter with the exception of the tail.

Weather, the factors determining to-morrow's weather are so manifold, variable, and complex that the task of the meteorologist is no easy one. There are still people who cling to the idea that weather is determined by the phase of the moon, but their predictions have no scientific backing, and can be dismissed. Changes in temperature, humidity, and speed of air masses can best be measured by instruments designed for the purpose. Weather forecasts are now a regular feature of the B.B.C. broadcast, the information being supplied by the meteorological staff of the Air Ministry. By taking into account the peculiar character of any part of the country, whether coastal, high- or low-lying, industrial, sheltered, precise forecasts for that particular region can be made up to twenty-four hours ahead and sometimes longer. The British Isles lie in the path of depressions moving north-eastward across the Atlantic. It is the frequency, intensity, and speed of these centres of low pressure, which give these islands such changeable weather. On the other hand, when an anticyclone builds up and embraces the British Isles, settled weather is fairly certain, the type of weather, whether dull or cloudless, warm or cold, depending mainly on the direction of the wind in the particular area concerned and the time of year. An American earth satellite, *Vanguard II*, was launched in Feb. 1959 to serve as the first "weather-eye" in space.

Weather Lore. Before instruments were invented to measure atmospheric conditions, man relied on his own observation of wind and sky, behaviour of birds and animals, and came to associate certain phenomena with types of

weather. Many popular weather rhymes have survived the centuries, and as long as forecasting is confined to the next 24 hours there is perhaps something to be said for them, particularly those dealing with the winds. What is very unlikely is that next year's summer can be predicted from this year's winter, or that one month's weather is related to that of another. The study of past records reveals too many exceptions for such predictions to be of much use in forecasting.

Weaver Bird, the popular name for a large group of finch-like birds belonging to the family *Ploceidæ*, found principally in Africa but also in Southern Asia and Australia and remarkable for their habit of building nests formed of blades of grass dexterously interwoven and suspended from the boughs of trees.

Weaving has been practised since before any times of which we have record. The Egyptians credit the invention to Isis, the Grecians to Minerva. The main principle of the weaving loom is the same to-day as it was thousands of years ago; a warp extends lengthwise through the loom, the threads being held in separate regular order by being passed through a reed or "slay," while the weft is crossed through alternating threads of the warp by means of a shuttle which holds the weft. Thus the fabric is built up. Weaving was done by hand up to the early part of the 19th century, when Cartwright's steam-power loom was introduced, and is now in universal use. The Jacquard loom for weaving figured designs dates from 1801.

Wedding Anniversaries are: first, Cotton; second, Paper; third, Leather; fourth, Fruit and Flower; fifth, Wooden; sixth, Sugar; seventh, Woollen; eighth, Salt; ninth, Copper; tenth, Tin; twelfth, Silk and Fine Linen; fifteenth, Crystal; twentieth, China; twenty-fifth, Silver; thirtieth, Pearl; fortieth, Ruby; fiftieth, Golden; sixtieth, Diamond.

Wednesday, the 4th day of the week, derived its name from Woden or Odin, the Norse god of war.

Weever, a species of sea-fishes which possess the power of inflicting stings by means of the dorsal fin and a spine on the gill cover.

Weevil. The term is applied to members of a group (called Rhynchophora) of beetles with a snout at the end of which is the mouth. Certain weevils are serious pests in granaries, while the cotton-boll weevil does enormous damage.

Weights and Measures. Crude standards of weights and measures existed in the ancient world, and the degree of standardisation increased as civilisation progressed. Weight was taken from the grain, which is still the smallest unit. Ancient measures were based on the natural proportions of the human body, the digit or breadth of the middle part of the first joint of the forefinger being taken as the lowest unit. Under Richard I. standards of weights and measures had to be provided for the whole kingdom by the sheriffs of London. Today the Standards Department of the Board of Trade is responsible for the national standards of weights and measures. *See* **N11–13**.

Werewolf, a man or woman, who according to mediaeval belief, could be turned by witchcraft or magic into a wolf, eat human flesh or drink human blood, and turn into himself again. This belief was widely held in Europe, and similar superstitions prevail among most primitive peoples, *e.g.*, the "leopard man" of certain African tribes. Lycanthropy (from Gr. = wolf-man) is a form of madness in which the patient imagines himself a beast.

Western Church, the catholic church (Rome), as distinct from the eastern or orthodox church (Constantinople); 1054 marks the date of the final separation of eastern and western Christendom.

Westminster Abbey stands on the site of an old church and Benedictine foundation of the 7th century. It was rebuilt under Edward the Confessor, and again under Henry III., and important additions were made by Edward II., Edward III., Richard II., Richard III., and Henry VII., the latter erecting the beautiful eastern chapel in the perpendicular style which bears his name. The western towers and front were rebuilt by Wren in the 18th century. It contains tombs of many sovereigns, of the Unknown Warrior, and many other illustrious men are commemorated by monuments.

Westminster Cathedral, seat of the Roman Catholic Archbishop of Westminster. It was designed by J. F. Bentley and built between 1895 and 1910. It is of red brick, in early Christian Byzantine style with a domed campanile, 283 ft. high, and a decorative interior.

Westminster Hall, adjoining the Houses of Parliament, was built as a Banqueting Hall by William Rufus, and many courtly festivals were held there in succeeding centuries. King John established the Law Courts there. It now forms a gigantic hallway, leading to the Houses of Parliament, but was used as a Banqueting Hall in Aug. 1905, when the then Prime Minister, Mr. Balfour, entertained the officers of the French Fleet there. Many famous people (Charles I., Sir Thomas More, Warren Hastings) have been tried there.

Whale, a completely aquatic mammal; the fore-limbs are modified to form fin-like paddles and there is virtually no external trace of the hind-limbs. There are two major groups of whales—the *Toothed Whales*, including the Sperm-whale (Cachalot), Dolphins, Killer-whales, and Porpoises; and the *Whalebone Whales*. In the latter a series of whalebone plates grow down from the roof of the mouth, and, being frayed at their edges into a hairy fringe, together constitute a filtering mechanism. The animal takes in sea water containing minute organisms on which it feeds; the mouth is then closed and the tongue raised when the water is forced out through the filter, on which is left the food. As the tongue is lowered, the whalebone plates straighten up, flicking the food on to the tongue, which transfers it to the gut. Most whale oil is obtained from the thick layer of fat under the skin (blubber), but in the Sperm-whale there is a large reserve of oil in the head. The oil is used for making candles, margarine, and soap. Ambergris used in perfumery comes from the intestine of whales. The number of whales that may be killed in a Season is limited by International Convention.

Whigs, a political name which came into use in the time of Charles II., and designated the progressive party down to the passing of the Reform Bill of 1832, when it was superseded by the term Liberal.

Whimbrel, a bird of the Curlew family, more common in Scotland than in England.

Whinchat, a small migratory bird, which is a breeding visitor to Britain (Apr. to Oct.); bright brown plumage, spotted with darker brown.

Whip, an M.P. responsible to his Party for the organisation of the voting M.P.s. He is responsible for ensuring the presence of (or whipping up) a sufficient number of members to carry the vote through.

Whip-poor-Will, the name of the American nightjar, which gets its name from its three-syllable call-note. It is a nocturnal bird, catching its insect food on the wing.

Whirlpool, a circling current of water often of great power, capable of drawing into its centre and submerging small vessels. The most famous whirlpool is the maelstrom on the Norwegian coast.

Whirlwind, a sudden circular rush of opposing winds, which often causes much damage.

Whisky, an ardent spirit distilled from malt or other grain, and containing a large percentage of alcohol. It has a greater consumption than any other spirit, and is of many kinds, Scotch and Irish whiskies being chiefly consumed in this country, and being of pot still or patent still production, or a blend of the two. Whisky is the most heavily taxed product; in 1661 a duty of 4*d.* a gallon was imposed, today the duty is £10 10*s.* 10*d.* on a proof gallon. American whiskies are mostly distilled from corn or rye.

Whitebait, the name given in Great Britain to young fish, mainly herring and sprat, sold and eaten when about 2 in. long. In New Zealand the whitebait is the juvenile of a native fish called "inanga." It is about 2 in. long, wholly transparent, and belongs to the family of fresh-water fish *Galaxia*.

White Elephant, a term in common use to designate

a gift that causes the recipient more trouble or cost than it is worth; derived from an old-time custom of the Kings of Siam who presented a white elephant to a courtier whom it was desired to ruin.

Whitehall Palace, erected within sight of Westminster Abbey in the 13th century, was the residence of the Archbishops of York until Henry VIII. took possession of it in 1530. Thenceforward to 1697, when it was burned down, it continued to be the favourite town residence of royalty, and to the Stuarts especially it was a great centre of court festivities. In those days, with its grounds, it extended from the Strand to the river. The only portion of Whitehall now standing is the Banqueting Hall built by Inigo Jones, on a scaffold projected from the front of which Charles I. was beheaded. A block of new government buildings has recently been built on part of the site of the old Palace.

White House, the official residence at Washington of the President of the United States.

Whitsuntide, the festival celebrating the descent of the Holy Ghost and occurring seven weeks after Easter.

Whole-tone Scale, a musical scale all of whose intervals are tones. This scale has been popularised by Debussy.

Whydah Bird, the widow-bird of Equatorial Africa. The Paradise Whydah is remarkable for the long tail and handsome black-and-scarlet plumage of the male during mating season.

Widow Bird, certain species of African weaver birds with predominantly black plumage. In the breeding season the male birds are strikingly beautiful, with scarlet and buff markings and long tail feathers.

Wigeon, a surface-feeding duck of northern Europe, known in Britain more as a winter visitor than a nesting bird. It feeds in flocks in the muddy estuaries and has a characteristic "whee-oo" call.

Willow, a water-side-loving tree of the genus *Salix*, to which the osiers belong. The best cricket-bat blades are made from a white willow, *S. alba* var. *cœrulea*, a fine tree with bluish-green leaves, mostly found in Essex. Willow is also used for polo balls. Weeping willow, *S. babylonica*, is native to China and is the willow seen on Old China willow-pattern plates. It was introduced into England at the end of the 17th century.

Wimple, an antique outdoor covering for the neck, chin, and sides of the face, of silk or linen, worn by women in Anglo-Saxon and Norman days; and still retained as a Conventual dress for nuns in some places. It was bound on the forehead by a golden and jewelled fillet.

Winchester College, a famous school for boys, founded by William of Wykeham in 1387.

Wind, air set in motion by special atmospheric conditions, is of various degrees, from a slight rustling breeze to a hurricane. Winds are *constant*, as in trade winds or anti-trade winds; *periodic*, as in monsoons and other wind-visitations occurring according to influences of season; *cyclonic* and *anti-cyclonic*, when their motion is spiral; *whirlwinds*, *hurricanes*, and *tornados*, when high temperature and great density induce extreme agitation. Ordinarily, a wind is named from the point of the compass from which it blows, or it may be expressed in degrees from true north. The *sirocco*, the *mistral*, and the *simoom* are local forms of winds of great velocity. A *blizzard* is a biting blast of icy temperature. *See also* **N10**.

Windmills were in use in the East in ancient times, but were not much seen in Europe before the 13th century. Wind sawmills were invented by a Dutchman in the 17th century, and one was erected near the Strand in London in 1633. Great improvements have been made in these mills in recent years, especially in the United States, where, by the application of the wind-shaft principle, much space is saved and the mills can be used for pumping, grinding, and other purposes.

Windows, originally apertures for the admission of the wind into dwellings, began to be made of glass and used only for the admission of light in very early times. There is evidence of glass windows having been used at Pompeii, but they did not become common in England before the 12th century. A window tax was imposed in 1697 and again at later dates for special revenue purposes. It was repealed in 1851 and a tax on inhabited houses substituted.

Windsor Castle, the famous British royal residence on the banks of the Thames, as it now stands, was mainly built by Henry III., though a royal residence had existed there from the time of the Conqueror. Additions were made by Henry VIII., Elizabeth, and Charles II. Windsor Park and Forest comprise over 13,000 acres.

Wine, the fermented juice of the freshly-gathered grape. There are innumerable varieties, each obtaining its distinctive character from the species of wine producing the grape, the locality of the vineyard, method of cultivation, etc. Wines are of three main kinds: *sparkling*, as in champagne, due to their having been bottled before fermentation is complete; *beverage*, when the must has been fermented out before bottling. Such wines include the famous red and white wines of Burgundy, Bordeaux and the Rhone valley and the white wines of the Rhine Moselle and Loire valleys. Wines are *fortified* by the addition of brandy before fermentation is complete, examples being Port and Sherry. The principal wine-producing areas of the world are: France, Italy, Algeria, Spain, Portugal, Rumania, Argentine, Yugoslavia, U.S.S.R., Greece, Germany, Hungary. *See* **S39–42**.

Wireworm, the larva of the click beetles. Wireworms are a serious pest of grass, cereal crops, potatoes, etc.

Witchcraft, the practice of sorcery or magic based on superstitition and flourishing where people are ignorant of the causes of natural phenomena. Belief in witches takes many different forms, varying with time and place. In Europe witchcraft flourished from the 14th to the 18th centuries and gradually decayed with the spread of scientific knowledge. Johann Weyer (1515–88), a German physician, showed that the majority of "witches" were mentally ill but his views were denounced by the Catholic Church. Heresy was confused with sorcery and many thousands were persecuted and suffered death under the Inquisition, including those interested in scientific experiment. In England and Scotland all Witchcraft Acts were repealed in 1736, in Ireland not until 1821. *See also* **Sorcerers** and **Magic**.

Witan *or* **Witenagemot**, the name given to the Great Council of the Anglo-Saxons, "the Council of the Wise Men," and composed of the leading nobility.

Woad, a plant (*I satis tinctoria*) that in olden days was largely used in England for the blue dye obtained from it. It is a biennial plant belonging to the same natural order of flowering plants as the wallflower and is still cultivated in some parts.

Wolves, well-known carnivorous animals still found in many parts of Europe, but not existing in Britain since the middle of the 17th century.

Woodcock, a wading bird, greatly valued for its flesh. It is a member of the snipe family, and breeds in Britain. The parent bird is able to carry its young between its thigh and body when flying to and from the feeding spots. It is one of the birds protected by the Game Laws.

Wood-Louse, any terrestrial isopod crustacean of the *Oniscidæ* family. They have segmented bodies and many legs, and feed mostly on decaying matter, animal and vegetable. The best known is the Pill Wood-louse (*Armadillidium*), which rolls itself into a ball when touched.

Woodpecker, a familiar tree-climbing bird of conspicuous plumage, of which three species are found in Britain, the green woodpecker or yaffle (because of its harsh cry), the great and lesser spotted woodpeckers. It builds in the hollows of trees and feeds on insects which it obtains from the trunk of trees by digging into the wood, for which purpose it has a strong chisel-shaped beak and a tongue which it can shoot out to catch the insects. The metallic drumming sound made by the birds in spring is thought to be caused by their beaks hammering away at some hard resounding substance.

Wood's Metal, an alloy with a very low melting point (65° C., which is under 150° F.) so that a

spoon made of it will melt when used to stir a cup of tea. Contains bismuth 4 parts, lead 2 parts, tin 1 part, cadmium 1 part.

Wool has been largely grown and used in the manufacture of cloth in England since before the Roman invasion. It is grown on the backs of sheep, and is of various kinds, according to the breed of sheep from which it is derived. Wool differs from hair in that it has a wavy, serrated fibre, its curl being a notable characteristic, whereas hair has a smooth surface comparatively free from serratures. Long wools are mostly used for the manufacture of worsted goods, and short wools for woollen cloths, though the improvements in machinery in recent years have enabled manufacturers to utilise short wools to a great extent for dress fabrics as well as for woollens. The finest wools are obtained from the fleece of the Spanish merino sheep. Australia, New Zealand, and the Argentine are the greatest wool-producing countries.

Woolsack, the name given to the seat occupied by the Lord Chancellor in the House of Lords. It is a large square bag of wool, without back or arms, covered with red cloth. At the time when it was first used, in the reign of Edward III., wool was the great staple commodity of the country and, it is said, chosen for the seat of judges as a constant reminder of the main source of the national wealth. The Lord Chancellor is said to be "appointed to the woolsack."

Work is the transference or conversion of energy. Movement against resistance, the giving of acceleration to a body, or the change from one energy state into another, all require the expenditure of work. It is measured by the product of the force and the displacement of its point of application in the line of action in units of ft.-lb., erg, or joule. The ft.-lb. is the work done in moving 1 lb. through 1 ft. The erg, the unit in the c.g.s. system, is the work done by a force of 1 dyne acting through a distance of 1 cm. and the joule is the work done in 1 second by a current of 1 ampere flowing through a resistance of 1 ohm, equal to 10^7 ergs, 1 watt-second or 0·737 ft.-lb. In a rotating body work done is measured by the product of the moment and the angular displacement.

Worsted, a fabric made from long wools or wools mixed with cotton or other fibrous material. It was first manufactured at, and derived its name from, Worstead in Norfolk, in the 14th century. Norwich was, until the latter part of the 18th century, the headquarters of this industry, but now for more than 100 years the worsted manufacturing centre has been Bradford.

Wren, a class of small passerine birds possessing upturned tails and most abundant in South America. The British species is an interesting singing bird with a surprisingly loud note for its size.

Wryneck, a tree-creeping bird related to the woodpecker, of grey-brown plumage. It is a summer visitor to Britain, and gains its name from the snake-like way it curves its neck.

X

Xenon a rare element, occurring in minute quantities in the atmosphere, grouped with the inert gases helium, neon, argon, krypton, and radon; discovered by Sir William Ramsay and M. W. Travers in 1898.

Xoanon, the name given to sculptured wooden images of the time of the ancient Greeks.

X-Rays were discovered in 1895 by Professor Röntgen, of Wurzburg, while experimenting with a Crookes vacuum tube, when the fact was accidentally revealed that a photographic plate, contained in a dark box and exposed to its rays, was affected. To the X-rays the box was transparent. X-ray photographs are now commonly taken to obtain information about objects enclosed within solid bodies; they enable bullets and any solid bodies of metal, as well as bones, etc., in the body to be perfectly located and investigated. The discovery has proved of great advantage in surgical operations. *See* **F11** (1), **60** (2).

Xylem, the woody tissue of higher plants. The function of the xylem is to conduct water and mineral salts upwards, and to provide mechanical support.

Xylograph, the name given to an engraving on wood or an impression thereof.

Xylophone, a musical instrument consisting of a series of tuned wooden bars of varying dimensions. It is played by striking the bars with wooden hammers held in the hands.

Y

Yacht, a light vessel now much used for pleasure trips and racing. The first yachting club was the Cork Harbour Club, started about 1720; and in 1812 the Royal Yacht Squadron was founded at Cowes. The Royal Thames Yacht Club dates from 1823. The most famous international yachting trophy is *The America's Cup*, which was won by America in every contest between 1851 and 1937, and again in 1958. The most famous English challengers were Sir Thomas Lipton and T. O. M. Sopwith.

Yak, a curious, long-haired ox, found in Tibet, and there employed as a beast of burden.

Yale University was established in 1701, and is one of the leading universities of the United States. It received its name from Elihu Yale, who endowed it largely in 1716.

Yam, the root of the 150 species of *Dioscorea*, which grows in Asia, America, Africa, and Australia; used as a substitute for the potato, roasted or boiled. It also furnishes a flour for bread or pudding making.

Yard, a standard measure of 36 in., the word being derived from the Saxon gyrd, or rod. The yard was anciently regarded as the circumference of the body, but Henry I. decreed it should be the length of his arm.

Yarn is the textile thread or fibre spun into the form of weft or warp ready to be woven into fabrics.

Yawl, the jolly boat of a ship; also the name given to any small yacht of the cutter class.

Year. (*See* **Calendar.**)

Yearling, a young horse or other animal in the second year of its age.

Yeast, a unicellular fungus which sets up fermentation. In brewing and wine-making the yeasts are important. The baker uses yeast to make bread rise; yeast is incorporated in the dough and ferments some of the starch present, yielding carbon dioxide gas which expands and aerates the bread in the baking process.

Yellowhammer, a common British bird of the bunting family, of lemon-yellow and brown plumage. Nests on or near the ground.

Yeomen of the Guard are a body of Foot Guards established in the reign of Henry VII. for the protection of the Royal Person. Yeomen are now about 100 in number, and their duties consist in being present on ceremonial State occasions, the yearly distribution of Maundy Money, and the searching of the vaults of the Houses of Parliament on Guy Fawkes' day. "Beefeater" is the nickname of both Yeomen of the Guard and Yeomen Warders of the Tower, and they both wear the style of dress of the Tudor period, but with one distinction, the Yeomen of the Guard wear a cross belt, the Warders do not.

Yew, an evergreen tree, the wood of which was in former days in very great demand for bow-making.

Yoga, one of the leading systems of Hindu philosophy which proclaims the emancipation of the soul through union with the universal spirit.

Yogi, a Hindu religious ascetic who practises Yoga.

York Minster, one of the oldest and finest of English cathedrals, is 524 ft. long, its nave is 240 ft broad, and the central tower is 16 ft. high The present edifice, in parts, dates back to the 12th century, but a church stood on the site in the 7th century. In 1829 it was set on fire by a lunatic named Jonathan Martin, and the destruction that then took place cost £60,000 to restore.

Ytterbium, a chemical element discovered by Urbain in 1907. It is one of the group of rare earth metals.

Yttrium, a chemical element discovered by Mosander in 1842. It is found in a few rare minerals such as gadolinite, xenotine, fergusonite, and euxenite. One of the group of rare-earth metals.

Z

Zaibatsu, great and powerful family trusts, including the Mitsui, Mitsubishi, Sumitomo, and Yasuda, who held a position of unparalleled influence in Japan before the second world war, for in their hands was concentrated almost the entire economy of the Japanese nation. It was a major war aim of the Allies to break these trusts, but their economic power has been largely restored.

Zamboni Pile, a dry galvanic battery, which can provide small amounts of high-voltage current over a very long time. At Oxford a couple of Zamboni Piles have kept a bell ringing for over a hundred years. These Piles in the second world war were perfected and produced in quantity, being the most convenient source of current for infra-red signalling devices.

Zebra, an African quadruped of whitish-grey colour, with regular black stripings, perhaps the most beautiful member of the Equine family. Rather larger than an ass and smaller than the horse, it has a tufted tail, is of light build, wild, and fleet of foot; there are several species, and the Quagga and Burchell's Zebra (ground colouring yellow), as well as the True Zebra, belong to the group.

Zebu, a species of oxen having a large hump on the shoulder and short horns. In India and some parts of Africa these animals are domesticated and used as beasts of burden. They are of a light grey colour and very docile. Their flesh makes good food-meat; the Hindus, however, do not slay them but regard them with much veneration.

Zend-Avesta, the name given to ancient sacred books of the Zoroastrians or Parsees. They originally numbered twenty-one, but only three survive.

Zenith, the highest point in the heavens above an observer's head, the opposite pole to the Nadir.

Zeriba, *or* **Zareeba**, a military enclosure of prickly brushwood, used by the British in Egypt in 1884.

Zero, the cypher signifying nothing. The West is indebted to the Arabs for it, who probably got it from the Hindus and passed it to European mathematicians towards the end of the Middle Ages. The Greeks had no such symbol, which hindered the development of their mathematics. The use of zero led to the invention of decimal fractions and to the later developments in astronomy, physics and chemistry. Absolute zero on the temperature scale is the lowest temperature theoretically possible (when no heat whatever is present) and equal to $-273{\cdot}15°$ C.

Zeta, the name given in former times to the closet or room, above a church porch, where the sexton lived and guarded the documents of the church. Zeta is also the name of the machine at Harwell (zero energy thermometer assembly) designed to solve some of the problems of thermonuclear reactions. *See* **F51** (2).

Zinc, a familiar metal, known to the ancients, and used by them in the making of brass. It occurs as the sulphide, carbonate, etc. The ores of zinc are crushed, roasted, and reduced with coal. In combination with copper it constitutes the familiar alloy called brass, and zinc itself is much used for roofing and other protective purposes. Zinc ores are mined in Canada, the U.S.A., Mexico, Poland, Australia, Russia, Italy, Spain, and many other parts of the world. Zinc smelting is carried on in most industrial countries, including Great Britain.

Zion, Protocols of. These are a series of lectures purported to have been given by an "elder of Zion" revealing a Jewish plot for international domination. They have been extensively published in Europe since 1900, but conclusive evidence was produced in 1921 to show they were a forgery.

Zionism, the name of the movement, whose object has been to re-establish a Jewish National Home in Palestine. The movement was founded in 1897 by Theodor Herzl, a Viennese journalist and playwright. The Balfour Declaration promising facilities for the realisation of its objects was issued by the British Government in 1917. Thanks to the activity of the Zionist Organisation, largely under the leadership of Chaim Weizmann, the Jewish population in Palestine has considerably increased and many agricultural settlements have been established in various parts of the country. The Hebrew University was inaugurated in 1925, and great developments have taken place in all branches of industrial and commercial activity as well as in agriculture. Until 1948, when Britain handed the mandate to U.N.O., the country was administered by a High Commissioner appointed by the British Government. Since then the Jews have proclaimed a State of Israel and the Zionists' aims have been realised.

Zirconium was discovered by Klaproth in the sand of the rivers of Ceylon in 1789. The crystalline metal is white, soft, and ductile; in its amorphous condition it is a blue-black powder Zirconium is used in atomic reactors.

Zither, an ancient musical instrument consisting of strings stretched on a frame which is held in the left hand. The right hand plucks the strings with a plectrum.

Zodiac, an imaginary zone or belt of the sky enclosing the circuit over which the principal planets travel. It is divided into 12 equal spaces of 30 degrees each, comprising respectively the 12 signs of the zodiac—Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius and Pisces. The idea of the zodiac originated with the Babylonians about 2000 B.C. and passed by way of the Greeks to the Western world.

Zodiacal Light, a faint cone of light occasionally seen stretching along the zodiac from the western horizon after evening twilight or the eastern horizon before morning twilight. It is believed to be due to the scattering of the sun's light by some rare gas which extends outwards from the sun and rotates round it.

Zollverein, any of the customs unions successively formed under the leadership of Prussia among certain German states for maintaining uniform duties and tariffs against foreign countries and free trade among themselves. The administration was finally merged in the German Empire of 1871.

Zonda, a warm moist wind in Argentina of great velocity blowing from the north or northwest, and, like the Sirocco in Southern Europe, causes much discomfort. It happens when a depression is moving across the pampas, bringing with it a mass of air from the humid tropics. It is followed by a refreshing wind from the south-east.

Zone, an imaginary geographical belt encircling the earth. There are five zones—the Torrid Zone, from tropic to tropic; two Temperate Zones, from the tropics to the Polar Circles; and two Frigid Zones, from the Polar Circles to the North and South Poles respectively.

Zoological Gardens of London were opened in 1828, and belong to the Zoological Society of London. They contain one of the largest and most varied collections of living animals in the world. The Society maintains an open-air zoo at Whipsnade, on the edge of Dunstable Downs; this was opened in 1931.

Zoology, the science of animal biology, treating of the structure, classification, and distribution of the various members of the animal kingdom.

Zoophyte, the name applied to invertebrate animals which have a plant-like appearance or mode of growth, *e.g.*, sea anemones, corals, sponges. The term Zoophyta was used in old classifications to include all such animals, but is now obsolete.

Zouaves, a body of French soldiers first organised in Algeria, and then consisting exclusively of Berber natives. As now constituted, the Zouave regiments are almost exclusively French.

Zulus, a native African people occupying Zululand, which later became part of Natal, Union of S. Africa. They are a brave race, and in a war with Great Britain in 1879 inflicted severe defeats upon our troops. The Zulu king, Cetewayo, was finally defeated and taken prisoner, and his country annexed.

NOBEL PRIZE WINNERS (1901–1959)

These prizes, founded by the will of Dr. Alfred B. Nobel (1833–96), are five, and are awarded each year for the most important discovery or development in (1) physics, (2) chemistry, (3) physiology and medicine, (4) the most distinguished literary work, (5) the best effort towards the promotion of peace.

Year.	Physics.	Chemistry.	Physiology and Medicine.	Literature.	Peace.
1901	W. C. Roentgen (G).	J. H. van't Hoff (D).	E. v. Behring (G).	R. F. A. Sully Prudhomme (F).	H. Dunant (Sw), F. Passy (F).
1902	H. A. Lorentz (D), P. Zeeman (D).	E. Fischer (G).	R. Ross (B).	T. Mommsen (G).	E. Ducommun (Sw), A. Gobat (Sw).
1903	H. Becquerel (F), P. Curie (F), Marie Curie (F).	S. Arrhenius (S).	N. R. Finsen (Da).	B. Björnson (N).	Sir W. R. Cremer (B).
1904	Lord J. W. S. Rayleigh (B).	W. Ramsay (B).	I. P. Pavlov (R).	F. Mistral (F), J. Echegaray (Sp).	Institut de Droit International.
1905	P. Lenard (G).	A. v. Bayer (G).	R. Koch (G).	H. Sienkiewicz (P).	Bertha von Suttner (Au).
1906	J. J. Thomson (B).	H. Moissan (F).	C. Golgi (I), S. R. y Cajal (Sp).	G. Carducci (I).	T. Roosevelt (A).
1907	A. A. Michelson (A).	E. Buchner (G).	C. L. A. Laveran (F).	Rudyard Kipling (B).	E. T. Moneta (I), L. Renault (F).
1908	G. Lippmann (F).	E. Rutherford (B).	P. Ehrlich (G), E. Metchnikoff (R).	R. Eucken (G).	K. P. Arnoldson (S), F. Bajer (Da).
1909	F. Braun (G), G. Marconi (I).	W. Ostwald (G).	T. Kocher (Sw).	S. Lagerlöf (S).	A. M. F. Beernaert (Be), Baron d'Estournelles de Constant de Rebecque (F).
1910	J. D. van der Waals (D).	O. Wallach (G).	A. Kossel (G).	P. Heyse (G).	The Bureau International Permanent de la Paix, Berne.
1911	W. Wien (G).	Marie Curie (F).	A. Gullstrand (S).	M. Maeterlinck (Be).	T. M. C. Asser (D), A. H. Fried (Au).
1912	G. Dalén (S).	V. Grignard (F), P. Sabatier (F).	A. Carrel (A).	G. Hauptmann (G).	E. Root (A).
1913	H. Kamerlingh Onnes (D).	A. Werner (Sw).	C. Richet (F).	R. Tagore (In).	H. la Fontaine (Be).
1914	M. v. Laue (G).	T. W. Richards (A).	R. Bárány (Au).	—	—
1915	W. H. Bragg (B), W. L. Bragg (B).	R. Willstaetter (G.).	—	R. Roland (F).	—
1916	—	—	—	V. von Heidenstam (S).	—
1917	C. G. Barkla (B).	—	—	K. Gjellerup (Da), H. Pontoppidan (Da).	Comité International de la Croix-Rouge, Geneva.
1918	M. Planck (G).	F. Haber (G).	—	—	—
1919	J. Stark (G).	—	J. Bordet (Be).	C. Spitteler (Sw).	W. Wilson (A).
1920	C. E. Guillaume (F).	W. Nernst (G).	A. Krogh (Da).	K. Hamsun (N).	L. Bourgeois (F).
1921	A. Einstein (G).	F. Soddy (B).	—	A. France (F).	K. H. Branting (S), C. L. Lange (N).
1922	N. Bohr (Da).	F. W. Aston (B).	A. Hill (B), O. Meyerhof (G).	J. Benavente (Sp).	F. Nansen (N).
1923	R. A. Millikan (A).	F. Pregl (Au).	F. G. Banting (C), J. R. Macleod (C).	W. B. Yeats (Ir).	—
1924	M. Siegbahn (S).	—	W. E. Einthoven (D).	W. Reymont (P).	—
1925	J. Franck (G), G. Hertz (G).	R. Zsigmondy (G).	—	G. B. Shaw (B).	Sir A. Chamberlain (B), C. G. Dawes (A).
1926	J. Perrin (F).	T. Svedberg (S).	J. Fibiger (Da).	G. Deledda (I).	A. Briand (F), G. Stresemann (G).
1927	A. H. Compton (A), C. T. R. Wilson (B).	H. Wieland (G).	J. Wagner-Jauregg (Au).	H. Bergson (F).	F. Buisson (F), L. Quidde (G).
1928	O. W. Richardson (B).	A. Windaus (G).	C. Nicolle (F).	S. Undset (N).	—
1929	L. de Broglie (F).	H. v. Euler-Chelpin (S), A. Harden (B).	C. Eijkman (D), F. G. Hopkins (B).	T. Mann (G).	F. B. Kellogg (A).
1930	C. V. Raman (In).	H. Fischer (G).	K. Landsteiner (Au).	S. Lewis (A).	L. O. J. Söderblom (S).
1931	—	F. Bergius (G), K. Bosch (G).	O. Warburg (G).	E. A. Karlfeldt (S).	Jane Addams (A), N. M. Butler (A).
1932	W. Heisenberg (G).	I. Langmuir (A).	C. S. Sherrington (B), E. D. Adrian (B).	J. Galsworthy (B).	—
1933	P. A. M. Dirac (B), E. Schroedinger (Au).	—	T. H. Morgan (A).	Bunin (R).	Sir Norman Angell (B).

NOBEL PRIZE WINNERS (1901–1959), *continued*

Year.	Physics.	Chemistry.	Physiology and Medicine.	Literature.	Peace.
1934	—	H. C. Urey (A).	G. Minot (A), W. Murphy (A), G. Whipple (A).	L. Pirandello (I).	Arthur Henderson (B).
1935	J. Chadwick (B).	F. Joliot (F), I. Joliot-Curie (F).	H. Spemann (G).	—	C. von Ossietzky (G).
1936	V. F. Hess (Au), C. D. Anderson (A).	P. Debye (D).	Sir H. H. Dale (B), O. Loewi (G).	E. O'Neill (A).	C. de S. Lamas (Ar).

Literary Companion

TABLE OF CONTENTS

English Verse

This section of the *Cyclopaedia* is concerned with English verse since the time of Chaucer, with its different metres and rhymes. The poet's subtle verse patterns of metre and rhyme are indeed one of his most potent means of expression, and by keeping an attentive ear to them we are helped to catch his meaning.

A glance at any good anthology of English poems written during the last five or six centuries will show what a rich variety of traditional verse patterns the contemporary poet now has at his disposal, whatever may be his mood or theme. Our poet laureate, Masefield, has made great use of these time-honoured forms. For his leisurely "Dauber," he employs the stately "rhyme-royal" stanza that was no longer new even to Chaucer. His sonnets are of Shakespearean design, and for his brisk "Reynard the Fox" he uses the octosyllabic couplet in which the Puritan poet, Marvell, once hymned the newly discovered "remote Bermudas."

Many poets, however, find the traditional forms are not sufficiently flexible for modern needs, and they may so drastically modify them as to make them, at first sight, unrecognisable.

One of the most indefatigable experimenters has been Dame Edith Sitwell. In the notes to the Penguin selection of her poetry she says:

> "At the time I began to write, a change in the direction, imagery, and rhythms in poetry had become necessary, owing to the rhythmical flaccidity, the verbal deadness, the dead and expected patterns, of some of the poetry immediately preceding us.
>
> "Rhythm is one of the principal translators between dream and reality. Rhythm might be described as, to the world of sound, what light is to the world of sight. It shapes and gives new meaning."

Placing so high a value on rhythm, Edith Sitwell sets herself, in her early "Façade," to tireless experiment in the effect on rhythm or metre of all kinds of subtle devices in the use of sound, until, as she says, her experiences led to the poem "Gold Coast Customs." This poem, written in 1929, is "about the state that led up to the second World War," and is prophetic in its vision of

"That sick thick smoke from London burning."

When we first read "Gold Coast Customs" we are shocked and and stunned by this portrayal of the ruthless and heartless savagery of our so-called civilisation. The shock is driven home by the metre, a savage staccato of stabbing lines, that echoes the fevered heart-beat of those indifferent to poverty and suffering, of the "rich man Judas, brother Cain." It also echoes "the beating of the drums that heralded the Customs, as they were called, in Ashantee, a hundred years ago, when, at the death of any rich or important person, slaves and poor persons were killed so that the bones of the dead might be washed by human blood."

Only when we recover from our shock and look carefully at the verse, do we realise that this blood-curdling metre, apparently entirely new, is written according to age-long principles, and uses for the most part an irregular tattoo of the iambs and anapæsts that are the ground beat of most of our finest verse.

As Day Lewis has said in the Preface to the Penguin selection of his poems:

> "We must never think of 'modern poetry' as something in a vacuum, or something that started in 1900 or 1917 or 1930. Every good poem has grown out of the compost of all the poetry ever written."

Of his own poems Day Lewis goes on to say, "Contrary to received opinion about modern verse, nearly all my poems 'rhyme and scan,'" and the same may be said of most of our highly original contemporary poetry, such as that of W. H. Auden or Dylan Thomas.

The poet's intensely individual music is played on the age-old instrument of metre and rhyme, and the better we understand the instrument, the keener will be our enjoyment of the poet's skill and genius.

Even verse that cannot be called poetry—verse that is mechanical, uninspired, lacking that intensity of insight and expression that we recognise as poetic—even this mediocre verse can teach us something of the poet's instrument. A homely nursery rhyme like "Humpty Dumpty" can help us to appreciate the metre of Ariel's unearthly song, "Where the bee sucks."

It is for this reason that the following guide to versification throws its net wide, gathering together for our consideration patterns as diverse as those of the mediæval ballad and the modern Frenchified triolet, of the flippant clerihew, and the grave blank verse of Wordsworth's "Prelude."

Reference

The following account of our verse is illustrated by quotations and by constant reference to the numbered poems in the new edition of "The Oxford Book of English Verse," 1939.

Thus "OBEV 16" means "Oxford Book of English Verse," New Edition, Poem No. 16.

I. INTRODUCTION. STRESS, METRE, AND RHYME.

If we listen carefully to spoken English, we shall observe that there is a natural tendency to stress some syllables more than others. In the following sentence, for example, the greater stress normally falls on the syllables whose vowels are marked with an acute accent, which is the usual way of indicating stress.

"The expréss léft Mánchester at séven."

It is obvious that in this sentence the stress falls in a quite haphazard way, and it is for this reason that we recognise the sentence as prose, for the essential difference between English prose and verse is that in prose the stress falls at random, while in verse the stressed syllables occur according to some regular pattern.

If we mark the stressed syllables in the following line from Wordsworth,

"And lóud hallóos and scréams and échoes lóud,"

it is immediately clear that the stress occurs regularly. The line is in fact, composed of a simple stress pattern of an unstressed syllable followed by a stressed (*e.g.*, and lóud) which is repeated throughout.

It is a regular pattern of stress, such as this, that in English verse constitutes what we call "metre." Metre in Greek means simply "measure," and it is always by stress that we measure our verse.

Another feature that distinguishes our verse from prose is the use of rhyme, although rhyme, unlike metre, is not essential to verse.

II. METRE.

Different Kinds of Feet.

In English verse the unit of stress pattern constitutes a foot, the foot of verse being comparable to the bar of music.

English verse uses several kinds of feet, some of two syllables, or disyllablic, some of three syllables or trisyllabic, and occasionally a foot of four syllables.

Disyllabic feet are of four kinds:

The Iamb, consisting of an unstressed syllable followed by a stressed, *e.g.* "retúrn."

The Trochee, consisting of a stressed syllable followed by an unstressed, *e.g.*, "river."

The Spondee, consisting of two stressed syllables, *e.g.*, "dóor mát."

The Pyrrhic, consisting of two unstressed syllables, *e.g.*, in the phrase "into tówn," "into" is a pyrrhic.

Trisyllabic feet are of four kinds:

The Anapæst, consisting of two unstressed syllables followed by a stressed, *e.g.*, "as you wish."

The Dactyl, consisting of a stressed syllable followed by two unstressed, *e.g.*, "árchery."

The Amphibrach, very rarely used, consisting of a stressed syllable between two unstressed, *e.g.*, "delíghted."

The Tribrach, still more rare, consisting of three unstressed syllables, *e.g.*, last three syllables of "incommúnicable."

A four-syllabled foot is very occasionally found:

The Choriambus, which may be thought of as a trochee followed by an iamb, *e.g.*, "Tóll for the bráve."

Different Kinds of Metrical Line.

Based on the different kinds of feet are the different kinds of English metre, which may be compared with the "time" in music.

Disyllabic metres may be either iambic or trochaic, for it is impossible to speak at any length using only pyrrhic or spondees, and the most common trisyllabic metres are anapæstic or dactyllic. Examples of different kinds of metrical line follow.

Iambic Line.

"I stróve with nóne for nóne was wórth my
strífe."
[OBEV 584]

Trochaic Line.

"Hóme art góne and tá'en thy wáges."
[OBEV 150]

Anapæstic Line.

"With a héy and a hó and a héy noninó."
[OBEV 147]

Dactylic Lines.

"Wít with his wántonness,
Tásteth death's bítterness."
[OBEV 177]

Amphibrach Lines.

"Most fríendship is féigning, most lóving mere
fólly
Then héigh ho, the hólly!
This life is most jólly."
[OBEV 146]

Choriambic Line.

"Kéntish Sir Býng stóod for his Kíng."

Variations in Metre.

Satisfying poetry is rarely entirely regular. Mechanical regularity is soon wearisome to the ear and is a characteristic of doggerel. The poet satisfies our love of rhythm in a more interesting and subtle way by introducing all kinds of variations and inversions, while at the same time maintaining the throb of the basic metre. An account of the chief variations follows.

Elision.

Elision is the suppression in pronunciation of a vowel or a syllable.

In the anapæstic line,

"The Assýrian came dówn like a wólf on the fóld"

the second foot appears to have four syllables, but in fact the "i" of "Assýrian" is elided or dropped before the "a" as shown by the little bracket. The elision of "i," which is pronounced "y" and known as "consonantal y," is especially common, and occurs in such words as "familiar," "opinion." Elision is often shown by the use of the apostrophe as in "heav'n." In "heav'n" we see one of the many conventional elisions of poetry, like "'tis," "'twas," "did'st," "o'er," "e'er," "'gainst," and many more.

Substitution.

Substitution is the use of a foot different from that of the metre in which the poem is written. In the following examples we can see the effect on iambic verse of some common substitutions.

Of a Trochee.

"Stíffen the sínews, súmmon úp the blóod."
Shakespeare, "Henry V."

Here the initial trochee gives force and emphasis.

Of a Spondee.

"Rócks cáves, lákes féns, bógs déns and shádes
of déath."

In this extraordinary line of Milton's the spondees slow down and weight the verse.

Of a Pyrrhic.

"They flý forgótten as a dréam"

Here the pyrrhic in the third foot gives lightness to the line.

Of a Dactyl.

"Cháttering his téeth for cóld that díd him chill."

When a dactyl replaces an iamb it is usually in the first foot as in this typical instance from Spenser, where the dactyl gives emphasis and variety to the line.

Of Anapæsts.

"And the cóming wind did róar more lóud
And the sáils did sígh like sédge."
[OBEV 562]

The initial anapæsts in these two lines from "The Ancient Mariner" give an effect of hurry and speed.

Additional Syllable.

An additional syllable may be added to either the beginning or end of a line.

Feminine Ending.

A feminine ending is an extra unstressed syllable that is added after the final stressed syllable of a line, giving a gentle falling inflexion. It is often used in blank verse and is a marked characteristic of Shakespeare's later plays, *e.g.*,

" Be not afear'd; the isle is full of noises,
Sounds and sweet airs that give delight and hurt not."

Anacrusis.

Anacrusis is the use of an extra syllable before the first regular foot of the line.

Dropped Syllable.

It sometimes appears that a line is a syllable, or syllables, short, until we realise that a suspense or pause occupies the time that would have been taken by the missing syllable. The dropped syllable can be indicated by the "caret" mark, thus ^. The following technical terms are used for lines that are short of syllables.

Catalectic Line.

This leaves off in the middle of the last foot, as in the trochaic line

" Ẽver lét the fáncy róam,"

or the dactylic line,

" Rings on her fíngers and bélls on her tóes."

The catalectic line is common in trochaic and dactylic verse, for it is in keeping with the tendency of English verse to end on a stressed syllable.

Acephalous Line.

This omits the first syllable of the line, as in the anapæstic line,

" That hóst with their bánners at súnset were séen."

The Cæsura.

The cæsura is a special kind of pause, quite different from that which indicates a dropped syllable. It is a pause about the middle of a line and is usually indicated by a pause in the sense, *e.g.*,

" Both hungered after death; both chose to win or die."

Two Ways of Describing Metre.

The Classical.

The actual names that we have been using for the different kinds of feet and metres are derived from Greek. It is most important, however, to realise that in the classical languages they had a different meaning, for Greek and Latin verse was written on a quite different principle from ours, and was scanned according to the "quantity" or length of the syllable, and not according to stress. Thus an iamb in Greek and Latin consisted of a short syllable followed by a long, marked thus, ⏑ –, and a trochee of a long syllable followed by a short, marked – ⏑.

In English verse the length of the syllable is totally irrelevant. For instance, the line,

" Pólly pút the kéttle ón and léts have téa "

begins with five trochees, all consisting of two *short* syllables.

The application of Greek words to English metres is confusing only if we forget that in English verse the criterion is stress.

The Modern.

Some writers, however, prefer new ways of describing our verse, and the most popular method is set out below:

A foot is called a period.
A disyllabic metre is called duple or double time.
A trisyllabic metre is called triple time.
A period with the stress on the first syllable is said to be falling.
A period with the stress on a second or third syllable is said to be rising.

III. RHYME.

Another thing that gives a formal pattern to English verse, and distinguishes it from prose, is rhyme. It is not essential to our verse, much of our verse being rhymeless.

Rhyme is a similarity in sound in words occurring normally at the ends of lines. In true rhyme the last stressed syllable and consonants following it are the same, while the sounds preceding the stressed vowel are different, *e.g.*, "cage/page," "pleasure/treasure."

The Types of Rhyme.

The most familiar division of rhyme is into masculine, feminine, and triple rhyme, but we also distinguish broken and Leonine rhyme.

Masculine, Male, or Single Rhyme.

The final syllable is stressed, *e.g.*, "cage/page," "joy/boy."

Feminine, Female, or Two-syllabled Rhyme.

The syllable before the last is stressed, and the final syllable unstressed, *e.g.*, "pleasure/treasure," "bending/lending."

Triple or Tumbling or Three-syllabled Rhyme.

The antepenultimate syllable is stressed. Triple rhyme is normally found in light or comic verse, like that of W. S. Gilbert or in this punning "Epitaph on a Dentist.":

" Stranger! Approach this spot with gravity!
John Brown is filling his last cavity."

In "The Bridge of Sighs" [OBEV 662] Hood dares to use it in a serious poem with such rhymes as "scrútiny/mútiny."

Broken Rhyme.

Broken rhyme, where more than one word is needed to complete the rhyme, is occasionally used, *e.g.*, "estate/their gate."

Leonine Rhyme.

Although rhyme normally occurs at the end of the line, we also find verse where the first half of the line rhymes with the second. This device, known as Leonine rhyme, is frequently used in Coleridge's "Ancient Mariner" [OBEV 562], *e.g.*,

" The ice did split, with a thunder-fit."

Poetic Licence in Rhyme.

The difficulty of rhyming in English is considerable, for many words have not a single rhyming word, some have only one, others very few. Certain licences are therefore allowed to the poet in the following ways:

Eye Rhyme or Printers' Rhyme.

Here words rhyme only to the eye, as "love/move." Keats in "Meg Merrilies" uses "rushes/bushes."

Identical Rhyme.

Here the same syllable or word is used twice so that the line rhymes with itself, *e.g.*, "part/impart" [OBEV 562], "universe/this verse" [OBEV 617]. The use of rhyming words spelt differently but pronounced identically is also a poetic licence, *e.g.*, "wright, write, right."

Cockney Rhyme.

Keats' use of Cockney rhymes has been much criticised, *e.g.*, "mourn/torn," "faces/vases," "briar/attire." There is still considerable difference between Northern and Southern pronunciation of English, and many eminent poets have availed themselves of a Southern pronunciation in rhyming "dawn/morn," although in the North of England the "r" of "morn" would be sounded.

Assonance.

Assonance is sometimes used instead of rhyme, and occurs frequently in early folk poetry and less formal verse. It consists in a similarity in the accented vowels and those which follow, but not in the consonants, *e.g.*, "feet/creep," "skin/swim."

Perversion of Rhyme.

Modern poets, following Wilfrid Owen, have sometimes used a deliberate perversion of rhyme, which should not be confused with assonance. Wilfrid Owen opens his bitter poem "A Terre" with the following stanza:

"Sit on the bed. I'm blind and three parts shell.
Be careful; can't shake hands now; never shall.
Both arms have mutinied against me,—brutes.
My fingers fidget like ten idle brats."

The deliberate falsity of rhymes like "shall/shell," and "brutes/brats" conveys Owen's horror at the disintegration and collapse of the First World War.

Recording of Rhyme Schemes.

The conventional way of noting rhyme schemes is to call the first series *a*, the second *b*, and so on. Normally each new series is indented, *e.g.*,

"Joyful, joyful!	*a*
When virginity	*b*
Seeks all coyful	*a*
Man's affinity.	*b*
Fate all flowery,	*c*
Bright and bowery	*c*
Is her dowery!	*c*
Joyful, joyful."	*a*

W. S. Gilbert, "Yeomen of the Guard."

IV. THE STANZA.

Some poems are divided into groups of lines, which strictly speaking are called "stanzas," though in popular language they are often known as "verses." Generally the stanzas of a poem are uniform, but sometimes they are varied as in Milton's "Lycidas" [OBEV 325].

V. ENGLISH VERSE FORMS.

English poetry uses an immense wealth of verse forms, distinguishable from each other by the predominating metre and also by the pattern of rhyme and the kind of stanza—or by the absence of rhyme and stanza. An account of these follows.

Iambic Metres.

The metre most natural to the English language is undoubtedly the iambic.

With Iambic Pentameter as Basis.

The iambic pentameter of five stresses and ten syllables, also called the iambic decasyllabic line, is more used than any other, and is the basis of the following forms.

Blank Verse. Blank verse, consisting of unrhymed iambic pentameters, is the metre of Shakespeare's plays, Milton's "Paradise Lost," Wordsworth's "Prelude," and Tennyson's "Idylls of the King." In the hands of such masters it is a most flexible instrument, especially when diversified with the eleven-syllabled line with a feminine ending. Shakespeare used the metre with increasing freedom, though it must be remembered that some apparent variations are due to the different pronunciation of Elizabethan times.

The following lines of blank verse occur in Wordsworth's "Prelude," Book III. He is describing his rooms in St. John's College, Cambridge.

"And from my pillow, looking forth by light
Of moon or favouring stars, I could behold
The antechapel where the statue stood
Of Newton with his prism and silent face,
The marble index of a mind for ever
Voyaging through strange seas of Thought, alone."

Heroic Couplet. The heroic couplet, consisting of iambic pentameters rhyming in pairs, was in Elizabethan times called "riding rhyme," possibly because it is the metre of The Prologue of Chaucer's "Canterbury Tales," and of many of the tales themselves. It became the most fashionable metre of the eighteenth century when it was used by Pope, Goldsmith, and Johnson. Keats later employed it in "Lamia."

The *Closed Couplet* was, in the heyday of the couplet's vogue, considered the most polished and correct. Here the sentence form exactly coincides with the couplet and the rhyme has a clinching effect, *e.g.*,

"True ease in writing comes from art, not chance,
As they move easiest who have learned to dance."

Pope was the supreme master of the closed couplet, and eschewed variations such as enjambement, or the Alexandrine.

Enjambement is a variation used by poets before Pope's time and revived by the Romantic poets. In enjambement the sentence flows over from one line or couplet to the next, and the click of the rhyme is submerged, *e.g.*, Keats' description of Lamia in her serpent form with skin of "dazzling hue."

"And full of silver moons, that, as she breathed,
Dissolv'd or brighter shone, or interwreathed
Their lustres with the gloomier tapestries."
Keats, "Lamia."

The Alexandrine, another variation, is a line of six iambic feet. Dryden made frequent use of the Alexandrine but Pope parodied it in the brilliant line that serves as a mnemonic.

"A needless Alexandrine ends the song,
That, like a wounded snake, drags its slow length along."

The triplet, another variation, consists of three lines rhyming together. The third line is frequently an Alexandrine.

Rhyme Royal. Rhyme royal has seven iambic pentameters, rhyming ABABBCC. Used by Chaucer in "Troilus and Cressida" [OBEV 14 and 15] and Shakespeare in "Lucrece," it was revived by Masefield in such poems as "Dauber."

Spenserian Stanza. The Spenserian stanza has eight iambic pentameters followed by an Alexandrine, rhyming ABABBCBCC. Invented by Spenser in "The Faerie Queene," it was used by Byron in "Childe Harold," Keats in "The Eve of St. Agnes," and Shelley in "Adonais."

Elegaic Stanza. The Elegaic stanza has four iambic pentameters, rhyming ABAB. It is also called the "heroic quatrain," quatrain meaning a four-lined stanza. This form is best known through Gray's "Elegy" [OBEV 465].

"Omar Khayyám" Stanza.

The "Omar Khayyám" stanza receives its name from its use by Fitzgerald in his translation of the "Rubaiyat." It has four iambic pentameters, rhyming AABA.

Ottava Rima. Ottava rima, also called the octave stanza, has eight iambic pentameters, rhyming ABABABCC. It was used by Byron in "Don Juan," and by Keats in "Isabella."

Terza Rima. Terza rima has stanzas of three iambic pentameters with a linking rhyme scheme: ABA, BCB, CDC, etc. The concluding stanza is rounded of with an extra line rhyming with its central line, *e.g.*, DEDE, constituting, in effect, a heroic quatrain. Used by Dante, the verse has been adapted by English poets. Shelley's "Ode to the West Wind" [OBEV 617] uses modified terza rima, the final rhymes being DEDEE.

The Sonnet. A sonnet has fourteen iambic pentameters. Perfected in Italy by Petrarch, who died in 1374, it was introduced into England in the sixteenth century. There are two chief types of sonnet.

The Petrarchan, or Italian, sonnet has an "octave" of eight lines, rhyming ABBAABBA, followed by a "sestet" of six lines, where some variety of rhyme schemes is found. The strictest Petrarchan sonnets have either two "tercets" of three lines each, with rhymes CDECDE, or else three pairs of lines rhyming CDCDCD.

An example of sestet rhyming CDECDE is Milton's "On His Blindness" [OBEV 327].

Examples of sestets CDCDCD are Wordsworth's "Upon Westminster Bridge" [OBEV 534] and Keats' "On First Looking into Chapman's Homer" [OBEV 641].

Not all of these examples observe the natural pause between octave and sestet which is characteristic of the strict Italian form, and many of our finest sonnets depart from the original rhyme scheme in both octave and sestet.

A lesser-known Petrarchan sonnet by Keats:

'To one, who has been long in city pent,
'Tis very sweet to look into the fair
And open face of heaven,—to breathe a prayer
Full in the smile of the blue firmament.
Who is more happy, when, with heart's content,
Fatigued he sinks into some pleasant lair
Of wavy grass, and reads a debonair
And gentle tale of love and languishment?
Returning home at evening with an ear
Catching the notes of Philomel,—an eye
Watching the sailing cloudlet's bright career,
He mourns that day so soon has glided by:
E'en like the passage of an angel's tear
That falls through the clear ether silently."

The *Elizabethan, or Shakespearean,* sonnet consists of three quatrains with the rhymes ABAB/CDCD/EFEF/ concluded by a couplet rhyming GG. The couplet often clinches the thought.

Examples are Shakespeare's sonnets [OBEV 155–174], and Keats' last sonnet [OBEV 644].

Other Iambic Metres.

Many of our iambic verse forms use a shorter or longer line than the pentameter.

The Octosyllabic Couplet. The octosyllabic couplet consists of lines of four stresses and eight syllables, and the lines rhyme in pairs. English poets like Marvell have used this metre effectively, *e.g.*, "A Garden" [OBEV 365, *see also* OBEV 367, 370]. It is the metre of Masefield's "Everlasting Mercy" and "Reynard the Fox."

The Ballad. There are two chief kinds of ballad metre.

(a) *Strict Ballad Form* consists of stanzas of four iambic lines, the first and fourth with four stresses, and the second and third with three, with the rhyme scheme ABCB. The fine old ballads "Sir Patrick Spens" [OBEV 381] and "The Wife of Usher's Well" [OBEV 388] are in this metre. Coleridge, in "The Ancient Mariner" [OBEV 562] shows how many varieties of stanza can be based on the simple ballad stanza.

"*Fourteeners*" is the name given to a form which is simply a re-arrangement of the ballad quatrain as a rhyming couplet of two iambic lines with seven stresses, as in Macaulay's "The Armada."

(b) *Less Strict Ballad Form, or Long Metre,* consists of stanzas of four iambic lines each with four stresses, the rhyme scheme being ABCB or ABAB. Many ancient ballads, such as "Thomas the Rhymer" [OBEV 379], are of this type.

"In Memoriam" Metre. This, the metre of Tennyson's "In Memoriam," is like the less strict ballad metre in having four iambic lines, each with four stresses, but its rhyme scheme is ABBA.

Short Metre. Short metre, rarely used, consists of iambic quatrains, each line having three stresses and the rhyme scheme being ABCB.

English Hymn Metres. Most English hymns are written in short iambic lines, and English hymnology names them according to the number of syllables. The most common are:

Common Metre, or 8686, with rhymes ABAB, *e.g.*, "O for a thousand tongues to sing" ["Songs of Praise" 595].
Long Metre, or 8888, with rhymes ABAB, *e.g.*, "When I survey the wondrous cross" ["Songs of Praise" 133].
Short Metre, or 6686, with rhymes ABCB, *e.g.*, "Blest are the pure in heart" ["Songs of Praise" 455].

Double Iambic Metre. When we are accustomed to hearing verse we come to realise that stresses are not always of equal weight. It is possible to distinguish in these "fourteeners" of Masefield a major stress, marked ˝ and a minor stress marked ´.

"Oh sőme are fónd of Spắnish wine, and sőme are fónd of Frĕnch,
And sőme'll swállow tắy and stúff fit ŏnly fór a wĕnch."

Masefield's "Captain Stratton's Fancy" [OBEV 939]

The lines have in fact four major stresses, and between the major stresses intervene three syllables, of which the middle has a minor stress. It is this alternation in the weight of the stress which gives its characteristic swing to such a poem as Chesterton's "The Rolling English Road" [OBEV 930].

Trochaic Metres.

Pure Trochaic Metre.

English poets seldom use a pure trochaic metre, partly because of the difficulty of rhyming, and partly because the continual feminine ending that it involves is not pleasing to the English ear. A few very short lyrics in this metre can be found, as Browne's Song "For her gait, if she be walking" [OBEV 251], but the only poem of any length is Longfellow's "Hiawatha," and the metre

of this *tour de force* tends to sound monotonous. It consists of unrhymed lines, each of four stresses, *e.g.*,

"Líke a yéllow léaf in áutumn
Líke a yéllow wáter-líly."

Modified Trochaic Metre.

Ever since the Middle Ages our poets have contrived to combine the advantages of a trochaic metre and of a masculine ending by the simple expedient of shortening the last foot of the line to a stressed monosyllable. This catalectic, or shortened, trochaic line is found both in couplets and in stanza forms. *The seven-syllabled trochaic couplet, also called the trochaic tetrameter*, consists of these catalectic, or shortened, lines rhyming in pairs, and is a gay, tripping measure, as in some passages of Milton's "L'Allegro" [OBEV 318].

"Háste thee nýmph and bring with thée
Jést and yóuthful Jóllity."

Keats uses the metre in "Bards of Passion," and "Fancy" [OBEV 637 and 638].

Lyrics in modified trochaic metre are often found. Herrick uses the seven-syllabled lines rhyming in pairs in "Cherry Ripe" and other lyrics [OBEV 264, 279, 280, 281]. Edmund Blunden, in "Forefathers" [OBEV 965], uses it in a stanza rhyming ABABCC. George Herbert in his lyric "Discipline" [OBEV 291] brilliantly combines five- and three-syllabled lines rhyming ABAB, *e.g.*,

"Thrów awáy Thy ród,
Thrów awáy Thy wráth;
Ó my Gód,
Táke the géntle páth."

Further Variations in Modified Trochaic Metre.

The modified trochaic line is especially subject to further variation.

(*a*) It is often combined with a pure trochaic line, *e.g.*, in Hunt's poem "Jenny Kiss'd Me" [OBEV 600] where the catalectic and the complete trochaic line alternate regularly.

(*b*) It often has an extra unstressed syllable preceding it (anacrusis), as in the second of these lines from Keats' poem "Fancy" [OBEV 638].

"Ín a dárk conspiracý
To | bánish Even fróm her ský."

The line that results might well be taken for iambic, and there are some passages in English poetry, such as lines in Milton's "L'Allegro" [OBEV 318], which can be described either as irregular trochaic or irregular iambic lines! It depends on what the hearer judges to be the *basic* stress.

Double Trochaic Metre.

Corresponding to double iambic metre there is a double trochaic metre. W. S. Gilbert effectively uses it in many of his patter songs, as in "Ferdinando and Elvira," *e.g.*,

"Thén we lĕt off páper crăckers, eách of which contáined a mŏtto,
Ánd she lĭstened while I rĕad them, till her mŏther tóld her nŏt to."

These lines, like those in double iambic metre, have four major stresses (marked ´), and between the major stresses three syllables, of which the middle carries a minor stress.

A modified double trochaic metre, where the last foot is shortened to a stressed monosyllable, can be recognised in Tennyson's "Locksley Hall," or in Lewis Carroll's verses in "Alice in Wonderland":

"'Wíll you wălk a little făster?' sáid a whĭting tó a snail."

Trisyllabic Metres Generally.

Because of the irregularities incident to verse in anapæsts, dactyls, and amphibrachs, it is not easy to distinguish one trisyllabic metre from another. Swinburne, the past master of trisyllabic metres, often passes with great freedom from anapæstic to dactylic lines within the same stanza.

Anapæstic Metres.

Pure Anapæstic.

Anapæstic metre is used only in short poems, and often conveys a sense of speed and urgency. The chief variation is the omission of one or two of the unstressed syllables at the beginning of a line. Some of the best-known examples of anapæstic verse are Byron's "Sennacherib," Flecker's "The War Song of the Saracens," and Lewis Carroll's parodies, "'Tis the voice of the lobster" and "You are old, Father William," from "Alice in Wonderland."

The Limerick.

The limerick may be defined as a single anapæstic stanza, having the first two lines of three feet, the next two lines of two feet and a concluding line of three feet, with the rhyme scheme AABBA.

The origin of the limerick is uncertain, but it became popular after the appearance in 1846 of Edward Lear's "Book of Nonsense." Lear's limericks differ from the contemporary type in that his final line is normally a repetition, adding nothing to the sense and repeating one of the previous rhyme words.

Most of our modern lyrics are passed on by word of mouth, but some that concisely express some intellectual attitudes have appeared in print, as the following, on "Determinism"—

"There wás a young mán who said 'Dámn!
It appéars to me nów that I ám
Just a béing that móves
In predéstinate gróoves,
Not a táxi or bús, but a trám.'"

Dactylic Metres.

Pure Dactylic.

Like pure trochaic metre, pure dactylic metre has a feminine ending to the line, which makes rhyming difficult and does not satisfy the English ear. Very few serious poems keep consistently to a pure dactylic verse, and Robert Graves' "In the Wilderness" is most unusual in this respect, *e.g.*,

"Chríst of His géntleness
Thírsting and húngering
Wálked in the wilderness."

Modified Dactylic Metre.

Normally dactylic metre is modified in that a catalectic line is frequently used, where the final foot is shortened to a trochee or a stressed monosyllable, as in Hood's "Bridge of Sighs" [OBEV 662], the most remarkable dactylic poem in the language, *e.g.*,

"Óne more unfórtunate
Wéary of bréath
Ráshly impórtunate
Góne to her déath."

Shakespeare also uses the catalectic line in the refrain to "Where the bee sucks" [OBEV 140]—

"Mérrily mérrily sháll I live nów
Únder the blóssom that hángs on the bóugh."

It is interesting to note how the catalectic dactylic line of the refrain is matched by the catalectic trochaic line of the verse.

Amphibrach Metres.

Pure Amphibrach Metre.

The amphibrach metre is extremely rare in English, although it occurs occasionally in a few lines, or a refrain, like that to "Blow, blow thou Winter Wind" [OBEV 146]. Laurence Binyon's

"Bablock Hythe" is one of the few poems to use amphibrachs continuously, *e.g.*,

> "Till súnset was rimming
> The Wést with pale flúshes;
> Behínd the black rúshes
> The lást light was dímming."

Modified Amphibrach Metre.

The pure amphibrach line can be used alternating with a catalectic line, shorn of its last syllable, as in Goldsmith's drinking song in "She Stoops to Conquer," Act I, Scene 2, *e.g.*,

> "Let schóol-masters púzzle their bráin
> With grámmar and nónsense and léarning."

Choriambic Metre.

There are few poems in pure choriambic metre. Ruskin's quatrain "Trust Thou thy Love" [OBEV 753] is one of the few examples, *e.g.*,

> "Trúst thou thy Lóve; if she be próud, is she not swéet?"

Choriambic effects are often obtained incidentally, especially in blank verse, when the first foot of a line is a trochee.

Lionel Johnson frequently achieves the same kind of effect in lyric verses by substituting a choriamb for two iambs, as in the poem "By the Statue of King Charles" [OBEV 909], *e.g.*,

> "Cómely and cálm, he rides
> Hárd by his ówn Whitehall."

Sprung Rhythm.

Sprung rhythm was practised by Gerard Manley Hopkins and his followers.

Its distinction lies in the fact that in a foot of verse the first syllable is always stressed, and this stressed syllable may be followed by any number of unstressed syllables from none to three, or even more, as the occasion demands. Hopkins has described sprung rhythm in the Preface to his "Poems."

Quantitative Classical Metres.

Since the Renaissance poets such as Spenser, Coleridge, and Tennyson have from time to time endeavoured to reproduce in English verse the complicated quantitative metres of Greek and Latin verse. The difficulty, if not impossibility, of putting the stress on the long vowel in English has for the most past rendered such experiments interesting only to the scholar.

It should always be remembered that the technical names, such as iamb and trochee, although borrowed from the classics, have in English verse a quite different meaning, referring never to quantity but always to stress.

Metrical Forms of French Origin.

It became fashionable during the last years of the nineteenth century for poets to imitate certain verse forms which had long been practised in France, some of them from the time of the troubadours.

Chaucer and Gower had in the fourteenth century used some of these forms, later English poets had occasionally experimented with some of them, and Swinburne, Austin Dobson, Edmund Gosse, and others did much to adapt and naturalise them, although their intricate rhyming patterns are very difficult to construct in a language so short of rhymes as English. The most popular were the triolet, villanelle, rondeau, ballade, and sestina.

Characteristic of the Anglicised versions are:

1. Freedom as regards metre and length of line.

2. Complicated and exacting rhyme schemes, which permit of no such poetic licence as identical rhyme.

3. A refrain line which recurs in certain stereotyped positions without any alteration of sound, although there may be significant alteration of meaning. Only the sestina is without a refrain.

Triolet.

A triolet is a single stanza of eight short lines. The first line is repeated as the fourth, and the first and second appear again as seventh and eighth. Only two rhymes are used, the scheme being: ABAAABAB.

The triolet was re-introduced into England by Bridges in 1873. Austin Dobson's "A Kiss" is a good example of the form.

> "Rose kissed me today.
> Will she kiss me tomorrow?
> Let it be as it may,
> Rose kissed me today,
> But the pleasure gives way
> To a savour of sorrow;—
> Rose kissed me today,—
> Will she kiss me tomorrow?"

See also Dobson's triolet "I intended an Ode" [OBEV 828].

Villanelle.

The villanelle has five stanzas, each of three lines, followed by one stanza of four lines. It has a refrain which consists of the first and third lines of the first stanza. These lines alternately form the last lines of the four middle stanzas, and reappear as a concluding couplet to the poem. Only two rhymes are employed throughout. Stanzas one to five rhyme ABA and stanza six ABAA.

Austin Dobson wrote several villanelles including the well-known "On a Nankin Plate." The following of Henley's is both a good example and description of the form.

Villanelle by W. E. Henley:

> A dainty thing's the Villanelle
> Shy, musical, a jewel in rhyme,
> It serves its purpose passing well.
>
> A double-clappered silver bell
> That must be made to clink in chime,
> A dainty thing's the Villanelle;
>
> And if you wish to flute a spell,
> Or ask a meeting 'neath the lime,
> It serves its purpose passing well.
>
> You must not ask of it the swell
> Of organs grandiose and sublime—
> A dainty thing's the Villanelle;
>
> And, filled with sweetness, as a shell
> Is filled with sound, and launched in time,
> It serves its purpose passing well.
>
> Still fair to see and good to smell
> As in the quaintness of its prime,
> A dainty thing's the Villanelle,
> It serves its purpose passing well.

Rondeau.

A rondeau is a short and compact verse form. It has thirteen lines, usually of eight syllables, which use only two rhymes, and in addition a refrain, usually of four syllables, which introduces a third rhyme. This refrain consists of the first half of the opening line and is twice repeated, thus giving the rondeau fifteen lines all told. The rondeau is divided into three stanzas with the following rhyme scheme: AABBA: AAB + refrain, C: AABBA + refrain C.

Austin Dobson wrote many rondeaus to this exacting plan, including the ingenious "You bid me try" and "In After Days" [OBEV 830].

A Rondeau by Austin Dobson:

You bid me try.

You bid me try, Blue-Eyes, to write
A Rondeau. What!—forthwith?—to-night?
Reflect. Some skill I have, 'tis true;—
But thirteen lines!—and rhymed on two!
"Refrain," as well. Ah, hapless plight!

Still, there are five lines,—ranged aright.
These Gallic bonds, I feared, would fright
My easy Muse. They did, till you—
You bid me try!

That makes them eight. The port's in sight:—
'Tis all because your eyes are bright!
Now just a pair to end in 'oo'—
When maids command, what can't we do.
Behold!—the RONDEAU, tasteful, light,
You bid me try!

1876

Roundel.

The roundel is a variation of the rondeau. Swinburne in his "Century of Roundels" wrote a hundred, and his pattern is usually followed. It consists of nine full lines, plus the refrain (consisting of the opening half of the first line), which is twice repeated, giving eleven lines all told. Only two rhymes are used throughout. The roundel is divided into three stanzas with the following rhyme scheme: ABA + refrain B; BAB; ABA + refrain B.

Swinburne's roundel called "The Roundel" is especially interesting.

Rondel.

The rondel is a form of verse similar to the rondeau. The modern English version consists of fourteen lines all told. Only two rhymes are used, and the initial two lines are repeated as lines 7 and 8 and again as lines 13 and 14. The rondel is frequently arranged in three stanzas with a rhyme scheme as follows: ABBA; ABAB; ABBAAB.

The rondel was revived in the nineteenth century by Bridges, Dobson, Gosse and Henley, and Dobson's "Love comes back to his vacant dwelling" is one of the best known.

Ballade.

There are several kinds of ballade, but the most popular modern form consists of three eight-lined stanzas followed by an envoy of four lines. Each of the stanzas and the envoy end with a refrain. The rhymes of the eight-lined stanzas are ABABBCBC, and of the envoy BCBC.

Austin Dobson wrote several ballades of this kind, the best known being, "This was the Pompadour's fan," and "And where are the galleons of Spain?"

Chaucer's "Balade," "Hyd, Absolon, thy gilte tresses clere," is of an earlier seven-lined type without an envoy.

A ballade by Austin Dobson:

The Ballad of the Thrush.

Across the noisy street
I hear him careless throw
One warning utterance sweet;
This faint at first, and low
The full notes closer grow;
Hark! What a torrent gush!
They pour, they overflow—
Sing on, sing on, O Thrush!

What trick, what dream's deceit
Has fooled his fancy so
To scorn of dust and heat?
I, prisoned here below,
Feel the fresh breezes blow;
And see, thro' flag and rush,
Cool water sliding slow—
Sing on, sing on, O Thrush!

Sing on. What though thou beat
On that dull bar, thy foe!
Somewhere the green boughs meet
Beyond the roofs a-row;
Somewhere the blue skies show,
Somewhere no black walls crush
Poor hearts with hopeless woe—
Sing on, sing on, O Thrush!

Envoy.

Bird, though they come, we know,
The empty cage, the hush;
Still, ere the brief day go,
Sing on, sing on, O Thrush!

1883

The Chant Royal.

The chant royal is a longer form of ballade. It has five stanzas of eleven lines and an envoy of five lines.

The rhyme scheme is ABABCCDDEDE, and the envoy has rhyme DDEDE.

The Sestina.

The sestina has six stanzas, each of six lines. The end words to the lines of the first stanza are repeated as end words in the other five stanzas, but in a different and stereotyped order. The poem concludes with an envoy.

The first sestina published in English was by Gosse in 1877. Swinburne wrote many, including "I saw my soul at rest upon a day."

The Clerihew.

The clerihew is an amusing quatrain, so called after its inventor Edmund Clerihew Bentley. It disdains regular metre and depends on the simple rhyme scheme AABB. The distinctive characteristic of the clerihew is that it is concerned with some eminent person, who is named in the first line and then described in a wilfully fanciful way, the matter being dictated by the exigencies of the rhyme, as in Bentley's clerihew on J.S. Mill.

"John Stuart Mill,
By a mighty effort of will,
Overcame his natural bonhomie
And wrote 'Principles of Political Economy.'"

We might invent a clerihew for Pears Cyclopædia, and say

"You will find *Pears Cyclopœdia*
A simpler and speedier
Aid in your search for verity
If you do not use it with levity."

Free Verse or Vers Libre.

It is hardly possible to define anything so vague as Free Verse. It is characterised by a greater intensity of feeling and a more elevated language than is usual in prose, and has a rhythm that is different from that of poetry in that it is irregular; it has rhythm but not metre.

Free Verse is arranged in lines, but these lines have an indefinite number of syllables. They have balance but no regularly recurring pattern of stress, and no rhyme.

The best-known writer of Free Verse is Walt Whitman, whose "Leaves of Grass" was published in 1855.

VI. CONCLUSION.

The foregoing account is no more than a description of our traditional verse forms. It in no way implies that verse is written according to rules.

We have only to look at Shakespeare's lyrics [OBEV 133–174] to realise how brilliantly free and inventive the poet can be in devising new and delightful patterns of verse—many of them so subtle as to be very difficult to define All that the students and critics can do is to follow in the poets' wake, endeavouring to understand and elucidate the forms that the maker has created.

Figures of Speech

We constantly use figurative language without realising it. When we say that we are "browned off," "fed up," "at the end of our tether," we do not expect to be taken literally. We are in fact employing metaphors.

An understanding of metaphors and other figurative expressions enables us to use our language with greater confidence and effectiveness. It also helps us to understand more fully what others have written. Especially is it valuable when we read a good novel, play, or poem, for to the creative writer figurative language is as natural as the air he breathes.

The following guide to our figures of speech is arranged alphabetically for ease of reference.

Alliteration. A kind of repetition. Two or more words in close succession begin with the same letter, or sound, usually a consonant. Up to the fourteenth century much English verse was written according to an alliterative principle, as in this modernised quotation from "Piers Plowman."

"I had *w*andered me *w*eary so *w*eary I rested me
On a *b*road *b*ank by a merry-sounding *b*urn."

A strong tendency to alliteration still survives in our poetry. Shakespeare ridicules it in the mechanical's play in "A Midsummer Night's Dream" (Act V, Scene 1) in such lines as—

"Whereat, with blade, with bloody blameful blade,
He bravely broach'd his boiling bloody breast."

Anti-climax. See Bathos.

Antithesis. A figure of speech where ideas are so set out that they are in sharp contrast to each other, *e.g.*,

"Better to reign in Hell than serve in Heav'n."
Milton.

"To err is human, to forgive divine."
Pope.

Apostrophe. A figure of speech where the speaker or writer suddenly breaks off and directly addresses some other person who may be present either in the flesh or only in the imagination. Often it is not a person but a thing, abstraction, or personification that is addressed, as in Milton's famous apostrophe, "Hail, holy light" in "Paradise Lost," Book III, line 1. Apostrophe can be used with comic effect, *e.g.*,

"She turns, O guardian angels stop her
From doing anything improper."

(This couplet is also, incidentally, an example of bathos.)

Assonance. (1) Assonance is correspondence of vowel sounds. For instance, in the opening lines of the "fairy song" in "A Midsummer Night's Dream" (Act II, Scene 3) there is a play on only three vowels, and this repetition helps towards the effect of a magic charm, *e.g.*,

"Philomel, with melody, Sing."

In Tennyson's poem "Break, break, break" the repetition of the "o" sound in the second line is like an outcry of grief, *e.g.*,

"On thy cold grey stones, *O* sea."

(2) Assonance is sometimes used instead of rhyme, especially in early folk poetry. Here there is correspondence of one word with another in the accented vowel and any vowels which follow, but not in the consonants, *e.g.*, in "King Estmere," "Spain" is rhymed with "same," and "barone" with "home."

Bathos or Anti-climax. A figure of speech that consists of a sudden and ludicrous descent from lofty to trivial things. In "The Rape of the Lock" Pope wittily used bathos to satirise the frivolity of the woman of fashion, who lacking all sense of proper feeling, casts the same "screams of horror," and "shrieks to pitying heav'n,"

"When *husbands* or when *lapdogs* breathe their last."

The careless writer may fall to bathos which is unintentionally comic in its effect. The word "bathos" in Greek means "depth."

Climax. A figure of speech where ideas are set out in such a way that each rises above its predecessor in fable. In Greek the word "climax" means a ladder. One of the finest examples is in Shakespeare's "The Tempest" (Act IV, Scene 1) when Prospero says,

"And like the baseless fabric of this vision
The cloud-capp'd towers, the gorgeous palaces,
The solemn temples, the great globe itself,
Yea, all which it inherit, shall dissolve."

Epigram. A concise and pointed saying, effective by its wit and ingenuity. It often uses antithesis. S. T. Coleridge's definition of this form is in itself an epigram, *e.g.*,

"What is an epigram? a dwarfish whole:
Its body brevity, and wit its soul."

Euphemism. A figure of speech where a harsh or distressing expression is replaced by one that is gentler, if less accurate. Thus we may call a lie a "flight of fancy," or a "terminological inexactitude." There is a striking instance of euphemism in "Macbeth" (Act I, Scene 5), when Lady Macbeth, planning the murder of her guest, Duncan, says, "He that's coming must be provided for."

Hypallage or "Transferred Epithet." A figure of speech where an adjective, or adverb, is separated from the word to which it belongs grammatically, and is transferred to some other word in the sentence, its unusual position giving it a kind of emphasis. The word "obsequious" is thus transferred in the sentence "A lacquey presented an obsequious cup of coffee."

Hyperbole. A figure of speech where there is a deliberate use of exaggeration for the sake of effect as in the phrase "tons of money." Lady Macbeth uses hyperbole when she says, "Here's the smell of blood still; all the perfumes of Arabia will not sweeten this little hand" (Act V, Scene 1).

Writers of film trailers frequently indulge in hyperbole.

Innuendo. A figure of speech where something is hinted at, or suggested, but not openly stated. Dickens uses innuendo to suggest Scrooge's stinginess by saying, "Darkness was cheap, and Scrooge liked it."

Irony. (1) A figure of speech where the speaker says one thing but intends the opposite to be understood. Shylock uses the word "courtesies" ironically when he says,

"Fair sir, you spit on me on Wednesday last,
You spurn'd me such a day; another time
You call'd me dog; and for these courtesies
I'll lend you thus much moneys."
"Merchant of Venice" (Act I, Scene 3).

The use of irony can clearly be seen in Shakespeare's "Julius Cæsar" in Antony's well-known speech to the citizens. They gradually realise

that when Antony repeats that Brutus and the rest are "honourable men," he is speaking ironically, and intends the opposite. When they fully perceive this they cry, "They were traitors . . . villains, murderers." ("Julius Cæsar," Act III, Scene 2.)

(2) *Dramatic irony* is the use of words which have a second inner significance that is not realised by some of the actors in a scene. For instance, in Sheridan's "School for Scandal," Act IV, Scene 3, Sir Peter admires Joseph Surface's useful screen, and Surface replies, "Oh yes, I find great use in that screen." He and the audience know, but Sir Peter does not, that at that very moment the screen is concealing Peter's own wife who had rashly visited Joseph.

It is helpful to remember that in Greek the word "irony" means "dissimulation."

Litotes. A figure of speech which is really a special kind of understatement (or Meiosis). Instead of making a positive statement (*e.g.*, "This is a difficult task") we might use Litotes, and say "This is no easy task," thus expressing a positive by the negative of its opposite.

Malapropism. An amusing inaccuracy in vocabulary. Words that have an accidental similarity in sound may become confused in the speaker's mind and the wrong word may come uppermost. Thus Mrs. Malaprop complains that the disobedience of her niece gives her, not "hysterics," but "hydrostatics." It is not surprising that Mrs. Malaprop, of Sheridan's "The Rivals," has given her name to this kind of verbal confusion, though many before her time, including humble folk in Shakespeare's plays, have uttered malapropism. Bottom, in "A Midsummer Night's Dream," says that in the wood they "may rehearse more obscenely" when he means "obscurely."

Meiosis. A figure of speech where a deliberate understatement is made for the sake of effect. English people are especially fond of Meiosis and often use it colloquially, in such an expression as "He made a very 'decent' contribution," meaning a very "generous" contribution. The full meaning of what we intend is often conveyed by the tone of voice, *e.g.*,

"This is *some* war."

Metaphor. It is helpful to think of the figure of speech, metaphor, as a condensed simile. In metaphor one thing is not merely *compared* to another, as in simile, but is boldly spoken of as if it actually *were* that other. Thus Bacon, in the following metaphor, does not say books are *like* food, but speaks of them as if they actually *were* food, *e.g.*, "Some books are to be tasted, others to be swallowed, and some few to be chewed and digested."

Metaphor is usually defined as the transfer of a name, or descriptive term, to some object to which it is not properly applicable, thus making an implicit comparison. Shakespeare uses nautical terms to describe our human situation when Brutus says,

"There is a tide in the affairs of men which, taken at the flood, leads on to fortune" ("Julius Cæsar," Act IV, Scene 2).

In *Mixed Metaphor* two or more inconsistent metaphors are used of the same object, as when, speaking of a suspicion, someone said, "I smell a rat; I see it in the air; but I will nip it in the bud."

Metonymy. A figure of speech where a person or thing is not named directly, but by some associated thing. Instead of saying, "The prisoner addressed the magistrate," we might use metonymy, and say, "The prisoner addressed the bench." Similarly, "a speech from the Lord Chancellor" is sometimes called "a speech from the Woolsack."

Onomatopœia. The use of words which imitate or echo the sounds they suggest, *e.g.*,

"Seas half-frozen slushed the deck with slime."
Masefield.

Oxymoron. A figure of speech where words that are usually contradictory are combined in one expression, *e.g.*, "bitter-sweet."

"I know this is a joyful trouble to you."
"Macbeth," Act II, Scene 1

Paradox. A figure of speech where a statement is made that at first sight seems contradictory, or absurd, *e.g.*,

"The rule of the road is a paradox quite:
If you keep to the left, you are sure to be right."

and

"The child is father of the man."
Wordsworth.

Pathetic Fallacy. A figure of speech where it is assumed that things of nature have feelings like those of human beings, *e.g.*,

"And daffadillies fill their cups with tears."
Milton.

In Greek "pathos" means "feeling."

Personification. A figure of speech where some abstraction, or some inanimate thing is represented as a person, *e.g.*,

"Rule, Britannia."

"But look the dawn in russet mantle clad
Walks o'er the dew of yon high eastern hill."
Hamlet, Act I, Scene 1.

Personification is really a special kind of metaphor.

Pun. The use of words so as to convey a double meaning, as in Belloc's couplet

"When I am dead, I hope it may be said
'His sins were scarlet, but his books were read.'"

In the three puns that follow there is a suggestion of a banking transaction! "The Egyptians received a check on the bank of the Red Sea which was crossed by Moses." Puns, which were popular in the nineteenth century, especially with Lamb and Hood, are now out of favour.

Simile. A figure of speech which makes a comparison pointing out a similarity between things otherwise unlike. It is usually introduced by "like" or "as," *e.g.*,

"Men fear death as children fear to go in the dark."
Bacon.

"His own thought drove him like a goad."
Tennyson.

Spoonerism. An accidental transposition of the sound of two words, so called after Rev. W. A. Spooner, warden of New College, Oxford, *e.g.*,

"You have hissed all my mystery lectures" for "You have missed all my history lectures."

Synecdoche. A figure of speech where the name of a part is used for the whole, or the whole for the part, *e.g.*,

"A fleet of a hundred sail",

meaning of a hundred ships.

Synecdoche is really a special kind of Metonymy.

Transferred Epithet. See Hypallage.

Literary Forms

Allegory. A description or story which has a second and deeper significance below the surface. The characters are really personifications, usually representing some vice or virtue. Allegory flourished in the Middle Ages, but the best-known allegory in the world is Bunyan's "Pilgrim's Progress" (1678), which has been translated into over a hundred different languages and dialects. (*See* **G49** (1)). On the surface "The Pilgrim's Progress" is the story of a journey in which the hero encounters many difficulties but at last reaches his destination. Its inner meaning is the progress of the Christian soul through life on earth. Spenser's "Faerie Queene" (1589 and 1596) is a more subtle and complex allegory, capable of several interpretations, religious, ethical, and political. Allegory has been described as extended metaphor. *See* **M10–11.**

Autobiography. The story of a man's (or woman's) own life, written by himself. The autobiography is becoming increasingly popular, recent excellent examples being Stephen Spender's *World within World*, Richard Church's *Over the Bridge* and Laurie Lee's *Cider with Rosie*.

Ballad. There are two chief types of ballad:

1. A light song, often sentimental, as was the Victorian ballad, or a popular song, often of a personal kind, praising or attacking some notability.

2. A traditional poem, passed on by word of mouth. Many of our traditional ballads date from the 15th century. They tell some stirring tale, as do the many ballads about Robin Hood. Sometimes they record an actual occurrence, like the ballad "The Battle of Otterbourne," which tells of a Border skirmish, fought in 1388. Such ballads are enlivened by lively dialogue, and they use a special kind of stanza, which is described on **M5.**

Ballade. A short highly stylised poem, with a strict verse form. *See* **M9.**

Biography. A narrative telling the life story of some actual person, usually a well known figure. The most famous biographer of classical times was Plutarch, who in the 1st century B.C. wrote his series of parallel "Lives" of twenty-three Greeks and twenty-three Romans. *See* **G78** (1). The English translation of this provided Shakespeare with some of the plots of his plays. Boswell's *Life of Samuel Johnson* (1791) is our best-known English biography.

Burlesque. The aim of burlesque is to make us laugh by ridiculing the work of some other writer. Sometimes it treats his serious subject in a mocking way. Sometimes it takes the form of an absurd imitation or caricature of his style. Some of our most successful burlesques are dramatic in form, like Sheridan's "The Critic," produced in 1779. This has a play within a play, called "A Tragedy Rehears'd," a brilliant burlesque of the sentimental, historical plays so popular in his time. Danny Kaye's film, "The King's Jester," is a burlesque of pseudo-historical films.

Chant Royal. A poem of a strictly formal kind, French in origin. *See* **M9.**

Clerihew. A single-stanza verse form, four lines long. *See* **M9.**

Comedy. A play which is happy and amusing in tone, but not necessarily light or superficial. A comedy always has a fortunate conclusion. Shakespeare's "Twelfth Night" and Oscar Wilde's "The Importance of being Earnest" are typical examples.

Drama. A play in verse or prose, where the story is unfolded and the characters represented through the actions and speeches of actors on a stage. It is essential to good drama that there should be some kind of dynamic action and some conflict between the characters. In comedy the conflict is usually open and external. "As You Like It," for instance, begins with a quarrel between Orlando and Oliver. But most of the world's finest tragedies reveal also an inner conflict in the soul of man. In "Hamlet" the hero is at odds with many people, including his mother, the king, Ophelia, Polonius, and Laertes, but all these struggles are of secondary significance, compared with the conflict in his own mind. Even a play like "Waiting for Godot," which reduces incident and conflict to a minimum, must make some concession to the demand of the audience for the dynamic. Drama cannot be static. Occasionally poets have written dramas which they knew were not practicable for the stage. Shelley's lyrical dramas, "Prometheus Unbound" and "Hellas," are of this kind.

Eclogue. In classical literature a brief poem, usually in the form of a dialogue between shepherds. It was a popular form in the time of the Renaissance; Spenser's "Shepheardes Calendar" (1579) consists of twelve eclogues, one for each month of the year.

Elegy. A lyric poem of lamentation for the dead. Gray's "Elegy in a Country Church-yard" (1750) is the best-known English elegy. It reflects in a general way on the "destiny obscure" of the humble folk who are buried in a quiet church-yard, probably that of Stoke Poges, but most elegies mourn the death of only one person. Such are Shelley's "Adonais" (1821), on the death of Keats, and Matthew Arnold's "Thyrsis" (1867), commemorating his friend Arthur Hugh Clough. Tennyson's "In Memoriam" (1850) is unusual, in that it is not a single elegy, but a series of elegiac poems, inspired by the poet's grief for the death in 1833 of his friend Arthur Hallam.

Epic. A very long narrative poem, usually consisting of several books. The epic tells of the splendid deeds of some hero of history or legend, and is frequently concerned with war. Some of the world's greatest epics are the Greek "Iliad" and "Odyssey," ascribed to Homer, the Latin "Aeneid" of Virgil, the Hindu "Mahabharata," and Milton's "Paradise Lost," whose hero is God himself. The epic is distinguished by its sustained dignity of style.

Epilogue. *See* **Prologue.**

Essay. The word essay, derived from the French, means literally an "attempt" or "endeavour," and as a literary term it applies to a short prose composition which attempts to present the author's reflections on any subject he chooses. As a literary form the essay derives from the French "Essais" of Montaigne, first translated into English by Florio in 1603. (*See* **G48** (1).) Our first English essayist was Francis Bacon, who published between 1597 and 1625 three volumes of his essays, brief, pithy, and objective in character. In course of time the essay has be-

come more subjective and personal, especially in the hands of Lamb, Hazlitt, and contemporary writers.

Extravaganza. A composition, musical or literary, which uses improbable and fantastic elements and incidents. A good example of narrative extravaganza is Thackeray's *Rose and the Ring* (1855), in which, for instance, Gruffanuff's husband, the footman, is, because of his rudeness, turned into a door-knocker. Extravaganzas are frequently dramatic in form, and most pantomimes may be regarded as such.

Fable. A very brief story designed to teach some lesson or moral. The characters of the story are often animals, birds, or insects, which converse like human beings. The most famous of all fables are those attributed to Aesop, and those of La Fontaine, the French writer of the 17th century.

Farce. A species of dramatic comedy whose whole aim is to excite laughter. It does not scruple to use improbable characters and incidents and absurd situations. "Charley's Aunt" is a typical farce.

Lampoon. A coarse satire (q.v.) attacking an individual. Lampoons are usually short. The word itself is derived from a French word meaning "drinking song."

Limerick. A single-stanza verse form, 5 lines long and with a formal metre and rhyme scheme. *See* **M7**.

Lyric. In ancient Greece a lyric was originally a poem meant to be sung to the accompaniment of the lyre, a stringed musical instrument rather like a small harp. Later the word was used for a poem with song-like qualities: short, usually divided into verses, and expressing the feelings of the poet. The lyric flourished in England in the Elizabethan age, as witnessed by the lovely lyrics scattered through Shakespeare's plays. Neglected in the 18th century, it became popular again with the Romantic poets of the 19th century. Odes, elegies, and sonnets are all species of lyrics.

Mask or **Masque.** A dramatic entertainment performed by amateurs and originating in the court masquerade. The action or plot of the masque is of the slightest and there is little concern with portrayal of character, for the masque gives pleasure by means of its verse, music, and dancing, and its elegant costume and scenery. It was very popular in the 16th and 17th centuries, and from 1605 Ben Jonson wrote many court masques, for which Inigo Jones designed original costumes and settings. Our best-known examples are Shakespeare's masque in Act IV of "The Tempest" and Milton's "Comus."

Melodrama. There are two meanings of the word melodrama.

1. In the early 19th century a melodrama meant a play, usually of a romantic and sensational kind, in which songs were inserted, and where an orchestra accompanied the action. The musical comedy of today might be regarded as its modern counterpart.

2. Today the word melodrama is used of an inferior kind of play, which deliberately excites the emotions by its sensational and violent happenings, but which has a happy ending. We should be careful to distinguish melodrama, which uses violence for its own sake, from serious plays, like "Hamlet" or "King Lear," where violent acts are only incidents necessary to a profound interpretation of human conduct.

Memoirs. The word is normally used of a record of events of which the author has some personal experience or special source of information.

Miracle Plays. Mediæval verse plays produced from the late 14th to 16th centuries by the town guilds and performed in the market-place, or other suitable open space. They consisted of a series of dramatised stories from the Bible or Lives of Saints. Each scene would be allotted to one of the guilds, which was then responsible for its production on a wheeled stage. As soon as the actors of one guild had completed their scene, their stage would be trundled off, sometimes to another rendezvous, and would itself be succeeded by another stage with its scene, until a whole cycle of episodes had been performed. Four great cycles of miracle plays are still extant called after the towns where they were probably performed, York, Coventry, Chester, and Wakefield. The Wakefield cycle is often called the Towneley cycle. The plays have not only a strong religious sense but also a lively comic spirit. The Towneley cycle has some especially racy comic scenes. One popular incident shows the noisy quarrel that results when Noah's wife refuses to go into the ark. *See* **G39** (**2**).

Mock Heroic. A species of parody (*q.v.*), caricaturing some play or poem written in a lofty and high-flown style. "The Rehearsal" (1672), by Villiers, is typical. It is an absurd imitation ridiculing the artificial and high falutin' heroic plays which were then in vogue.

Monody. In Greek literature an ode sung by a single voice, like our solo in music. In English literature it signifies a poem of mourning for someone's death. The elegies "Lycidas," by Milton, and "Thyrsis," by Matthew Arnold, were both called monodies by their authors.

Monologue. Originally a scene where one person of the drama spoke alone. Today it usually means a dramatic composition for a single actor, such as the well-known Lancashire monologues presented by Stanley Holloway. The word is also sometimes used as meaning soliloquy.

Moralities or **Morality Plays.** Mediæval verse plays of an allegorical kind, which attempted to teach lessons of virtue, the persons of the drama usually being not real people, but personifications. Most Moralities date from the 15th century, the best known being "Everyman," which is Dutch in origin. The hero, Everyman, is summoned by Death, and vainly appeals for help to his friends, Fellowship, Kindred, Goods, Knowledge, Beauty, and Strength, but all fail him. Only his own Good Deeds will consent to accompany him on his last journey. *See* **G39** (**2**).

Mysteries or **Mystery Plays.** Some modern writers use the term "Mystery play" instead of "Miracle play" (*q.v.*). It is really an alternative title. One critic tried to distinguish between "Mystery plays," as concerned with stories from the Gospels, and "Miracle plays," as concerned with the lives and deeds of Saints, but this distinction is not usually followed.

Novel. A lengthy prose fiction in narrative form, telling a realistic story of people and their doings. Its chief interest is in character and incident. The first English novelist was Samuel Richardson, whose novels, especially *Pamela* (1740–41) and *Clarissa Harlowe* (1747–48), had a European reputation. In the present century writers like James Joyce, and Virginia Woolf have written what have been called novels of the "stream of consciousness," where the interest lies not so much in the incidents as in the mind's response to events, and reflections.

Ode. In classical literature an ode was a poem to be sung. In English literature it signifies a

lyric poem, usually in rhyme, and is seldom longer than 150 lines. It is usually in the form of an address, and lofty in its feeling and style. The ode was popular with the romantic poets. Some of our best known are Shelley's "Ode to the West Wind," and Keats' "Ode to a Nightingale," "Ode on a Grecian Urn," and "To Autumn," all of them published in 1820.

Parable. A brief story serving as an example of some general principle, usually ethical, which gives the story its significance. Such is Christ's parable of the Good Samaritan. Most parables are miniature allegories. The parables of the Sower and the Good Shepherd are both allegorical in form.

Parody. A literary caricature, which mimics the themes and style of some other author in such a way as to make his faults seem absurd and laughable. J. C. Squire's *Tricks of the Trade* is an amusing collection of his skilful parodies of such writers as Byron, Wordsworth, and Masefield.

Pastoral. A pastoral poem, romance, or play is one in which the life of shepherds or of simple rustic folk is portrayed in an idealised way. Originating in Greek literature, the pastoral was revived at the time of the Renaissance. Spenser's "Shepheardes Calendar" consists of twelve pastoral eclogues. Shakespeare's "As You Like It" is a pastoral play, Milton's "Lycidas" is a pastoral elegy and his "Comus" a pastoral masque. There is usually in the pastoral a deeper meaning below the surface. A critic has said, "The shepherd's cloak was the acknowledged disguise of the lover, the poet, the courtier, the pastor of souls, the critic of contemporary life." In the pastoral form the charm of a simple setting and deeper significance are combined.

Prologue and Epilogue. Generally speaking, a prologue means a foreword, or preface, and an epilogue an appendix to a literary work, but the terms are often used more specifically when referring to a play. Here the prologue is a short speech in verse or prose spoken to the audience by one of the actors before the play begins, the epilogue a similar speech after its conclusion. The prologue endeavours to put the audience into a receptive state of mind, the epilogue to ask for a kind reception to the play. Shakespeare's "Romeo and Juliet" has a prologue, his "As You Like It" an epilogue, spoken by Rosalind, who says, "Good plays prove the better by the help of a good epilogue." In the 18th century it was customary for a leading actor to speak the prologue and for a leading actress to make a plea for the play in the epilogue.

Romance. The romance of the early Middle Ages was a fictitious tale in verse, telling the adventures of some hero of chivalry, the interest being in the incidents, sometimes of a supernatural kind, rather than in character. The most famous of these early romances is the French "Chanson de Roland" of the early 12th century. (*See* **G38** (2).) In the later Middle Ages a romance might be written in prose. In the 16th and 17th centuries a romance meant a tale in either prose or verse in which the scenes and incidents were remote from those of real life. Sir Philip Sidney's "Arcadia" (1590), written to entertain his sister, is of this type. Today the word romance is rather vaguely used of a tale of somewhat improbable events. Sir Henry Rider Haggard wrote several such romances, including *King Solomon's Mines* (1886), and *She* (1887).

Rondeau. A poem of a strictly formal kind, French in origin. *See* **M8**.

Rondel. A poem similar in form to the rondeau. *See* **M9**.

Roundel. A variation of the Rondeau. *See* **M9**.

Saga. The word saga, which is of Norse origin, and means story, is applied to the mediæval prose narratives of Iceland and Norway, especially those concerned with the traditions of Icelandic families and Norwegian kings. William Morris, in his "Earthly Paradise," gives in "The Lovers of Gudrun" a version of the Icelandic Laxdæla Saga. *See also* **G38** (2).

Satire. A work in either verse or prose attacking folly and vice. Pope's "Dunciad," in verse, published between 1728 and 1743, ridicules contemporary authors and literary follies in a massive attack on dulness and literary hacks. Swift's *Gulliver's Travels* (1726), which on the surface is a series of prose tales of travel to imaginary countries, is actually a comprehensive satire. It begins, in the first book on "Lilliput," with incisive ridicule of the squabbles between English political parties and religious sects, and culminates, in the final book on the Houyhnhnms, in a devastating attack on all that is bestial in human nature. Samuel Butler's *Erehwon* (an anagram of Nowhere), published in 1872, also uses a prose travel tale in his satirical exposure of Victorian convention and hypocrisy. Although not precisely satires, many of Shaw's plays are satirical in spirit. "Arms and the Man" may be considered in one of its aspects as a satire on war.

Sestina. A poem of a strictly formal kind, French in origin. *See* **M9**.

Skit. A light satire, often in the form of parody.

Soliloquy. In a soliloquy a man talks to himself, or utters his thoughts aloud regardless of the presence of others who may hear him. The word is usually applied to such utterances by a character in a play. The most famous soliloquies in literature are those of Hamlet.

Sonnet. A lyric poem of fourteen lines, with an intricate rhyme scheme. *See* **M6**.

Squib. A brief, sharp satire (*q.v.*) attacking an individual.

Threnody. A term from the Greek, seldom used today. It means a song of mourning, especially a lament for the dead.

Tragedy. A play, or other literary work, which is preoccupied with the serious and unhappy aspects of life. It is sombre in tone and ends with misfortune. Shakespeare's "Macbeth" and Ibsen's "Ghosts" are typical tragedies.

Tragi-Comedy. The word is used in two different ways:

(*a*) It may denote a play (or very occasionally a story) which combines both tragic and comic elements. Chekhov's "The Cherry Orchard" is a tragi-comedy of this type.

(*b*) It may also mean a play which is for the most part sombre in theme and tone, but which has a happy conclusion, like Shakespeare's "The Winter's Tale."

Trilogy. In Greek literature a series of three tragedies, like Aeschylus' trilogy, the "Oresteia," written when he was nearly seventy, in the 5th century B.C. (*See* **G21** (1).) In modern times the word trilogy is applied to any sequence of three literary works which are related to each other in subject and theme.

Triolet. A single-stanza verse form, eight lines long, and with a very formal pattern, French in origin. *See* **M8**.

Villanelle. A poem of a strictly formal kind, French in origin. *See* **M8**.

How to Enjoy a Poem

Many people who enjoy listening to music, and seeing paintings, find it difficult to appreciate poetry, and a few suggestions as to how we may approach a poem may be useful. A very good practice is to read the poem aloud. Poetry uses the musical sounds and rhythms of words, and although the printed words on the page may seem flat, like a score of music, the actual sound and rhythm of the spoken words help the lines to come alive. It is best when reading or hearing a poem for the first time to keep an open mind, ready to receive whatever impression it may make and trying to suspend judgment. Someone was once looking at a piece of modern statuary that he could not understand and was foolishly condemning, when a friend who was an art critic said, "Just walk round it." In the same way we can, as it were, walk round the poem until its significance begins to dawn on us. We must remember first and foremost that a poet normally uses words not literally, but with a figurative meaning. He loves to speak of one thing as if it were another. When Keats describes the pleasure he has had in his wide reading he speaks of books as if they were countries and he himself a traveller.

"Much have I travell'd in the realms of gold,
And many goodly states and kingdoms seen."
OBEV 641.

Making out the Meaning. Remembering always that the poet normally speaks in images, we need to pay close attention to the words he uses if we are to enjoy their full meaning. I. A. Richards describes in his book *Practical Criticism*, 1929, how he gave a group of people, undergraduates and others, unfamiliar poems to read and then asked for their written interpretations. In the light of these, he formulated certain principles which aid one in "making out the meaning," which as he rightly says is the fundamental problem. He distinguished four kinds of "meaning": the plain "sense" of the poem, the "feeling," the "tone," and the "intention," and many readers of poetry now find it enlightening to consider a poem from these four aspects. The plain "sense" is arrived at simply by deciphering the words, and incidentally the punctuation, in an attempt to find out what the poet actually says. Readers do not always take the trouble to do this. Another aspect of meaning is the poet's "feeling" for his subject. Does he, for instance, express awe, tenderness, anger, amusement? Then there is his "tone" towards the reader. Is it confidential, or appealing, or didactic? Finally Richards speaks of the "intention" of the poem, the whole aim that the writer is trying to pursue.

Distinguishing Subject and Theme. Another illuminating way of looking at a poem is to distinguish between its subject and its theme, for they are seldom identical. A poet loves to transpose his experience into another setting, and below his surface narrative or description, we usually find a secondary meaning, the theme, which is the core of the poem. Often there are many such themes, subtly woven together. Keats chose for the subject of one of his odes a Grecian urn (OBEV 632), but the themes of the ode are manifold, one being the magic of art which captures for ever the fleeting moment. Similarly, Shelley addressed an ode to the West Wind, and here one of the main themes is a plea for poetic inspiration (OBEV 617).

The Formal Aspects of the Poem. Other pointers to its meaning are the formal pattern of the poem—the literary form in which it is cast, the versification (*see* **M2–9**), the kind of imagery, or figures of speech (*see* **M10–11**). The great poet suits the form to the meaning, as the glove fits a hand, and although the form, like the glove, is something external, it can give a clear indication of what is within.

Study of Shakespeare's Sonnet 73 (OBEV 162).

"That time of year thou may'st in me behold,
When yellow leaves, or none, or few do hang
Upon those boughs which shake against the cold—
Bare ruin'd choirs where late the sweet birds sang.
In me thou see'st the twilight of such day,
As after Sunset fadeth in the West,
Which by and by black night doth take away,
Death's second self that seals up all in rest.
In me thou see'st the glowing of such fire,
That on the ashes of his youth doth lie,
As the death-bed, whereon it must expire,
Consum'd with that which it was nourish'd by.
This thou perceiv'st, which makes thy love more strong,
To love that well, which thou must leave ere long."

Kinds of Meaning. Searching for the plain "sense," we find here three clearly defined images, the first of very late autumn,

"When yellow leaves, or none, or few do hang
Upon those boughs which shake against the cold——"

Then follows an image of twilight, the brief phase after the sunset has faded and before the fall of night. The third image is of a dying fire, glowing amid its ashes. All these, says Shakespeare, "thou may'st in me behold." All three, then, suggest that phase in man's life that follows the prime, the decline towards death. The "feeling" of these first twelve lines is sombre and foreboding, and in its "tone" the poem speaks to one alone—"thou may'st behold," "thou see'st." Then when we reach the concluding couplet we perceive the "intention" of the poem. It is a love poem,

"This thou perceiv'st, which makes thy love more strong,
To love that well, which thou must leave ere long."

The sober reflections on decline and death are set against a statement of steadfast love.

Subject and Theme. We can also approach the poem trying to distinguish "subject and theme." Then we perceive more clearly the theme of the imminence of death, which gradually develops and gathers momentum. For instance, the trees are called "bare ruin'd choirs" where the birds no longer sing, and this suggests a ruined empty abode from which the voice has flown, the spirit departed. Then the "black night" which succeeds twilight is "Death's second self," and the fire lies on the ashes "As the death-bed, whereon it must expire."

The very colours of the poem are suggestive. A picture is painted in sombre greys and black, lit up by a dull glow soon to be engulfed in darkness, the yellow leaves on the bough, the sunset fading into twilight, the fire dying on the ashes. It is like the chiaroscuro of a Rembrandt painting.

Formal Pattern. If we now attend to the formal patterns of the poem we find how exquisitely they match the sense. The poem is a sonnet (*see* **M6**), that is a brief lyric poem of only fourteen lines, expressing feeling in a taut and concentrated way. There is no room for digression; every word counts.

As we expect from a Shakespearean sonnet we find the rhyme scheme ABAB CDCD EFEF GG. This indicates that the poem will naturally take the design of three quatrains and a concluding couplet. Then how exquisitely and precisely each image is contained within the brief compass of its quatrain, and how apt are the metaphors in which the images are expressed.

Even so we have no longer exhausted the significance of this short poem. Much is left to discover, and light is shed by the sonnets that precede and follow it in Shakespeare's sequence.

FAMILIAR FOREIGN PHRASES AND CLASSICAL QUOTATIONS

Fr., French. Gr., Greek. Ger., German. It., Italian. L., Latin. Sp., Spanish.

à bas (Fr.), down, down with.
ab extra (L.), from without.
ab incunabilis (L.), from the cradle.
ab initio (L.), from the beginning.
ab intra (L.), from within.
à bon chat, bon rat (Fr.), to a good cat, a good rat; well attacked and defended; tit for tat; a Rowland for an Oliver.
à bon marché (Fr.), cheap, a good bargain.
à bras ouverts (Fr.), with open arms.
absente reo (L.), the accused being absent.
absit invidia (L.), let there be no ill-will; envy apart.
ab uno disce omnes (L.), from one specimen judge of all the rest; from a single instance infer the whole.
ab urbe conditâ (L.), from the building of the city; i.e., Rome.
a capite ad calcem (L.), from head to heel.
à chaque saint sa chandelle (Fr.), to each saint his candle; honour where honour is due.
à cheval (Fr.), on horseback.
à compte (Fr.), on account; in part payment.
à corps perdu (Fr.), with might and main.
à couvert (Fr.), under cover; protected; sheltered.
ad astra (L.), to the stars.
ad calendas Græcas (L.), at the Greek calends; *i.e.*, never, as the Greeks had no calends in their mode of reckoning.
à demi (Fr.), by halves; half-way.
a Deo et rege (L.), from God and the king.
ad hoc (L.), arranged for this purpose; special.
ad hominem (L.), to the man; to an individual's interests or passions; personal.
adhuc sub judice lis est (L.), the case has not yet been decided.
a die (L.), from that day.
ad infinitum (L.), to infinity
ad interim (L.), in the meantime.
ad libitum (L.), at pleasure.
ad modum (L.), after the manner of.
ad nauseam (L.), to disgust or satiety.
ad referendum (L.), for further consideration.
ad rem (L.), to the purpose; to the point.
ad valorem (L.), according to the value.
affaire d'amour (Fr.), a love affair.
affaire d'honneur (Fr.), an affair of honour; a duel.
affaire de cœur (Fr.), an affair of the heart.
a fortiori (L.), with stronger reason.
à gauche (Fr.), to the left.
à genoux (Fr.), on the knees.
à haute voix (Fr.), aloud.
à huis clos (Fr.), with closed doors; secretly.
à la belle étoile (Fr.), under the stars; in the open air.
à la bonne heure (Fr.), well timed; all right; very well; as you please.
à l'abri (Fr.), under shelter.
à la mode (Fr.), according to the custom or fashion.
à la Tartufe (Fr.), like Tartuffe, the hero of a celebrated comedy by Molière; hypocritically.
al fresco (It.), in the open air; out-of-doors.
al più (It.), at most.
alter ego (L.), another self.
à merveille (Fr.), to a wonder; marvellously.
amor patriæ (L.), love of country.
amour-propre (Fr.), self-love; vanity.
ancien régime (Fr.), the ancient or former order of things.
anguis in herba (L.), a snake in the grass.
anno Christi (L.), in the year of Christ.
anno Domini (L.), in the year of our Lord.
anno mundi (L.), in the year of the world.
annus mirabilis (L.), year of wonders; wonderful year.
ante bellum (L.), before the war.
ante lucem (L.), before light.
ante meridiem (L.), before noon.
à outrance (Fr.), to the utmost; to extremities; without sparing.
à pied (Fr.), on foot.
à point (Fr.), to a point, just in time, exactly right.
a posse ad esse (L.), from possibility to reality.
ariston metron (Gr.), the middle course is the best; the golden mean.
arrière-pensée (Fr.), hidden thought; mental reservation.
au courant (Fr.), fully acquainted with.
audi alteram partem (L.), hear the other side.
au fait (Fr.), well acquainted with; expert.
au fond (Fr.), at bottom.
auf Wiedersehen! (Ger.), till we meet again.
au pis aller (Fr.), at the worst.
au revoir (Fr.), adieu till we meet again.
aut vincere aut mori (L.), either to conquer or to die; death or victory.
a verbis ad verbera (L.), from words to blows.
a vinculo matrimonii (L.), from the bond of matrimony.
à volonté (Fr.), at pleasure.
a vostra salute (It.), *à votre santé* (Fr.), *a vuestra salud* (Sp.), to your health.
bas bleu (Fr.), a blue-stocking; a literary woman.
beau monde (Fr.), the world of fashion.
beaux esprits (Fr.), men of wit; gay spirits.
beaux yeux (Fr.), fine eyes; good looks.
ben trovato (It.), well or cleverly invented.
bête noire (Fr.), a black beast; a bugbear.
bon gré mal gré (Fr.), with good or ill grace; willing or unwilling.
bonhomie (Fr.), good-nature; artlessness.
bonne bouche (Fr.), a delicate or tasty morsel.
bon vivant (Fr.), a good liver; a gourmand.
brutum fulmen (L.), a harmless thunderbolt.
canaille (Fr.), rabble.
candida Pax (L.), white-robed Peace.
casus belli (L.), that which causes or justifies war.
causa sine qua non (L.), an indispensable cause or condition.
caveat emptor (L.), let the buyer beware (or look after his own interest).
cela va sans dire (Fr.), that goes without saying; needless to say.
ceteris paribus (L.), other things being equal.
chacun son goût (Fr.), every one to his taste.
cogito, ergo sum (L.), I think, therefore I exist.
comme il faut (Fr.), as it should be.
compos mentis (L.), sound of mind; quite sane.
compte rendu (Fr.), an account rendered; a report or statement drawn up.
conditio sine qua non (L.), a necessary condition.
conseil de famille (Fr.), a family consultation.
consensus facit legem (L.), consent makes the law.
consilio et animis (L.), by wisdom and courage.
consilio et prudentia (L.), by wisdom and prudence.
constantia et virtute (L.), by constancy and virtue.
contra bonos mores (L.), against good manners.
contretemps (Fr.), an unlucky accident; a hitch.
cordon bleu (Fr.), blue ribbon; a cook of the highest class.
cordon sanitaire (Fr.), a line of guards to prevent the spreading of contagion or pestilence.
corpus delicti (L.), the body or substance of a crime or offence.
corrigenda (L.), things to be corrected.
coup de grâce (Fr.), a finishing stroke.
coup d'état (Fr.), a sudden decisive blow in politics; a stroke of policy.
coup de soleil (Fr.), sunstroke.
credat Judæus Apella (L.), let Apella, the superstitious Jew, believe it (I won't); tell that to the marines.
cucullus non facit monachum (L.), the cowl does not make the friar.
cui bono? (L.), For whose advantage is it? to what end?
culpam pœna premit comes (L.), punishment follows hard upon crime.
cum grano salis (L.), with a grain of salt; with some allowance.
cum privilegio (L.), with privilege.
currente calamo (L.), with a fluent pen.
da locum melioribus (L.), give place to your betters.
damnant quod non intelligunt (L.), they condemn what they do not comprehend.
data et accepta (L.), expenditures and receipts.
de bon augure (Fr.), of good augury or omen.
de bonne grâce (Fr.), with good grace; willingly.

de die in diem (L.), from day to day.
de facto (L.), in point of fact; actual or actually.
dei gratia (L.), by God's grace.
de jure (L.), from the law; by right.
de mal en pis (Fr.), from bad to worse.
de novo (L.), anew.
deo volente (L.), God willing; by God's will.
de profundis (L.), out of the depths.
dernier ressort (Fr.), a last resource.
deus ex machina (L.), one who puts matters right at a critical moment; providential intervention.
dies non (L.), a day on which judges do not sit.
distingué (Fr.), distinguished; of genteel or elegant appearance.
dolce far niente (It.), sweet doing-nothing; sweet idleness.
double entente (Fr.), a double meaning; a play on words.
dramatis personæ (L.), characters of the drama or play.
dum spiro, spero (L.), while I breathe, I hope.
ecce homo! (L.), behold the man!
eheu! fugaces labuntur anni (L.), alas! the fleeting years glide by.
einmal ist keinmal (Ger.), just once doesn't count.
en avant (Fr.), forward.
en badinant (Fr.), in sport; in jest.
en déshabillé (Fr.), in undress.
en famille (Fr.), with one's family; in a domestic state.
enfant terrible (Fr.), a terrible child, or one that makes disconcerting remarks.
enfin (Fr.), in short; at last; finally.
en passant (Fr.), in passing; by the way.
en plein jour (Fr.), in broad day.
en rapport (Fr.), in harmony; in agreement; in relation.
en règle (Fr.), according to rules; in order.
entente cordiale (Fr.), cordial understanding, especially between two states.
entre nous (Fr.), between ourselves.
en vérité (Fr.), in truth; verily.
e pluribus unum (L.), one out of many; one composed of many.
esprit de corps (Fr.), the animating spirit of a collective body, as a regiment, learned profession or the like.
et sequentes, et sequentia (L.), and those that follow.
et tu, Brute! (L.), and thou also, Brutus!
ex animo (L.), heartily; sincerely.
ex capite (L.), from the head; from memory.
ex cathedra (L.), from the chair or seat of authority, with high authority.
exceptio probat regulam (L.), the exception proves the rule.
ex curia (L.), out of court.
ex dono (L.), by the gift.
exeunt omnes (L.), all go out or retire.
exit (L.), he goes out.
ex mero motu (L.), from his own impulse, from his own free will.
ex nihilo nihil fit (L.), out of nothing, nothing comes; nothing produces nothing.
ex officio (L.), in virtue of his office.
ex post facto (L.), after the deed is done; retrospective.
face à face (Fr.), face to face.
façon de parler (Fr.), manner of speaking.
faire bonne mine (Fr.), to put a good face upon the matter.
fait accompli (Fr.), a thing already done.
fama clamosa (L.), a current scandal; a prevailing report.
faute de mieux (Fr.), for want of better.
faux pas (Fr.), a false step; a slip in behaviour.
festina lente (L.), hasten slowly.
fiat justitia, ruat cœlum (L.), let justice be done though the heavens should fall.
fiat lux (L.), let there be light.
fide et amore (L.), by faith and love.
fide et fiduciâ (L.), by fidelity and confidence.
fide et fortitudine (L.), with faith and fortitude.
fidei defensor (L.), defender of the faith.
fide non armis (L.), by faith, not by arms.
fide, sed cui vide (L.), trust, but see whom.
fides et justitia (L.), fidelity and justice.
fides Punica (L.), Punic faith; treachery.
filius nullius (L.), a son of nobody; a bastard.
finis coronat opus (L.), the end crowns the work.
flagrante bello (L.), during hostilities.
flagrante delicto (L.), in the commission of the crime.
floreat (L.), let it flourish.
fons et origo (L.), the source and origin.
force majeure (Fr.), irresistible compulsion; war, strike, Act of God, etc.
forensis strepitus (L.), the clamour of the forum.
fortuna favet fortibus (L.), fortune favours the bold.
functus officio (L.), having performed one's office or duty; hence, out of office.
gaudeamus igitur (L.), so let us be joyful!
genius loci (L.), the genius or guardian spirit of a place.
gradu diverso, via una (L.), the same road by different steps.
grande parure / *grande toilette* (Fr.), full dress.
guerra al cuchillo (Sp.), war to the knife.
Hannibal ante portas (L.), Hannibal before the gates; the enemy close at hand.
hiatus valde deflendus (L.), a chasm or deficiency much to be regretted.
hic et nunc (L.), here and now.
hic et ubique (L.), here and everywhere.
hic jacet (L.), here lies.
hic labor, hoc opus est (L.), this is a labour, this is a toil.
hic sepultus (L.), here buried.
hoc genus omne (L.), all of this sort or class.
hoi polloi (Gr.), the many; the vulgar; the rabble.
hominis est errare (L.), to err is human.
homme de robe (Fr.), a man in civil office.
homme d'affaires (Fr.), a man of business.
homme d'esprit (Fr.), a man of wit or genius.
honi soit qui mal y pense (O. Fr.), evil to him who evil thinks.
honores mutant mores (L.), honours change men's manners or characters.
hors de combat (Fr.), out of condition to fight.
hors de propos (Fr.), not to the point or purpose.
hors-d'œuvre (Fr.), out of course; out of order.
ich dien (Ger.), I serve.
idée fixe (Fr.), a fixed idea.
id est (L.), that is.
il a le diable au corps (Fr.), the devil is in him.
Ilias malorum (L.), an Iliad of ills; a host of evils.
il penseroso (It.), the pensive man.
il sent le fagot (Fr.), he smells of the faggot; he is suspected of heresy.
imperium in imperio (L.), a state within a state; a government within another.
in actu (L.), in act or reality.
in articulo mortis (L.), at the point of death; in the last struggle.
in capite (L.), in chief.
in curia (L.), in court.
index expurgatorius / *index prohibitorius* (L.), a list of books prohibited to Roman Catholics.
in esse (L.), in being; in actuality.
in extenso (L.), at full length.
in extremis (L.), at the point of death.
in memoriam (L.), to the memory of; in memory.
in nubibus (L.), in the clouds.
in petto (It.), in (my) breast; to one's self.
in re (L.), in the matter of.
in sano sensu (L.), in a proper sense.
in situ (L.), in its original situation.
in vino veritas (L.), there is truth in wine; truth is told under the influence of intoxicants.

M.V.O. (5th); M.B.E.

Younger sons of the younger sons of Peers.

Baronets' younger sons.

Younger sons of Knights in order of their fathers.

Naval, Military, Air, and other Esquires by Office.

Women take the same rank as their husbands or as their eldest brothers; but the daughter of a Peer marrying a Commoner retains her title as Lady or Honourable. Daughters of Peers rank next immediately after the wives of their elder brothers, and before their younger brothers' wives. Daughters of Peers marrying Peers of lower degree take the same order of precedency as that of their husbands; thus the daughter of a Duke marrying a Baron becomes of the rank of Baroness only, while her sisters married to commoners retain their rank and take precedence of the Baroness. Merely official rank on the husband's part does not give any similar precedence to the wife. Dames Grand Cross (G.C.V.O. or G.B.E.) rank after wives of Baronets and before wives of Knights Grand Cross. Dames Commanders (D.C.V.O. or D.B.E.) rank after wives of Knights Grand Cross and before wives of Knights Commanders.

Precedence is formed by statute, patent, or usage, but the chief regulations regarding the order of precedence were settled by Parliament in the reign of Henry VIII.

Precedence locally, in county or city, has not been promulgated by written code, but in Counties the Lord Lieutenant stands first, and secondly the Sheriff, and therefore in Cities and Boroughs the Lord Lieutenant has social precedence over the Mayor; but at City or Borough functions the Lord Mayor or Mayor will preside. At Oxford and Cambridge the High Sheriff takes precedence of the Vice-Chancellor.

PRECEDENCE IN SCOTLAND

The Sovereign.

The Duke of Edinburgh.

The Duke of Rothesay (eldest son of the Sovereign).

Younger son of the Sovereign.

The Lord High Commissioner during sitting of General Assembly.

The Duke of Gloucester, the Duke of Windsor, uncles of the Sovereign.

CONSULS.

Begin: Sir.
Address: (Christian name and surname), Esq., H.B.M. Agent and Consul-General, *or* H.B.M. Consul-General, *or* H.B.M. Consul, *or* H.B.M. Vice-Consul.

GOVERNORS-GENERAL.

Begin: According to rank.
Address: His Excellency (ordinary designation), Governor of——.
Speak to as: Your Excellency.

PRIVY COUNCILLORS.

The courtesy title of "Right Honourable" is accorded all Privy Councillors (all members of the Cabinet are privy councillors, and the office is conferred for life). In the case of peers below the rank of Marquess, who already have a right to it in virtue of their peerage, the rank of Privy Councillor is indicated by the letters "P.C." after the name. Wives do not share the title.

Address: The Right Hon. ——.
Admiral the Right Hon. Sir ——.
Colonel the Right Hon. ——.
Air Vice-Marshal the Right Hon. Sir ——.
The Right Rev. the Right Hon. the Lord Bishop of ——.
The Most Hon. the Marquess of ——, P.C.

BUSINESS LETTERS.

Business letters to persons of rank can either be written in the third person (grammatical pitfalls must be guarded against), in which case they are not signed, or in the first person plural.

3rd person.
Messrs. —— present their compliments to the Right Hon. the Earl of —— and have pleasure in ——.

1st person plural.
Begin: Your Lordship.

ORDERS OF CHIVALRY

Garter
K.G.

The Most Noble Order of the Garter (1348). *Ribbon:* Garter blue, not worn in undress uniform. *Motto:* Honi soit qui mal y pense (*Evil to him who evil thinks*).

Thistle
K.T.

The Most Noble and Most Ancient Order of the Thistle (1687). *Ribbon:* Green, not worn in undress uniform. *Motto:* Nemo me impune lacessit (*No one provokes me with impunity*).

Saint Patrick
K.P.

The Most Illustrious Order of St. Patrick (1783). *Ribbon:* Sky blue, not worn in undress uniform. *Motto:* Quis separabit? (*Who shall separate?*).

Bath
G.C.B. (Knight Grand Cross), (Mil.& Civ).
K.C.B. (Knight Commander), (Mil. & Civ).
C.B. (Companion), (Mil.).

The Most Honourable Order of the Bath (1399). *Ribbon:* Crimson. *Motto:* Tria juncta in uno (*Three joined in one*). (Remodelled 1725 and 1815, and enlarged 13 times since.)

Order of Merit
O.M. (Mil. & Civ.)

The Order of Merit (1902). *Ribbon:* Blue and crimson. Ranks after G.C.B. before K.C.B.

Star of India
G.C.S.I. (Knight Grand Commander).
K.C.S.I. (Knight Commander).
C.S.I. (Companion).

The Most Exalted Order of the Star of India (1861). (Since enlarged 8 times.) *Ribbon:* Light blue, with white edges. *Motto:* Heaven's Light our Guide.

Saint Michael and Saint George
G.C.M.G. (Knight Grand Cross).
K.C.M.G. (Knight Commander).
C.M.G. (Companion).

The Most Distinguished Order of St. Michael and St. George (1818). *Ribbon:* Saxon blue, with scarlet centre. *Motto:* Auspicium melioris aevi (*Token of a better age*).

Indian Empire
G.C.I.E. (Knight Grand Commander).
K.C.I.E. (Knight Commander).
C.I.E. (Companion).

The Most Eminent Order of the Indian Empire (1877). (Since enlarged 8 times.) *Ribbon:* Imperial purple. *Motto:* Imperatricis auspiciis (*Under the auspices of the Empress*).

Victorian Order
G.C.V.O. (Knight or Dame Grand Cross).
K.C.V.O. (Knight Commander).
D.C.V.O. (Dame Commander).
C.V.O. (Commander).
M.V.O. (Member).

The Royal Victorian Order (1896). *Ribbon:* Blue, with red and white edges. *Motto:* Victoria.

British Empire
G.B.E. (Knight or Dame Grand Cross
K.B.E. (Knight Commander).
D.B.E. (Dame Commander).
C.B.E. (Commander).
O.B.E. (Officer).
M.B.E. (Member).

The Most Excellent Order of the British Empire (1917). *Ribbon:* Rose pink edged with pearl grey with vertical pearl stripe in centre (Mil. Div.); without vertical stripe (Civ. Div.). *Motto:* For God and the Empire.

Companions of Honour
C.H.

Order of the Companions of Honour (1917). *Ribbon:* Carmine, with gold edges. Ranks after G.B.E. and before K.B.E.

Victoria and Albert
V.A.

The Royal Order of Victoria and Albert (for Ladies) (1862). (Since enlarged 3 times.)

Crown of India
C.I.

The Imperial Order of the Crown of India (for Ladies) (1878). *Ribbon:* Light blue watered edged white, worn as bow on left shoulder.

UNITED KINGDOM COINAGE

The Royal Mint is authorised to issue coins of the following denominations and specifications :—

Denomination.	Standard Weight.
	Grains.
Gold:	
Five Pound Piece	616·37239
Two Pound Piece	246·54895
Sovereign	123·27447
Half Sovereign	61·63723
Cupro-Nickel:	
Crown	436·36363
Half-Crown	218·18181
Florin	174·54545
Shilling	87·27272
Sixpence	43·63636
Silver:	
Maundy Fourpence	29·09090
Maundy Threepence	21·81818
Maundy Twopence	14·54545
Maundy Penny	7·27272
Nickel Brass:	
Threepence	105·00000
Bronze:	
Penny	145·83333
Halfpenny	87·50000
Farthing	43·75000

Gold Coinage in Britain consists of eleven-twelfths of fine metal and one-twelfth of alloy: fineness, 916·66. Two hundred and forty troy ounces of standard gold are coined into 934 sovereigns and one half-sovereign; one troy ounce is, therefore, worth £3 17*s.* 10½*d.*, and one ounce of pure gold is nominally worth £4 4*s.* 11½*d.* The minimum weight at which a sovereign is allowed to remain current unchallenged is 122¼ grains; that of half-a-sovereign 61⅛ grains. Any person to whom it is tendered may break, cut, or deface any gold coin below the least current weight, but light gold coin which has not been illegally dealt with is received by the Bank of England on behalf of the Mint at its full face value.

Cupro-Nickel. The first change in the silver standard since the reign of Queen Elizabeth was made in 1920, when the degree of fineness was reduced to 500 parts in a thousand as against 925. 1946 marked the end of the silver coinage. To provide silver bullion for industry and for a fund towards the redemption of our silver debt to America the silver coins are to be withdrawn from circulation and gradually replaced by ones made of cupro-nickel, composed of 75% copper and 25% nickel. Maundy Money will, however, be raised to the original silver standard of 925 parts per 1000.

Bronze as employed in minting United Kingdom coins is an alloy of copper 95½ parts, tin 3 parts, and zinc 1½ parts.

Nickel Brass. The twelve-sided threepenny piece is composed of copper 79%, zinc 20%, and nickel 1%.

No person is permitted to coin any token to pass for, or as representing, any British piece of money under a penalty of £20.

New Coinage. A proclamation approving new designs for coinage was signed by H.M. the Queen in Council on November 25th, 1952. These coins became legal tender on January 1st, 1953, and include coin in gold as well as in silver, cupro-nickel, mixed metal, and bronze.

The principal design is that of the uncrowned head of Elizabeth II, which is the work of Mrs. Mary Gillick, C.B.E. This is used on the coinage of the United Kingdom, Canada, Australia, New Zealand, South Africa, Ceylon, and Southern Rhodesia, though the inscriptions vary in each country. The Queen is shown wearing a laurel wreath tied at the back with a flowing ribbon above two rows of curls at the nape of the neck. The inscription on the obverses of the cupro-nickel coins issued after the 1st January, 1954, reads "ELIZABETH · II · DEI · GRATIA · REGINA" and on the obverses of the gold, silver, nickel-brass and bronze coins "ELIZABETH · II · DEI · GRATIA · REGINA · F : D :".

The reverse sides of the coins are as follows:—

Half-crown, shield of the Royal Arms surmounted by the Crown; prepared by Mr. E. G. Fuller and modelled by Mr. Cecil Thomas, F.R.B.S.

Florin, circular pattern of thistles, shamrock, and leeks about a double rose. This is the first time a Welsh emblem has decorated the United Kingdom coinage as an integral part of the design; prepared by Mr. E. G. Fuller and modelled by Mr. Cecil Thomas, F.R.B.S.

Shilling, shield of the English quartering of the Royal Arms surmounted by the Crown; design prepared and modelled by Mr. W. M. Gardner. The Scottish shilling shows a shield of the Scottish quartering of the Royal Arms surmounted by the Crown; also designed and modelled by Mr. W. M. Gardner.

Sixpence, garland of interlaced rose, thistle, shamrock, and leek, designed by Mr. E. G. Fuller and modelled by Mr. Cecil Thomas, F.R.B.S.

Threepenny piece, chained portcullis surmounted by a coronet, designed and modelled by Mr. W. M. Gardner.

There is no change on the reverse of the bronze coinage (coppers), which will continue to bear, on the *penny*, the figure of Britannia, familiar since Charles II; on the *half-penny*, a sailing-ship inspired by the *Golden Hind*, designed by Mr. T. H. Paget, O.B.E., and on the *farthing* the wren of Mr. Wilson Parker.

The coins of Colonial territories, in accordance with tradition, bear the crowned head of the Sovereign, designed for the present Reign by Mr. Cecil Thomas, F.R.B.S.

The *five-shilling pieces* issued to commemorate the Coronation bore on the obverses an equestrian effigy of Her Majesty by Mr. Gilbert Ledward, R.A., and on the reverses a design by Mr. E. G. Fuller modelled by Mr. Cecil Thomas, F.R.B.S. of the four quarterings of the Royal Arms each contained in a shield and arranged in saltire with, in the intervening spaces, a rose, a thistle, a sprig of shamrock and a leek. Upon the edges of the coins was the inscription, "FAITH AND TRUTH I WILL BEAR UNTO YOU".

The designs specified for *crown pieces* issued after the 1st January, 1954 are Mrs. Gillick's uncrowned effigy for the obverses and the same design as shown on the reverses of the Coronation crown pieces for the reverses.

LEGAL TENDER

Bank of England Notes are issued for sums of 10*s.* £1, and £5. 10*s.* and £1 bank-notes are legal tender in Great Britain and Northern Ireland, and £5 bank-notes (if dated September 2nd, 1944, or after) in England and Wales only. £5 notes dated prior to September 2nd, 1944, and all notes of higher denominations have ceased to be legal tender; they are, however, still exchangeable at the Bank.

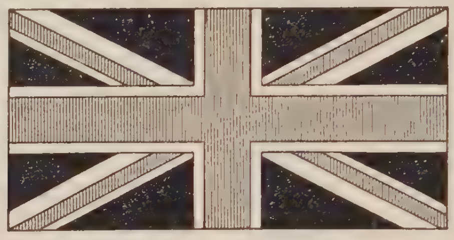
Gold Coins if not below the minimum current weight, are legal tender; but, unless otherwise authorised by or on behalf of the Treasury, persons resident in the United Kingdom holding sovereigns or other gold coin must, under the Exchange Control Act, 1947, offer that coin for sale to an Authorised Dealer.

Silver and/or Cupro-Nickel Coins are legal tender for sums not exceeding £2, nickel-brass threepenny pieces for sums not exceeding 2*s.*, and bronze coins, including farthings, for sums not exceeding 1*s.* No one can demand "change".

Treasury Notes of the value of 10*s.* and £1, which were first issued during the First World War, ceased to be issued in November 1928; though no longer legal tender, they remain exchangeable at the Bank of England.

THE UNION JACK

The present Union Jack is composed of three heraldic crosses, viz., the cross of St. Andrew, forming the blue and white basis; upon which lies the red and white cross of St. Patrick; and upon the whole rests the red and white cross of St. George, dividing the flag vertically and horizontally. The original Union Jack combined only the St. George and St. Andrew crosses and was adopted in 1606 by order of James I. who as James VI. of Scotland succeeded to the throne of England in 1603. No further alteration was made in the flag until January 1st, 1801, when the Irish Parliament was dissolved and the Act of Union came into force.



It is flown on the following days on Government and Public buildings (from 8 a.m. to sunset) :—

Feb.	6 (1952)	H.M. the Queen's Accession.
,,	19 (1960)	Prince Andrew's Birthday.
Mar.	31 (1900)	Duke of Gloucester's Birthday.
Apr.	21 (1926)	Birthday of H.M. the Queen.
,,	25 (1897)	Princess Royal's Birthday.
May	24	Empire Day.
June	2 (1953)	Coronation Day.
June	10 (1921)	Duke of Edinburgh's Birthday.
Aug.	4 (1900)	Birthday of H.M. Queen Elizabeth the Queen Mother.
,,	15 (1950)	Princess Anne's Birthday.
,,	21 (1930)	Princess Margaret's Birthday.
Nov.	14 (1948)	Prince Charles' Birthday.
,,	20 (1947)	The Royal Wedding Day.

and on the occasion of the "official" Queen's birthday, Remembrance Day and the opening and closing of Parliament by the Queen.

The *Royal Standard* is hoisted on buildings in which Her Majesty the Queen is actually present.

THE BEAUFORT SCALE OF WIND FORCE

Beaufort number	*Wind*	*Effect on land*	*Speed*	
			M.p.h.	*Knots*
0	Calm	Smoke rises vertically	Less than 1	Less than 1
1	Light air	Direction shown by smoke but not by wind vanes	1–3	1–3
2	Light breeze	Wind felt on face; leaves rustle; wind vanes move	4–7	4–6
3	Gentle breeze	Leaves and twigs in motion; wind extends light flag	8–12	7–10
4	Moderate breeze	Raises dust, loose paper and moves small branches	13–18	11–16
5	Fresh breeze	Small trees in leaf begin to sway	19–24	17–21
6	Strong breeze	Large branches in motion; whistling in telegraph wires; difficulty with umbrellas	25–31	22–27
7	Moderate gale	Whole trees in motion; difficult to walk against wind	32–38	28–33
8	Fresh gale	Twigs break off trees; progress impeded	39–46	34–40
9	Strong gale	Slight structural damage occurs; chimney pots and slates blown off	47–54	41–47
10	Whole gale	Trees uprooted and considerable structural damage	55–63	48–56
11	Storm	Widespread damage, seldom experienced in England	64–75	57–65
12	Hurricane	Winds of this force only encountered in tropical revolving storms	Above 75	Above 65

WEIGHTS AND MEASURES.

I. WEIGHTS AND MEASURES LEGALLY PERMITTED UNDER THE WEIGHTS AND MEASURES ACTS.

I. IMPERIAL WEIGHTS AND MEASURES.

AVOIRDUPOIS.

1 dram (dr.)	27·34375 grains (gr.)
16 drams	1 ounce (oz.) = 437·5 gr.
16 ounces	1 pound (lb.) = 7000 gr.
14 pounds	1 stone
28 pounds	1 quarter
4 quarters	1 hundredweight (cwt.) = 112 lb.
20 hundredweight	1 ton = (2240 lb.)

TROY WEIGHT.

1 pennyweight (dwt.)	24 grains
480 grains	1 ounce

The only unit of troy weight which is now legal for use in trade in this country is the ounce Troy, and weighings of precious metals are made in multiples and decimals of this unit.

The term *carat* is not a unit of weight for precious metals, but is used to denote the quality of gold plate, etc., and is a figure indicating the number of 24ths of pure gold in the alloy, *e.g.*, a 9 carat gold ring consists of nine parts of pure gold and fifteen parts of base metals.

CAPACITY MEASURE.

4 gills	1 pint
2 pints	1 quart
4 quarts	1 gallon
2 gallons	1 peck
4 pecks	1 bushel
8 bushels	1 quarter
36 bushels	1 chaldron

There is no legal equivalent of the gallon in terms of cubic inches, but the most up-to-date scientific determination gives the figure 1 gallon = 277·420 cubic inches.

APOTHECARIES' WEIGHT.

20 grains	1 scruple
3 scruples	1 drachm
8 drachms	1 ounce

While the apothecaries' ounce is the same as the troy ounce, there is no such thing as an apothecaries' or troy pound of 12 ounces. The troy pound has been obsolete for many years.

The Avoirdupois system is normally used for retailing chemicals in quantities of a ¼ ounce and over, whilst the metric system is used for the newer drugs. The metric system (with apothecaries' equivalents) is also used for formulæ and prescriptions in the *British Pharmacopœia.*

APOTHECARIES' FLUID MEASURE.

60 minims (min.)	1 fluid drachm
8 fluid drachms	1 fluid ounce
20 fluid ounces	1 pint

There are 437½ grains weight of distilled water at 62° F. in 1 fluid ounce.

LINEAR MEASURE.

1 nail	1/16 yard
1 link	7·92 inches
12 inches	1 foot
3 feet	1 yard
5½ yards	1 rod, pole, or perch
4 rods, etc.	1 chain or 100 links (22 yd.)
220 yards	1 furlong
8 furlongs	1 mile = 1760 yards

SQUARE MEASURE.

144 sq. inches	1 sq. foot
9 sq. feet	1 sq. yard = 1296 sq. inches
30¼ sq. yards	1 sq. rod, pole, or perch
40 sq. rods	1 rood
4 roods	1 acre = 4840 sq. yards
640 acres	1 sq. mile

(To convert decimal parts of an acre into roods and perches, multiply by 4 to give roods and decimals of a rood, and multiply this decimal by 40, to give perches and decimals of a perch.)

CUBIC OR SOLID MEASURE.

1728 cu. inches	1 cu. foot
27 cu. feet	1 cu. yard

The relationship between the yard and the bushel is not legally defined. A relationship (based on that of the gallon in "Capacity Measure" above) would be 1 cu. yard = 21·022 bushels.

The *Reputed Quart* (6 per Imperial Gallon) and the *Reputed Pint* (12 per Imperial Gallon) are the sizes of most of the "bottles" and "half-bottles" in which wines and spirits are usually sold.

2. METRIC WEIGHTS AND MEASURES.

LINEAR MEASURE.

10 millimetres (mm.)	1 centimetre (cm.)
10 centimetres	1 decimetre (dm.)
10 decimetres	1 METRE (m.)
10 metres	1 dekametre (dam.)
10 dekametres	1 hectometre (hm.)
10 hectometres	1 kilometre (km.)

SURFACE OR SQUARE MEASURE.

100 centiares	1 are = 100 sq. metres
100 ares	1 hectare = 10,000 sq. metres

CAPACITY.

10 millilitres (ml.)	1 centilitre (cl.) = 10 c.c.
10 centilitres	1 decilitre (dl.) = 100 c.c.

CAPACITY (*cont.*).

10 decilitres	1 LITRE (lit.) = 1000 c.c.
10 litres	1 dekalitre (dal.)
10 dekalitres	1 hectolitre (hl.)
10 hectolitres	1 kilolitre (kl.) = 1 cu. metre

WEIGHT.

1000 micrograms	1 milligram (mg.)
10 milligrams	1 centigram (cg.)
10 centigrams	1 decigram (dg.)
10 decigrams	1 GRAM (gm.)
10 grams	1 dekagram (dag.)
10 dekagrams	1 hectogram (hg.)
10 hectograms	1 kilogram (kg.)
The metric carat	0·2 gram

3. IMPERIAL AND METRIC EQUIVALENTS.

LINEAR MEASURE.

IMPERIAL TO METRIC.

1 inch	2·54 centimetres
1 foot	30·48 centimetres
1 yard	0·914399 metre
1 pole (5½ yards)	5·0292 metres
1 chain (22 yards)	20·1168 metres
1 furlong (220 yards)	201·168 metres
1 mile (8 furlongs)	1·6093 kilometres

METRIC TO IMPERIAL.

1 millimetre	0·03937 inch
1 centimetre	0·3937 inch
1 decimetre	3·937 inches
1 metre	39·370113 inches.
1 metre	3·280843 feet
1 metre	1·0936143 yards
1 dekametre	10·936 yards
1 hectometre	109·36 yards
1 kilometre	0·62137 mile

SQUARE MEASURE.

Imperial to Metric.		Metric to Imperial.	
1 sq. inch	6·4516 sq. cm.	1 sq. cm.	0·15500 sq. inch
1 sq. foot	9·2903 sq. decimetres	1 sq. metre	10·7639 sq. feet
1 sq. yard	0·836126 sq. metre	1 sq. metre	1·1960 sq. yards
1 sq. rod (30¼ sq. yd.)	25·293 sq. metres	1 are (100 sq. metres)	119·60 sq. yards
1 rood (40 sq. rods)	10·117 ares	1 hectare (100 ares or 10,000 sq. metres)	2·4711 acres
1 acre (4,840 sq. yd.)	0·40468 hectare		
1 sq. mile (640 acres)	259·00 hectares		

CUBIC MEASURE.

Imperial to Metric.		Metric to Imperial.	
1 cu. inch	16·387 cu. cm.	1 cu. centimetre	0·0610 cu. inch
1 cu. foot (1728 cu. in.)	0·028317 cu. metre	1 cu. decimetre (1000 cu. cm.)	61·024 cu. inches
1 cu. yard (27 cu. ft.)	0·764553 cu. metre	1 cu. metre	35·3148 cu. feet
		1 cu. metre	1·307954 cu. yards

CAPACITY MEASURE.

Imperial to Metric.		Metric to Imperial.	
1 gill	1·42 decilitres	1 centilitre	0·070 gill
1 pint	0·568 litre	1 decilitre	0·176 pint
1 quart	1·136 litres	1 litre	1·75980 pints
1 gallon	4·5459631 litres	1 dekalitre	2·200 gallons
1 peck (2 gallons)	9·092 litres	1 hectolitre	2·75 bushels
1 bushel (8 gallons)	3·637 dekalitres		
1 quarter (8 bushels)	2·909 hectolitres		

Note: One litre = 1000·027 c.c.; one millilitre = 1 c.c.

APOTHECARIES' MEASURE.

Imperial to Metric.		Imperial to Metric.	
1 minim	0·059 millilitre	1 pint	0·568 litre
1 fluid scruple	1·184 millilitres	1 gallon (8 pints or 160 fluid ounces)	4·5459631 litres
1 fluid drachm (60 minims)	3·552 millilitres		
1 fluid ounce (8 drachms)	2·84123 centilitres		

AVOIRDUPOIS WEIGHT.

Imperial to Metric.		Metric to Imperial.	
1 grain	0·0648 gram	1 milligram	0·015 grain
1 dram	1·772 grams	1 centigram	0·154 grain
1 ounce (16 drams)	28·350 grams	1 decigram	1·543 grains
1 pound (16 ounces or 7000 grains)	0·45359243 kilogram	1 gram	15·432 grains
1 stone (14 lb.)	6·350 kilograms	1 dekagram	5·644 drams
1 quarter (28 lb.)	12·70 kilograms	1 hectogram	3·527 ounces
1 cwt. (112 lb.)	50·80 kilograms = 0·5080 quintal	1 kilogram (1000 gm.)	2·2046223 lb. or 15,432·3564 grains
1 ton (20 cwt.)	1·0160 tonnes or 1016 kilograms	1 myriagram (10 kg.)	22·046 lb.

1 drachm (3 scruples)	3·888 grams	1 gram	15·432 grains
1 ounce (8 drachms)	31·1035 grams		

II. ELECTRICAL UNITS.

Until 31st December, 1947, the electrical units in general use were the so-called International Units, having been defined by the International Conference on Electrical Units held in London in 1908. These units were based upon specifications for a column of mercury and a silver voltameter which defined the International Ohm and International Ampere respectively, as units which for practical purposes could be accepted as equivalent to the fundamental theoretical units derived by multiplying the corresponding centimetre, gram, second (C.G.S.) electromagnetic unit by an integral power of ten. The International Units were not exactly equal to the fundamental units, and as the accuracy of all measurements increased, the discrepancy became increasingly troublesome.

The International Committee of Weights and Measures, which had succeeded the 1908 Conference, met in Paris in 1946 and decided to abolish the International Units, and as from 1st January, 1948, to use throughout the world the fundamental units themselves, which are known as Absolute Units. The decision meant that the units in common use at that time changed by various amounts up to 5 parts in 10,000.

The International Units and corresponding Absolute Unit values are as follows:—

Ohm. The International Ohm is the resistance offered to an unvarying current by a column of mercury of height 106·3 cm., 1 sq. mm. cross-section and weight 14·4521 grams at the temperature of melting ice (0° C.).

1 International Ohm = 1·00049 Absolute Ohm.

1 Absolute Ohm = 10^9 C.G.S. electromagnetic units.

1,000,000 Ohms = 1 Megohm.

Ampere. The International Ampere is that steady current which in flowing through a specified solution of silver nitrate, deposits silver on the cathode at the rate of 0·001118 gram per second.

1 International Ampere = 0·99985 Absolute Ampere.
1 Absolute Ampere = 0·1 C.G.S. electromagnetic unit.

Volt. The International Volt is that steady electromotive force which applied to the ends of a conductor, whose resistance is 1 International Ohm, causes a current of 1 International Ampere to flow.

1 International Volt = 1·00034 Absolute Volt.
1 Absolute Volt = 10^8 C.G.S. electromagnetic units.
1000 volts = 1 Kilovolt.

Watt. Energy is supplied to a circuit at the rate of 1 International Watt if the current in it is 1 International Ampere and the pressure across it is 1 International Volt.

1 International Watt = 1·00019 Absolute Watt.
1000 watts = 1 Kilowatt.
1 Kilowatt-hour = 1000 watts supplied for a period of 1 hour = Board of Trade Unit.

Coulomb. The unit of quantity, and is the quantity passing in 1 second when the mean current is 1 ampere.

1 Coulomb = 0·1 electromagnetic unit.

Henry. The unit of inductance, defined as the inductance of a circuit in which the induced electromotive force is 1 volt when the inducing current changes at the rate of 1 ampere per second.

1 International Henry = 1·00049 Absolute Henry.
1 Absolute Henry = 10^9 C.G.S. electromagnetic units.

Farad. The unit of capacity, and is that capacity which is charged to a difference of pressure of 1 volt by 1 coulomb.

1,000,000 microfarads = 1 farad.
1 International Farad = 0·99951 Absolute Farad.
1 Absolute Farad = 10^9 C.G.S. electromagnetic unit.

STANDARD SIZES OF BRITISH BOOKS

Size	Abbreviation	Inches
Foolscap octavo	F8	6¾ × 4¼
Crown octavo	C8	7½ × 5
Large crown octavo	lC8*	8 × 5¼

HOW TO CORRECT PRINTERS' PROOFS

Marginal mark	Meaning	Corresponding mark in text
δ/	Delete (take out)	Cross through
δ	Delete and close-up	Above and below letters to be taken out
stet	Leave as printed (when words have been crossed out by mistake)	. . . . Under letters or words to remain
caps	Change to capital letters	Under letters or words to be altered
s.c.	Change to small capitals	Under letters or words to be altered
caps & s.c.	Use capital letters for initial letters and small capitals for rest of words	Under initial letters and under the rest of the words
l.c.	Change from capitals to lower case	Encircle letters to be altered
bold	Change to bold type	Under letters or words to be altered
ital.	Change to italics	Under letters or words to be altered
rom.	Change to roman type	Encircle words to be altered
w.f.	(Wrong fount.) Replace by letter of correct fount	Encircle letter to be altered
	Invert type	Encircle letter to be altered
X	Replace by similar but undamaged character	Encircle letter to be altered
	Insert (or substitute) superior figure or sign	⋏ (Or encircle letters or signs to be altered)
	Insert (or substitute) inferior figure or sign	⋏ (Or encircle letters or signs to be altered)
	Close-up—delete space between letters	Linking words or letters
#	Insert space	⋏
eq.#	Make spacing equal	Between words
less#	Reduce space	Between words
trs.	Transpose	Between letters or words, numbered when necessary
centre	Place in centre of line	Indicate position with
	Move to the left	
	Move to the right	
n.p.	Begin a new paragraph	Before first word of new paragraph
run on	No fresh paragraph here	Between paragraphs
spell out	The abbreviation or figure to be spelt out in full	Encircle words or figures to be altered
⋏	(Caret mark.) Insert matter indicated in margin	⋏
' '	Insert single quotation marks	⋏ ⋏
" "	Insert double quotation marks	⋏ ⋏

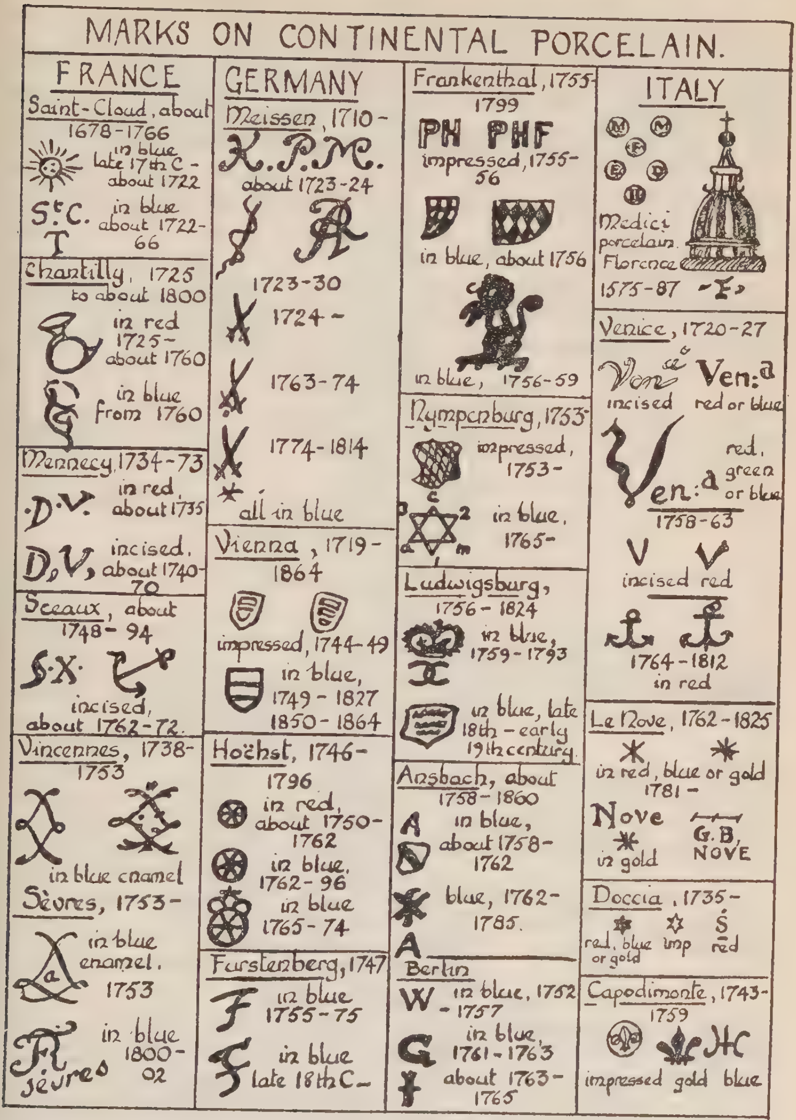
SCOTTISH AND IRISH SILVER MARKS

EDINBURGH . .	1700		1800	
GLASGOW . .	1700		1800	
DUBLIN . .	1700		1800	

The earliest fully-developed factory-mark is that of late-16th-century Italian porcelain made at Florence, but it was not until 1724, when the Meissen factory adopted the crossed swords from the arms of Saxony, that the practice was generally taken up by most pottery factories worthy of note.

In 1766 French manufacturers were compelled by law to mark their products with a mark previously registered with the police, but elsewhere marks similar to those of the reputable factories were adopted. Many factories used marks designed to look like the crossed swords of Meissen, whilst the English factories of Bow, Lowestoft, Derby, and Worcester made no attempt to disguise their occasional use of the device.

Many initials and numerals often found on porcelain are no aid to the identification of its place of manufacture and are merely the mark of a workman for factory or record purposes, pattern or mould numbers. The safest mark to accept as genuine is that which has been incised or



Drawn by J. P. Cushion, Victoria and Albert Museum.

stamped in the paste before firing and subsequently glazed.

The most widely used method of marking wares during the 18th century was by painting or printing in underglaze-blue which is generally accepted as authentic, but all painted, printed, or stencilled marks applied over the glaze could be added to a piece with the intention of deceiving. Any refiring of old wares is generally revealed by black specks in the glaze.

German porcelain of the eighteenth century particularly lends itself to forgery due to the hard-paste material then used still being available, and reproductions were made throughout the 19th century, but all tend to have an over-clean finish not in keeping with the original. Chelsea wares were also widely copied but owing to the soft-paste used for their manufacture are far easier to detect when produced in the harder material. *See also* **Porcelain, Gen. Information.**

BANK AND PUBLIC HOLIDAYS

In *England, Wales, N. Ireland* and *The Channel Islands* it is ordained that the Bank Holidays shall be: Easter Monday, Whit Monday, first Monday in August, Boxing Day (first weekday after Christmas). The Channel Islands have in addition special Bank Holidays on New Year's Day and Liberation Day.

N. Ireland and the *Irish Republic* have a special Bank Holiday on St. Patrick's Day, March 17th.

The Stock Exchange is closed on Bank Holidays Good Friday, January 1st and on Saturdays throughout the year.

The Queen's birthday (when decreed) is observed in the Customs and certain other Government establishments as a holiday.

	1960.	1961.
Easter Monday	Apr. 18	Apr. 3
Whit Monday	June 6	May 22

In *Scotland* it is enacted that the Bank Holidays observed shall be: New Year's Day, first Monday in May, first Monday in August. There are also special Spring and Autumn holidays in Edinburgh and Glasgow.

	1960.	1961.
1st Monday in Aug.	Aug. 1	Aug. 7
Boxing Day	Mon. Dec. 26	Tues. Dec. 26

THE SEASONS

1960.

Vernal Equinox—Spring begins Mar. 20, 3 p.m.
Summer Solstice—Summer begins June 21, 10 a.m.
Autumnal Equinox—Autumn begins Sept. 23, 1 a.m.
Winter Solstice—Winter begins Dec. 21, 8 p.m.

1961.

Vernal Equinox—Spring begins Mar. 20, 8 p.m.
Summer Solstice—Summer begins June 21, 4 p.m.
Autumnal Equinox—Autumn begins Sept. 23, 7 a.m.
Winter Solstice—Winter begins Dec. 22, 2 a.m.

GAME

Game is defined under the game laws as including hares, pheasants, partridges, grouse, heath or moor game, black game, deer, rabbits and (in Scotland) ptarmigan. The close times for game are as follows (the dates given are inclusive).

Black (or Heath) Game	Dec. 11 to Aug. 19 (Aug. 31 in Somerset, Devon, and New Forest).
Grouse (or Moor Game) and (in Scotland) Ptarmigan	Dec. 11 to Aug. 11.
Partridge	Feb. 2 to Aug. 31.
Pheasant	Feb. 2 to Sept. 30.

Deer, hares and rabbits are also protected to a limited extent.

CLOSE TIMES FOR SPORTING BIRDS

Birds for which the close season is Feb. 1 to Aug. 31 (inclusive):—

Godwit, bar-tailed; Plover, grey; Coot; Redshank, common; Curlew (other than Stone Curlew); Moorhen; Whimbrel; Plover, golden

Birds for which the close season is Feb. 1 to Aug. 31 (inclusive) (except below high water mark when it is Feb. 21 to Aug. 31 (inclusive):

Wild duck of the following species:—

Common pochard	Long-tailed duck	Teal
Common Scoter	Mallard	Tufted Duck
Gadwall	Pintail	Velvet Scoter
Garganey Teal	Scaup-duck	
Goldeneye	Shoveler	Wigeon

Wild geese of the following species:—

Bean-goose	Grey Lag Goose	White-fronted Goose
Canada Goose	Pink-footed Goose	

Birds for which the close season is Feb. 1 to Sept. 30 (inclusive):—

Capercaillie; Woodcock (in Scotland Feb. 1 to Aug. 31).

Birds for which the close season is Feb. 1 to Aug. 11 (inclusive):—

Snipe, common; Snipe, jack.

THE COUNTRY CODE

GUARD AGAINST THE RISK OF FIRE. Great damage is done every year to crops, plantations, woodlands, and heaths. A match or cigarette thrown away or a pipe carelessly knocked out, picnic fires not properly put out or lighted near dry crops, can quickly start a blaze.

FASTEN ALL GATES. If animals get out of a field they stray. As a result they may do serious damage to crops, suffer injury on the roads, or eat food that is harmful.

KEEP DOGS UNDER CONTROL. Animals are easily frightened, even by small, playful dogs. Stillbirths may be the result.

KEEP TO THE PATHS ACROSS FARM LAND. Crops are damaged by treading; flattened crops are difficult to harvest. Grass is a valuable crop.

AVOID DAMAGING FENCES, HEDGES, AND WALLS. If these are damaged, gaps will be caused. Where a man goes, an animal may follow.

LEAVE NO LITTER. Litter is not just unsightly, but often a danger as well. Broken glass and tins may injure animals and harm machinery.

SAFEGUARD WATER SUPPLIES. Countrymen often depend on wells and streams for water for themselves and for their animals.

PROTECT WILD LIFE, PLANTS, AND TREES. Wild animals should not be disturbed, plants uprooted, or trees treated roughly.

GO CAREFULLY ON COUNTRY ROADS. If there is no footpath, walkers are generally safer on the right, facing on-coming traffic. Care and patience are needed by motorists when passing farm animals.

RESPECT THE LIFE OF THE COUNTRYSIDE. Many of the machines and much of the business stock on which the farmer depends for his livelihood have to be kept in the open. Take care not to damage them.

UNIVERSITY DEGREES—COLOURS OF HOODS

Aberdeen

M.A.	Black corded silk lined with white silk and edged round cape and cowl.
D.Litt.	Scarlet superfine cloth lined with white silk.
B.D.	Black corded silk lined with purple silk.
D.D.	Scarlet superfine cloth lined with purple silk.
B.L.	Black corded silk edged with light blue silk.
LL.B.	Black corded silk lined with light blue silk.
LL.D.	Scarlet superfine cloth lined with light blue silk.
M.B., Ch.B.	Black corded silk lined with crimson silk.
Ch.M.	White corded silk lined with crimson silk.
M.D.	Scarlet superfine cloth lined with crimson silk.
B.Sc.	Black corded silk lined with green silk.
D.Sc.	Scarlet superfine cloth lined with green silk.
B.Sc.(Agric.)	Black corded silk edged with green silk.
B.Sc.(Eng.)	Black corded silk with green and white silk.
B.Sc.(For.)	Black corded silk with waved green silk edging.
B.Com.	Black corded silk edged with lilac silk.
Ph.D.	Scarlet superfine cloth lined with black ribbed silk.

Note:—All the hoods of this university are of the full type, with rounded capes, but have no liripipe to the cowl or hood portion proper.

Belfast, The Queen's University

B.A.	Black ribbed silk edged with white fur and the neck edged with watered blue silk.
M.A.	Black ribbed silk lined and edged with watered blue silk.
D.Litt.	Scarlet superfine cloth lined with white silk and edged with watered blue silk.
B.D.	Black ribbed silk lined with white silk and edged with watered blue silk.
D.D.	Scarlet superfine cloth lined with black silk and edged with watered blue silk.
LL.B.	Black ribbed silk lined with pink silk and edged with watered blue silk.
LL.D.	Scarlet superfine cloth lined with pink silk and edged with watered blue silk.
M.B., B.Ch., B.A.O.	Black ribbed silk lined with scarlet silk and edged with watered blue silk.
M.Ch.	Ribbed red silk lined with white silk and edged with watered blue silk.
M.D.	Scarlet superfine cloth lined with scarlet silk and edged with watered blue silk.
M.A.O.	Black ribbed silk lined with purple silk and edged with watered blue silk.
B.Mus.	Blue silk lined with white silk and edged with watered blue silk.
D.Mus.	Scarlet superfine cloth lined with blue silk and edged with watered blue silk.
Ph.D.	Scarlet superfine cloth lined with violet silk and edged with watered blue silk.
B.Sc.	Black ribbed silk lined with green silk and edged with watered blue silk.
M.Sc.	Ribbed red silk lined with green silk and edged with watered blue silk.
D.Sc.	Scarlet superfine cloth lined with green silk and edged with watered blue silk.
B.Sc.(Econ.)	Black ribbed silk lined with rose pink silk and edged with watered blue silk.
M.Sc.(Econ.)	Rose pink silk lined with white silk and edged with watered blue silk.
B.D.S.	Black ribbed silk lined with grey silk and edged with watered blue silk.
B.Agric.	Black ribbed silk lined with yellow silk and edged with watered blue silk.
M.Agric.	Red ribbed silk lined with yellow silk and edged with watered blue silk.

Note:—Bachelors' and Masters' hoods are of the simple shape and Doctors' of the full shape. All the hoods have the neck portion at least edged with the pale blue watered silk peculiar to this University.

Birmingham

B.A.	Black ribbed silk lined for 3″ with watered electric blue.
M.A.	Black ribbed silk fully lined with watered electric blue.
B.D.	Black ribbed silk lined with watered cobalt blue.
D.D.	Scarlet superfine cloth lined with watered cobalt blue.
LL.B.	Black ribbed silk lined for 3″ with watered bronze green silk.
LL.M.	Black ribbed silk fully lined with watered bronze green silk.
LL.D.	Scarlet superfine cloth lined with watered bronze green silk.
M.B., Ch.B.	Black ribbed silk lined for 3″ with watered cardinal silk.
Ch.M.	Black ribbed silk fully lined with watered cardinal silk.
M.D.	Scarlet superfine cloth lined with watered cardinal silk.
B.Mus.	Black ribbed silk lined for 3″ with watered orange silk.
D.Mus.	Scarlet superfine cloth lined with watered orange silk.
Ph.D.	Crimson cloth, lined with the watered silk of the Faculty.
B.Sc.	Black ribbed silk lined for 3″ with watered grey silk.
M.Sc.	Black ribbed silk fully lined with watered grey silk.
D.Sc.	Scarlet superfine cloth lined with watered grey silk.
D.Litt.	Scarlet superfine cloth lined with watered electric blue silk.
B.D.S.	Black ribbed silk lined for 3″ with watered dark red silk.
M.D.S.	Black ribbed silk fully lined with watered dark red silk.
B.Com.	Black ribbed silk lined for 3″ with watered terra-cotta silk.
M.Com.	Black ribbed silk fully lined with watered terra-cotta silk.
B.Soc.Sc., M.Soc.Sc.	Follow the scheme for Bachelors and Masters above with 3″ of the watered silk of the Faculty.

Note:—All hoods are of the full shape, similar to London, all the capes having well-rounded corners.

Bristol

B.A., M.A., LL.B., LL.M., LL.D., M.B., Ch.B., Ch.M., M.D., B.Mus., D.Mus., Ph.D., B.Sc., M.Sc., D.Sc., D.Litt., B.D.S., M.D.S., B.Sc.(Dom.Sc.), B.V.Sc., B.A.(Econ.)

All hoods are of the full shape, similar to Cambridge. Hoods are made of the University's special red stuff or silk. Bachelor's hoods are partly lined with a silk of a somewhat lighter shade of University red. Masters' hoods are fully lined with white silk, and Doctors' are fully lined with salmon-coloured silk. The M.B., Ch.B. hood is fully lined with light red silk and edged inside the hood proper with ¾″ of white silk. The LL.B. hood is fully lined with the lighter shade of University red and edged with ¾″ violet silk. The B.Mus. hood is fully lined with lavender silk and edged with ¾″ lavender silk. The Ph.D. hood is of red silk fully lined with dark violet silk. [This is an unconventional system.]

Cambridge

B.A.	Black corded ottoman silk lined with white fur.
M.A.	Black corded ottoman silk lined with fine ribbed white silk.
B.D.	Black corded ottoman silk lined with fine ribbed black silk.
D.D.	Scarlet superfine cloth lined with shot silk lilac shade.
LL.B.	Light cerise silk lined with white fur.
LL.M.	Black corded ottoman silk lined with light cerise silk.
LL.D.	Scarlet superfine cloth lined with light cerise silk.
M.B., B.Ch.	Mid-cerise silk lined with white fur.
M.Ch.	Black corded ottoman silk lined with mid-cerise silk.
M.D.	Scarlet superfine cloth lined with mid-cerise silk.
Mus.B.	Deep cherry coloured satin lined with white fur.
Mus.M.	Black corded ottoman silk lined with deep cherry coloured satin.
Mus.D.	Cream figured damask silk lined with deep cherry coloured satin.
M.Sc.	Black cloth lined with shot silk (pink with blue).
Sc.D.	Scarlet superfine cloth lined with shot silk (pink with blue).
M.Litt.	Black cloth lined with deep cerise silk (scarlet).
Litt.D.	Scarlet superfine cloth lined with deep cerise silk (scarlet).
Ph.D.	Black corded ottoman silk lined with scarlet superfine cloth.

Note:—All hoods are of the full shape. Edging is forbidden. Cambridge Law degrees are in LAW (not LAWS).

The University of Dublin (Trinity College)

B.A.	Black, White Fur, White.
M.A.	Black, Dark Blue.
B.D.	Black and Black Silk.
D.D.	Scarlet and Black Silk.
LL.B.	Black and White.
LL.D.	Scarlet, Pink.
M.B., B.Ch. B.A.O.	Black, Crimson.
M.Ch.	Crimson, White, Blue.
M.A.O.	Black, Purple.
M.D.	Scarlet, Crimson.
Mus.B.	Pale Blue, White Fur.
Mus.D.	White, Rose.
Ph.D.	Scarlet, Yellow.
M.Litt.	White lined with Blue.
Litt.D.	Scarlet and Mid-Blue.
B.Sc.	Dark Green, Black.
M.Sc.	White, Myrtle Green.
Sc.D.	Scarlet, Myrtle Green.
B.Dent.Sc.	Myrtle Green, Black, Crimson.
M.Dent.Sc.	Myrtle Green, Pale Blue, Crimson.
M.V.B.	Black, Maroon, Olive Green.
M.V.M.	White lined with Maroon.
B.A.I.	Black, Green.
M.A.I.	White, Green.
B.Comm.	Black, Gold.
M.Comm.	White, Gold.
B.A.I. (Elec. et Mech.)	Black, Green, Orange.
Sc.B.(Tech.)	Dark Green lined with Black edged with Orange.
Agr.B.	Black lined with Brown.
Agr.M.	White lined with Brown.
Agr.(Forest.)B.	Black lined with Brown edged with Green.
Agr.(Forest.)M.	White lined with Brown edged with Green.

Note:—All hoods are made in the full shape, similar to London; the capes should be rounded. Bachelors' and Masters' hoods are generally of black corded silk lined with fur or silk mentioned above, whereas Doctors' hoods are of scarlet superfine cloth lined with the silk specified above. Exceptions are, for example :—

B.Dent.Sc.	Myrtle green silk lined with black watered silk and edged with crimson silk.
M.Dent.Sc.	Myrtle green silk lined with pale blue silk and edged with crimson silk.
Mus.B.	Pale blue silk partly lined and edged with white fur.
Mus.D.	Cream figured damask silk lined with rose-coloured satin.

Durham

B.A.	Black and White Fur lining.
M.A.	Black and Palatinate.
B.D.	Black and Black.
D.D.	Scarlet and Palatinate.
B.C.L.	Purple and White Fur.
D.C.L.	Scarlet and White.
LL.M.	Maroon and Purple.
M.B., B.S.	Scarlet, Palatinate and White Fur edging.
M.S.	Rose and Purple.
D.Ch.	Scarlet, Rose and Purple.
M.D.	Scarlet, Scarlet and Palatinate.
B.Mus.	Palatinate and Brocaded Satin.
D.Mus.	Brocaded Satin and Palatinate.
Ph.D.	Scarlet, Scarlet and Palatinate Purple Silk edging 1".
B.Sc.	Palatinate, Fur and Scarlet Silk edging ¼".
M.Sc.	Black, Purple and Scarlet Silk edging ¼".
D.Sc.	Palatinate and Scarlet.
D.Litt.	Scarlet and Gold.
B.Hy.	Black, Purple, Scarlet and White Fur.
D.Hy.	Scarlet, Purple and White.
B.D.S.	Rose, Ivory and White Fur edging.
M.D.S.	Rose and Ivory.
B.Com.	Black and Cerise and White Fur edging.
M.Com.	Black and Cerise Silk lining.
B.Arch.	Black, Blue and White Fur edging.

and 2 Diplomas (*not* Degrees) :—

L.Th.
L.D.S.

Note:—Bachelors' and Masters' Hoods are generally intended to be of the Oxford M.A. type, but Doctors' hoods are of the Oxford Doctors' type with well-rounded capes.

Palatinate purple silk, cloth, or cassimere is peculiar to this University ; it is in fact a soft lilac shade.

Edinburgh

M.A.	Black and White.
B.D.	Black, Purple and Fur.
D.D.	Black and Purple.
B.L.	Black, Blue and Fur.
LL.B.	Black, Blue and Fur.
LL.D.	Black and Blue.
M.B., Ch.B.	Black, Crimson and Fur.
Ch.M.	Black and Gold.
M.D.	Black and Crimson.
B.Mus.	Scarlet, White and Fur.
D.Mus.	Scarlet and White.
Ph.D.	Black, Brown and Blue Shot.
B.Sc.	Black, Green and White Fur.
D.Sc.	Black and Green.
D.Litt.	Black, Blue and Yellow.
B.D.S.	Black, Crimson bordered with Ivory Fur.
M.D.S.	Black, Crimson bordered with Ivory Fur.
B.Com.	Black, Primrose Yellow, Fur.
B.Ed.	Black, Blue and Fur.

Note:—All hoods are of the simple shape and are worn back to front; all are lined with silk of the Faculty colour, Bachelors' being edged with white fur as well. Some of the Doctors' hoods (e.g. M.D.) have a sewn on cape of crimson silk as well.

Exeter

B.A.	Dove grey cloth edged with Faculty colour art. silk.
M.A.	Dove grey cloth lined with Faculty colour art. silk.
D.Litt.	Scarlet superfine cloth lined with dove grey cloth.
LL.B.	Dove grey cloth edged with Faculty colour art. silk.
LL.M.	Dove grey cloth lined with Faculty colour art. silk.
LL.D.	Scarlet superfine cloth lined with dove grey cloth.
B.Sc.	Dove grey cloth edged with Faculty colour art. silk.
M.Sc.	Dove grey cloth lined with Faculty colour art. silk.
D.Sc.	Scarlet superfine cloth lined with dove grey cloth.
B.A. (Social Studies).	Dove grey cloth edged with Faculty colour art silk.
M.A. (Social Studies).	Dove grey cloth lined with Faculty colour art. silk.
Ph.D. (all Faculties).	Dove grey cloth lined with scarlet cloth.

The Faculty colours are :—

Arts	Kingfisher blue.
Law	Purple.
Science	Turquoise blue.
Social Studies	Dark blue.

Note:—All bachelors have theological college style hoods, unlined, all the seams show, and the hood proper is merely edged with the Faculty colour 2" both inside and outside the cowl portion. All Doctors' hoods (incl. Ph.D.) are very heavy, being made of cloth and fully lined with cloth—no silk. All hoods are of the full shape similar to Cambridge. The Ph.D. hood is the Higher Doctors' hood inside out.

Glasgow

M.A.	Black and Purple.
B.D.	Black, Cherry, and Scarlet cloth border.
D.D.	Scarlet and White.
B.L.	Black and Red (Venetian red silk).
LL.B.	Black, Red, and Scarlet cloth border.
LL.D.	Scarlet and Red (Venetian red silk).
M.B., Ch.B.	Black and Scarlet silk lined with Scarlet cloth.
Ch.M.	Black silk lined with Scarlet silk.
M.D.	Scarlet cloth lined and faced with Scarlet silk.
B.Mus.	Black, Blue and Scarlet cloth border.
D.Mus.	Scarlet and Blue.
Ph.D.	Black and Crimson.
B.Sc.	Black, Gold and Scarlet cloth border.
D.Sc.	Scarlet and Gold.
B.Litt.	Black, White and Scarlet cloth border.
D.Litt.	Scarlet and Purple.
B.D.S.	Black, Green and Scarlet cloth border.
M.D.S.	Black and Green
B.V.M.S.	Black, Terra-cotta and Scarlet cloth border.
M.V.S.	Black and Terra-cotta.
D.V.M.	Scarlet and Terra-cotta.
Ed.B.	Black, Blue and Scarlet cloth border.

Note:—All hoods are of the full shape with well-rounded capes.

Hull

B.A. M.A. D.Litt. B.D. D.D. LL.B. LL.M. LL.D. B.Mus. D.Mus. B.Sc. M.Sc. D.Sc. Ph.D. (in all Faculties)	*All* hoods are lined throughout with the University silk, a turquoise blue taffeta. All Bachelors' hoods (other than B.D. and B.Mus.) are of black ribbed rayon, of the improved Oxford Burgon shape. The B.D. is of black superfine cloth of the same shape as the Doctors'. The B.Mus. is of the same shape as the B.A., LL.B. and B.Sc., but is of cream figured damask silk. The Ph.D. is of claret coloured cloth. The D.Mus is of the same shape as the Doctors' (*i.e.* of the improved Oxford Doctors' shape) but is of cream figured damask silk. All the Higher Doctors' hoods are of scarlet superfine cloth with semi-circular cape of the improved Oxford Doctors'. The necks of all hoods are cut in one piece with a single central seam and no neck bands are let in. Edging of all hoods is forbidden except that Masters' hoods are ordered to be edged ¼" with the lining silk (turquoise blue) round the cape portion only : all Masters' hoods are of the London shape, with well-rounded cape.

B.Com. M.Com.	Orange.

Note:—All London hoods are of identical shape (full shape with rounded cape). Bachelors' hoods are lined with Faculty colour 3″ only, Masters' are fully lined, Doctors' are all of scarlet superfine cloth fully lined with Faculty colour silk. Bachelors who are registered Members of Convocation are entitled to wear hoods of black corded ottoman silk, the remainder of the hood being fully lined with fine ribbed white silk. The B.Mus. hood is an exception and is of mid-blue corded silk with 3″ lining of white watered silk, but fully lined with white *watered* silk if a Member of Convocation. The Ph.D. hood is of claret coloured cloth fully lined with claret coloured silk, and *may* be edged with silk of the Faculty in which the degree was taken. Bachelors' hoods (except B.Mus.) and Masters' hoods are black, only Members of Convocation being allowed silk hoods.

M.Pharm.	Black, Light Blue and Grey.
M.Ed.	Light Blue and Lilac and Black.

Note:—All hoods in this University are of the full, Cambridge, shape. All Bachelors' hoods are of black stuff, lined for 3″ only with light blue silk. The hoods of all Masters and of Bachelors in Divinity are of black silk, and lined throughout with light blue silk.

The hoods of Doctors in Philosophy are of claret coloured silk or cloth lined throughout with light blue silk. The hoods of the Higher Doctors are of scarlet superfine cloth lined throughout with light blue silk.

All hoods in this University are bound (cowl portion only) with a ribbon of the appropriate faculty colour

The Faculty colours are :—

Arts	Cherry red.
Theology	Purple.
Law	Maroon.
Music	Pink.
Education	Lilac.
Science	Royal blue.
Pharmacy	Dove grey.
Agriculture and Horticulture	Green.
Engineering and Mining	Light Navy blue.

Oxford

B.A.	Black, half-lined and edged with white fur.
M.A.	Black silk, lined crimson or shot crimson silk.
B.D.	Black, lined fine ribbed black silk.
D.D.	Scarlet superfine cloth, lined fine ribbed black silk
B.C.L.	Medium blue silk, lined or trimmed with white fur.
D.C.L.	Scarlet superfine cloth, lined crimson silk.
B.M., B.Ch.	Medium blue, half-lined and edged with white fur.
M.Ch.	Black silk, lined and edged with blue silk.
D.M.	Scarlet superfine cloth, lined crimson silk.
B.Mus.	Lilac silk, half-lined and edged with white fur.
D.Mus.	Cream silk brocade, with apple-blossom embroidery, lined with cherry crimson silk.
D.Litt., D.Sc.	Scarlet superfine cloth, lined with grey silk.
B.Litt.	Light blue, half-lined and edged with white fur.
B.Sc.	Same as B.Litt.
B.Phil.	Dark blue silk, lined with white silk.

Note:—The Oxford Bachelors' hoods (except B.D. & B.Phil.) and the M.A. hood are either of Burgon or Oxford shape. The B.Phil. and M.Ch. hoods are always of Oxford shape. The B.D. and all Doctors' hoods are of the correct full apron shape. B.A., M.A., M.Ch., and B.D. hoods are of corded black silk; the other Bachelors' hoods are of corded or ribbed silk of the colour shown, lined or trimmed with white fur. When the Burgon shape is used the hood is half-lined and edged with fur, but for the Oxford shape only an edging of fur is used.

Reading

B.A.
M.A.
D.Litt.
B.Sc.
M.Sc.
D.Sc.
Ph.D.

All Reading hoods are lined with cream coloured silk. Bachelors' hoods are of dark blue lined with cream silk to a depth of 3″. All hoods are full shape. All Doctors' hoods are of scarlet superfine cloth fully lined with cream silk, of the full shape, except Ph.D., which is of crimson cloth lined with cream silk (maroon Russell-Cord is generally used).

St. Andrews

Ph.D. (in all Faculties)

All hoods are lined throughout with the University silk, a peacock blue. All Bachelors' hoods are of black ribbed rayon of the improved Oxford Burgon shape. The cowl portion only is edged inside and outside with ⅜″ of the Faculty colour, except in Law, in which case the lining is turned over ⅜″ on to the outside to form the edging, and B.A.(Law) which has an added edging of mid-cerise of ⅜″ on the outside of the cowl portion. All Masters' hoods are of the London shape, but with well rounded cape, the cowl portion is edged ⅜″ inside and outside with the Faculty colour except LL.M., in which case the lining silk is turned over ⅜″ on the outside to make the edging. The cape of Masters' hoods is edged ⅜″ with the peacock-blue lining silk. All Ph.D. hoods are of claret-coloured cloth fully lined with peacock-blue silk. All the Higher Doctors' hoods are of scarlet superfine cloth fully lined with peacock-blue silk. All Doctors' hoods (incl. Ph.D.) are of the improved Oxford D.D. shape. Neck bands are prohibited for all hoods, the neck of which must be cut on the curve in one piece with a single central seam.

Wales

B.A.	Black and Green shot Blue (3″).
M.A.	Black and Green shot Blue.
LL.B.	Black and Purple shot Red (3″).
LL.M.	Black silk lined with Red silk shot with Purple.

M.B., Ch.B.	Black and Black shot Green and White.
M.D.	Scarlet and Black shot Green and White.
B.Mus.	Blue and Pearl silk lining to a depth of 3″.
M.Mus.	Black silk fully lined with Pearl-coloured silk.
D.Mus.	Scarlet and Pearl.
B.Sc.	Black and Black shot Yellow.
M.Sc.	Black and Black shot Yellow (3″).
D.Sc.	Scarlet and Black shot Yellow.
Ph.D.	Crimson and Faculty colour.
D.Litt.	Scarlet and Green shot Blue.

Note:—Bachelors' hoods are of the simple shape, Masters' and Doctors' hoods are of the full shape.

USEFUL FACTORS

$(a+b)^2=a^2+2ab+b^2$
$(a-b)^2=a^2-2ab+b^2$
$a^2-b^2=(a+b)(a-b)$
$a^3+b^3=(a+b)(a^2-ab+b^2)$
$a^3-b^3=(a-b)(a^2+ab+b^2)$
$x^4+x^2y^2+y^4=(x^2+xy+y^2)(x^2-xy+y^2)$
$a^3+b^3+c^3-3abc=(a+b+c)(a^2+b^2+c^2-ab-bc-ca)$
$a^2(b-c)+b^2(c-a)+c^2(a-b)=-(a-b)(b-c)(c-a)$
$bc(b-c)+ca(c-a)+ab(a-b)=-(a-b)(b-c)(c-a)$
$a(b^2-c^2)+b(c^2-a^2)+c(a^2-b^2)=(a-b)(b-c)(c-a)$

ARITHMETICAL PROGRESSION

Last term $= a + (n-1)d$

Sum to n terms $= \frac{n}{2}[2a + (n-1)d]$

GEOMETRICAL PROGRESSION

pth term $= ar^{p-1}$

Sum to n terms $= a\frac{r^n - 1}{r-1}$ or $a\frac{1-r^n}{1-r}$

Sum to infinity when $r < 1$ $= \frac{a}{1-r}$

PERMUTATIONS AND COMBINATIONS

$${}^nP_r=n(n-1)(n-2)\,.\,.\,.\,.\,.\,.\,.\,(n-r+1)=\frac{\lfloor n}{\lfloor n-r}$$

$${}^nC_r=\frac{n(n-1)(n-2)\,.\,.\,.\,.\,.\,(n-r+1)}{\lfloor r}=\frac{\lfloor n}{\lfloor r\ \lfloor n-r}$$

BINOMIAL THEOREM

$$(a+x)^n = a^n + na^{n-1}x + \frac{n(n-1)}{1\,.\,2}a^{n-2}x^2 + \ldots + {}^nC_r a^{n-r}x^r + \ldots\ldots + x^n$$

MENSURATION FORMULÆ

LINES { Pythagorean Theorem $a^2 = b^2 + c^2$; Circumference of circle $= 2\pi r$

PLANE AREAS { Parallelogram $= bh$; Triangle $= \frac{1}{2}bh$; Trapezium $= \frac{1}{2}(a+b)h$; Circle $= \pi r^2$; Ellipse $= \pi ab$

CURVED SURFACES { Cylinder = circum. base × height. Cone $= \frac{1}{2}$ circum. base × slant. Conical Frustum $= \pi(R + r)s$; Sphere $= 4\pi r^2$

VOLUMES { Prism (or Cylinder) = area base × height; Pyramid (or Cone) $= \frac{1}{3}$ area base × height; Prismoid $= \frac{h}{6}(A + B + 4C)$; Sphere $= \frac{4}{3}\pi r^3$

TRIGONOMETRY

(a) $\pi = 3{\cdot}14159\ldots$ [approximations are $\frac{22}{7}$ and $\frac{355}{113}$

A Radian $= 57°\ 17'\ 44{\cdot}8''$ nearly.

(b) $\sin^2\theta + \cos^2\theta = 1$

(c)

Degrees	0°	30°	45°	60°	90°
Radians	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$
Sine	0	$\frac{1}{2}$	$\frac{1}{\sqrt{2}}$	$\frac{\sqrt{3}}{2}$	1
Cosine	1	$\frac{\sqrt{3}}{2}$	$\frac{1}{\sqrt{2}}$	$\frac{1}{2}$	0
Tangent	0	$\frac{1}{\sqrt{3}}$	1	$\sqrt{3}$	∞

(d) $\sin(-\theta) = -\sin\theta$; $\cos(-\theta) = \cos\theta$
$\sin(90° - \theta) = \cos\theta$; $\cos(90° - \theta) = \sin\theta$
$\sin(90° + \theta) = \cos\theta$; $\cos(90° + \theta) = -\sin\theta$
$\sin(180° - \theta) = \sin\theta$; $\cos(180° - \theta) = -\cos\theta$
$\sin(180° + \theta) = -\sin\theta$; $\cos(180° + \theta) = -\cos\theta$

(e) If $\sin\theta = \sin\alpha$, then $\theta = n\pi + (-1)^n\alpha$
If $\cos\theta = \cos\alpha$, then $\theta = 2n\pi \pm \alpha$
If $\tan\theta = \tan\alpha$, then $\theta = n\pi + \alpha$

(f) $\sin(A+B) = \sin A\cos B + \cos A\sin B$
$\cos(A+B) = \cos A\cos B - \sin A\sin B$
$\sin(A-B) = \sin A\cos B - \cos A\sin B$
$\cos(A-B) = \cos A\cos B + \sin A\sin B$

$\sin C + \sin D = 2\sin\frac{C+D}{2}\cos\frac{C-D}{2}$

$\sin C - \sin D = 2\cos\frac{C+D}{2}\sin\frac{C-D}{2}$

$\cos C + \cos D = 2\cos\frac{C+D}{2}\cos\frac{C-D}{2}$

$\cos D - \cos C = 2\sin\frac{C+D}{2}\sin\frac{C-D}{2}$

$2\sin A\cos B = \sin(A+B) + \sin(A-B)$
$2\cos A\sin B = \sin(A+B) - \sin(A-B)$
$2\cos A\cos B = \cos(A+B) + \cos(A-B)$
$2\sin A\sin B = \cos(A-B) - \cos(A+B)$

$\tan(A+B) = \frac{\tan A + \tan B}{1 - \tan A\tan B}$

$\tan(A-B) = \frac{\tan A - \tan B}{1 + \tan A\tan B}$

$\sin 2A = 2\sin A\cos A$
$\cos 2A = \cos^2 A - \sin^2 A = 1 - 2\sin^2 A = 2\cos^2 A - 1$

$\sin 2A = \frac{2\tan A}{1+\tan^2 A}$; $\cos 2A = \frac{1-\tan^2 A}{1+\tan^2 A}$

$\tan 2A = \frac{2\tan A}{1-\tan^2 A}$

$\sin 3A = 3\sin A - 4\sin^3 A$
$\cos 3A = 4\cos^3 A - 3\cos A$

$\tan 3A = \frac{3\tan A - \tan^3 A}{1 - 3\tan^2 A}$

$\sin\frac{A}{2} = \pm\sqrt{\frac{1-\cos A}{2}}$; $\cos\frac{A}{2} = \pm\sqrt{\frac{1+\cos A}{2}}$

$2\sin\frac{A}{2} = \pm\sqrt{1+\sin A} \pm \sqrt{1-\sin A}$

$2\cos\frac{A}{2} = \pm\sqrt{1+\sin A} \pm \sqrt{1-\sin A}$

(g) $\log_a mn = \log_a m + \log_a n$

$\log\frac{m}{n} = \log_a m - \log_a n$

$\log_a m^n = n\log_a m$
$\log_a m = \log_b m \times \log_a b$

(h) $\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$ $\quad \cos A = \frac{b^2+c^2-a^2}{2bc}\ldots$

				horse-power	$1{\cdot}77 \times 10^4$

CHEMICAL NAMES OF COMMON SUBSTANCES

Alcohol = Ethyl Alcohol (C_2H_5OH).
Alum = Potassium Aluminium Sulphate ($K_2SO_4.Al_2(SO_4)_3.24H_2O$).
Aqua fortis = Nitric Acid (HNO_3).
Bi-Carbonate of Soda = Sodium Hydrogen Carbonate ($NaHCO_3$).
Blue Vitriol (Blue Stone) = Copper Sulphate ($CuSO_4.5H_2O$).
Boracic Acid = Boric Acid (H_3BO_3).
Borax = Sodium Borate ($Na_2B_4O_7.10H_2O$).
Calomel = Mercurous Chloride (Hg_2Cl_2) (laxative, non-poisonous).
Chalk = Calcium Carbonate ($CaCO_3$).
Common Salt = Sodium Chloride (NaCl).
Corrosive Sublimate = Mercuric Chloride ($HgCl_2$) (violently poisonous).
Epsom Salts = Magnesium Sulphate ($MgSO_4.7H_2O$).
Fire Damp = Methane (CH_4) + air.
Glauber Salts = Sodium Sulphate ($Na_2SO_4.10H_2O$).
Green Vitriol = Ferrous Sulphate ($FeSO_4.7H_2O$).
Hypo = Sodium Thiosulphate ($Na_2S_2O_3.5H_2O$).
Lime = Calcium Oxide (CaO).
Oil of Vitriol = Sulphuric Acid (H_2SO_4).
Plaster of Paris = Calcium Sulphate $(CaSO_4)_2H_2O$.
Red Lead = Triplumbic Tetroxide (Pb_3O_4).
Sal Ammoniac = Ammonium Chloride (NH_4Cl).
Sal Volatile = Impure Ammonium Carbonate ($[NH_4]_2CO_3$).
Saltpetre = Potassium Nitrate (KNO_3).
Salts of Lemon = Potassium Hydrogen Oxalate (KHC_2O_4).
Spirit of Salt = Hydrochloric Acid (HCl).
Sugar of Lead = Lead Acetate ($Pb[C_2H_3O_2]_2.3H_2O$).
Verdigris = Basic Copper Acetate ($-Cu[C_2H_3O_2]_2.Cu[OH]_2$).
Vinegar = Dilute Acetic Acid ($C_2H_4O_2$).
Washing Soda = Crystalline Sodium Carbonate ($Na_2CO_3.10H_2O$).
White Lead = Basic Lead Carbonate ($2PbCO_3.Pb[OH]_2$).

* In the cases of these elements, which are very rare or not found in nature, but have been artificially prepared, atomic weight in the chemical sense is meaningless; the integral mass of the most stable isotope known is given.

† The validity of the evidence for the discovery of this element has been questioned.

Note: The new elements with an atomic number higher than that of uranium 238 are termed Transuranics.

GAS LAWS

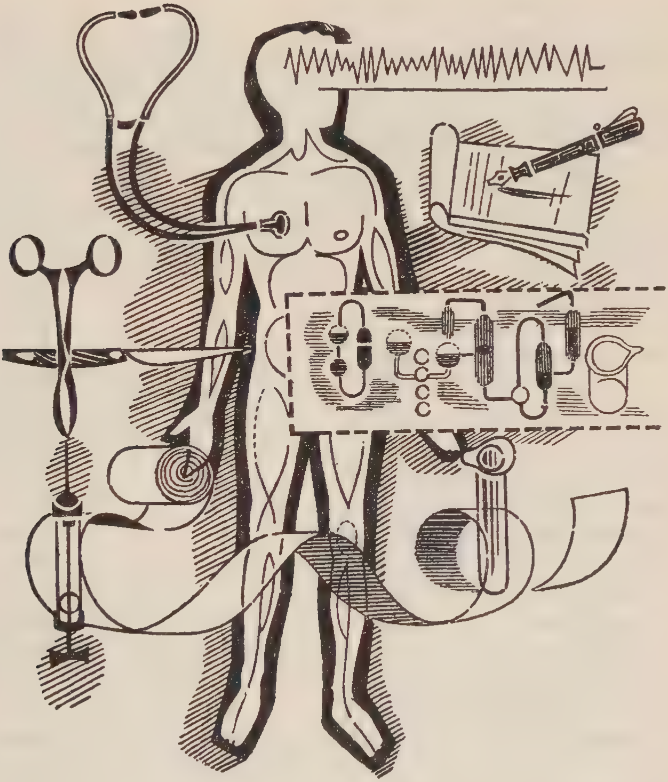
Boyle's Law (1662) pV = constant

Charles' Law (1787) $\frac{pV}{T}$ = constant.

Van der Waal's equation $\left(p+\frac{a}{V^2}\right)(V-b) = RT$ where a and b are constants.

Adiabatic expansion of a gas pV^{γ} = constant where $\gamma = \frac{C_p}{C_v}$.

Medical Matters



In recent times it has become apparent that people want to know more about medicine. The choice is thus not between knowing and not knowing but between accurate and inaccurate information. Here we attempt to give an objective account of recent developments, but not to usurp the function of the family doctor.

TABLE OF CONTENTS

Medical Matters

PART I. INTRODUCTION.

In past editions the Medical Section has taken the form of a dictionary which gave information on various medical subjects under separate headings arranged in alphabetical order. In this edition we are attempting something different: to make a sort of small medical text-book for the layman. There are two reasons for this. First, it was felt that some people might, out of general interest, want to get an overall picture of modern medicine and learn something about the progress going on in the field. Such people can read the section right through as a continuous narrative. More seriously, however, we began to feel that small snippets of information arranged in alphabetical order can be misleading. For example, if you look up "poliomyelitis" and find that it is a disease caused by a virus and controlled by a vaccine you will not be much the wiser unless you know what these words mean. So, too, if you believe yourself to have a stomach ulcer, it will not be of any help to look up "stomach ulcer" if, in fact, you have gastritis. With this new method, you will be able to look down a section dealing with diseases of the stomach to find which seems most likely to be the one which is troubling you. (Of course, unless your symptoms are slight, you would be very foolish to try to diagnose your own illness—that is a doctor's job—however, you *are* entitled to satisfy your curiosity!) But for those who preferred the old form arranged in alphabetical order there is an index at the end of the section, and all that is necessary is to look it up to find the reference. If that is how you prefer your information, you will have lost nothing by the way the section has been rewritten.

(a) HOW TO USE THE SECTION.

Diseases do not exist in watertight compartments, but doctors arrange them according either to their cause or the area of the body affected. This plan has been followed here, and at the beginning of each part an account of the group of diseases under discussion is given. Unless you know enough already, you would be wise to read it.

Here is some advice about your attitude to disease in general, and your use of this section in particular.

First of all, and obviously, no book is a substitute for the doctor, and when you are ill you must see him. There are good and bad doctors, competent and incompetent ones, just as in any other profession or trade; so choose a doctor you can trust, *and then believe what he tells you and carry out his advice.* There is no use complaining about the whole medical profession just because you are dissatisfied with your own G.P. If you are, you should change him.

Secondly, *never* believe what you hear from non-medical sources. Literally millions of people are made miserable every year by taking to heart nonsense told them by others, who may well be quite unaware of the harm they do, or even have the very best intentions. In any medical matter ask your doctor, and ignore your next-door neighbour's asked-for or unasked-for advice. Doctors are sometimes wrong, but they are much less likely to be wrong than someone without a medical education. Remember, too, that the statement that there is no cure for a disease does not necessarily mean that it is deadly; baldness, for example, if not curable, is hardly serious.

Thirdly, don't try to diagnose your own trouble or decide what treatment you think you should have. This section will have failed completely in its intentions if it puts you in the position of a character described by an English humourist, who, from a medical dictionary, discovered that he had every disease listed in it with the solitary exception of housemaid's knee. Diseases which appear to the layman to have the "same" symptoms may be vastly different in seriousness: influenza and poliomyelitis, for example, may, in the initial stages, appear very similar. So also may stomach ulcer and cancer of the stomach. No human being is infallible, but it is most important that you should go to the person who is best fitted to know—your doctor.

Lastly, you should not be misled into thinking that you can always tell the seriousness of a disease by the general appearance of the patient. Children, in particular, may have a high temperature, or even be delirious, on one day, and the next be out of bed and wanting to get back to school. On the other hand, many of the most dangerous fevers (as we shall see later) are accompanied by a low temperature and do not appear particularly dramatic in the initial stages. Thus a young woman who may be aware of nothing wrong but lack of energy and getting easily tired may be dangerously ill with tuberculosis of the lungs.

The best rule is to seek medical advice either when you have suddenly become ill with symptoms you don't understand or (and this is equally important) if you have gradually been feeling less fit over a period of time. Perhaps, too, it is wise to call your doctor if you have been ill with *anything* for more than three days. You should *not* call in a specialist before seeing your G.P., as is so often done in America and on the Continent. Specialists are very clever, but are naturally prejudiced in favour of their own subject; for example, an eye specialist will be predisposed to think of your headache in terms of eyestrain, an ear, nose, and throat specialist in terms of sinus trouble, and a psychiatrist in terms of mother-in-law trouble. Therefore you should first have a check from your G.P., who knows a little of all these things and probably a great deal about you and your past history. He will then advise you about a specialist if necessary.

(b) NEW VIEWS ON MEDICINE.

(1) Body and Mind. In former times, or, at least during the nineteenth century, the body was regarded as a sort of machine belonging to you in much the same way that you own your watch. You went to your doctor and, in effect, said: "Now what on earth are you going to do about my stomach?"—and you spoke as if, somehow, your stomach didn't have anything to do with the *real* you—it was just an awkward thing that happened to be annoying you. But we know now that this is not so—that your body *is* you, that it is a

fort fighting against such enemies as poisons, parasites, germs, cancer, injuries, things you are sensitive to (which we call allergens), and two others—not enough of the right kind of food, and anxiety. Your anxieties and worries can kill you just as surely as the other agents, and can prevent recovery or retard it when you are already ill.

A stomach ulcer therefore is not just something that is happening to you—you are happening to it. Your fears, your jealousies, your hatreds, your inability to get on in life, can be (in some cases) just as deadly as germs or poisons—in fact, they act by setting free glandular poisons in your blood-stream. Scientists have discovered a reaction which they call the "stress response," and we now know that stress can ultimately lead to sickness or death without any bodily injury at all. Thus, Dr. L. J. Saul, a leading American doctor, writes: "Emotional stress in which there is no physical damage can produce responses which lead to actual damage and even to death." Rats in the laboratory can be killed through long exposure to fear caused by loud noises or other forms of shock without even being touched.

This stress factor is emphasised not because it is more important than the other enemies of the body or mind (it would be better to say body-mind), but because, as we shall see later, it does cause serious diseases, and, secondly, as mentioned already, it influences the process of recovery. A person who is afraid or has no hope is less likely to recover from pneumonia or another disease than one who is hopeful, who has peace of mind and confidence.

(2) **New Views about Health.** A great deal of nonsense has been talked about the healthy life; at one time we were told to take eighteen chews to each bite, to do deep breathing, to take plenty of exercise, to get lots of fresh air, to eat regularly (or to indulge in peculiar diets). But more recently, eminent doctors have cast doubt on most of these fancies. Exercise is perfectly all right if you like it, but athletes who indulge in violent exercise have not always been noted for longevity. Fresh air is pleasant and stimulating, but, where actual breathing is concerned, it is no better than the air in most rooms. Certainly, one of the problems of our time is air pollution by smoke and Diesel fumes, which are highly dangerous, but at present we are considering ordinary fresh air in comparison with the air indoors, and, in this case, the experts say there is little difference so far as health is concerned.

A balanced diet containing correct amounts of the basic food substances is essential, but there is no evidence that when, or at what intervals, you eat makes the slightest difference—unless you are a sufferer from stomach ulcer, in which case it is necessary that the intervals between meals should not be too long. The whole business of having meals at fixed intervals is nothing but a social convention, and in modern life obviously a matter of convenience.

Sleep, too, is a necessity. But different people require vastly different amounts of sleep. Some manage on as little as three hours, others seem to believe that they need ten or more, and there are well-authenticated records of people who never sleep at all. For example, a certain Dr. Pavoni in Northern Italy did not sleep for sixty years and made a virtue of necessity by specialising in night calls! Insomnia is unpleasant, but its only harmful effect results not from sleeplessness itself but from worry about it; for many people seem to believe that if they do not sleep they will go mad or at least become seriously ill. This is quite untrue.

In a number of studies of men and women who lived to a ripe old age it was found that the only factors in common between them were that they had a good balanced diet of healthy food, that they had contented minds, and that they were interested in something which gave them an aim in life. They also came of long-lived families—for living a long and healthy life depends partly upon heredity.

So the main rules of health are: do not think too much about your health unless it gives you trouble; have an interest in life and be prepared to sacrifice a lot for it (nothing useful has ever been done by those who are always "taking care" and being over-cautious); eat a good balanced diet; do not worry, and have a contented mind.

(3) **New Drugs.** A great surgeon, the first of the moderns, was Ambroise Paré, who died in 1590, and one of his best known sayings was: "I apply the dressing, but God heals the wound." He was quite right; for until about forty years ago, or even less, all the physician could do was to put the patient in as favourable a state as possible to enable his body to cure itself. That is to say, there were hardly any specific drugs—drugs that had a direct effect on the disease. There was quinine, discovered by the Spaniards in America, which was specific for malaria, and there were iron (specific for anæmia) and digitalis (specific for certain types of heart disease), but otherwise nothing until the nineteenth century, when Paul Ehrlich discovered Salvarsan, which is specific for syphilis. Ehrlich died in 1914, having conceived the brilliant idea of drugs which he described as "magic bullets"—*i.e.*, drugs which, like bullets, would be aimed at the real cause of the disease. They would, that is to say, be specific.

Since then a large number of such drugs have been discovered. First, the antibiotics, such as penicillin, discovered in 1928 by Sir Alexander Fleming with the co-operation of Sir Howard Florey and Dr. E. Chain, who, in 1939, were able to make penicillin available to the public in sufficient quantities by new techniques of production. Penicillin is practically non-poisonous (although it is possible to become allergic to it, sometimes with serious results). It can kill some germs in a dilution of one part of penicillin to one hundred million parts of water; it is effective against streptococci, the cause of blood-poisoning, sepsis in wounds, and many other diseases; and also against the germs of anthrax, gonorrhœa, meningitis of some types, syphilis—a whole list of plagues which have troubled man for centuries. Blood-poisoning, whether from wounds or childbirth, used to be almost incurable—now the rate of cure is 80–90 per cent.; anthrax and gonorrhœa have an almost 100 per cent. rate of cure. In pneumonia the rate is about 90 per cent., and early syphilis can be cured in a week, instead of the previous two to three years.

But this was only the beginning. Other antibiotics—streptomycin, terramycin, erythromycin, and many others—are helping to wipe out the terrible scourges of the human race, in particular, in the case of streptomycin, tuberculosis. The sulpha group of drugs—sulphonamide, sulphaguanidine, sulphathiazol, etc.—have also proved a great boon. Secondly, there are the preparations from the endocrine glands which will be described later. Children who were doomed to the form of idiocy known as cretinism can now be transformed into normal happy individuals, and myxœdema, a similar condition developing in adult life in previously normal people, is also curable. Both diseases are due to lack of secretion from the thyroid gland, and this lack is replaced by tablets of thyroid extract. Similarly, sex hormones, male and female, are used successfully in women's diseases of the reproductory system, and, even more important, are now used in the treatment of breast cancer and, in men, cancer of the prostate gland. Cortisone, although not so valuable as preliminary reports suggested, is nevertheless capable of producing remarkable effects when used in the right type of case.

The antihistamine drugs are used in dealing with illnesses due to allergy (undue sensitiveness to substances harmless to normal people). They

help in some types of asthma, in hay fever, in some skin diseases, and from the antihistamine group there has been developed a remarkable new group of substances used in psychiatry—the so-called tranquillising drugs. In suitable cases the tranquillisers go to the root of the trouble in mental illness—anxiety, and, without making the patient sleepy, relieve his tension. Drugs in this group—known under the trade names of Largactil, Pacatal, Suavitil, and many others—have revolutionised the position in mental hospitals, and further advances are to be expected in the same direction.

Many other new drugs have been discovered, but they obviously cannot all be mentioned here —for example, there is coumarin, which, by reducing the power of blood to clot, helps in such serious heart diseases as coronary thrombosis, which is due to clotting of blood in the tiny blood-vessels which feed the heart muscle. But enough has been said to indicate the general trends, and more will be mentioned in what follows.

(4) New Methods in Surgery. Only a few years before the Second World War many surgeons were saying that surgery had reached its extreme limits. It was impossible, they believed, to improve on the delicate techniques then reached. But events have proved them wrong. Operations on the heart, for example, which would have been inconceivable a short time ago are now carried out daily—the heart can be opened and defects of the all-important valves made good. "Blue Babies" or adults with a heart disease which might have led to their death in a few years are now cured by surgery, and it is possible during such operations to cut off all the blood from the heart by deflecting it through tubes to an artificial heart outside the body—a machine which pumps the blood round the body whilst the real heart is at rest.

This however, will be described in more detail later.

Cancer of the œsophagus was formerly regarded as inoperable, but in a new operation the part of the œsophagus with the cancerous growth may be removed completely and replaced by a plastic tube.

Then there are the new anæsthetics, such as Pentothal, which are injected into a vein in the arm instead of being breathed in through a mask, as were ether and chloroform or ethyl chloride. Penthothal is much safer, and avoids the unpleasant after-effects of vomiting and nausea, which usually followed the old type of anæsthetic. Most curious of all, anæsthetists use the poison curare, used by South American Indians to poison their arrow-heads. Curare produces paralysis, but in small doses merely gives the degree of muscle relaxation which is so important to the surgeon when he is operating.

Lastly, we might mention the new techniques of plastic surgery. Thus large areas of skin which have been destroyed by severe burns can be replaced by shaving off thin layers from another part of the body. These do not need to cover completely the whole damaged area: small pieces are scattered over the wound and gradually grow together. Corneal disease (the cornea is part of the "window" of the eye, and when it becomes opaque the patient cannot see) is treated by removing the diseased cornea and replacing it by a cornea removed from a dead body, or sometimes from an eye which has had to be removed from a live patient for other reasons. There are, in fact, "cornea banks" where corneas are kept in refrigeration for future use, just as there are "blood banks" for use in blood transfusions. Other advances in surgery will be described elsewhere in the section.

(5) New Approaches in Social Medicine. Medicine has passed through many phases from the time when disease was regarded as a punishment from the gods or a sign of devil possession to the present era, when increasingly there is a tendency to look on society as the patient. Indeed, one commonly hears doctors and sociologists nowadays talking about "the sick society."

The early primitive stage came to an end—at least in one part of the world—when in Greece, five centuries before Christ, Hippocrates and others began to teach that all diseases were due to natural causes. But after the first ray of hope the outlook began to deteriorate when, during the Middle and Dark Ages (that is, from the fall of the Roman Empire right up to the fifteenth century), there was a return to the belief in devil possession and supernatural causes.

Eighteenth-century medicine in Europe was materialistic, regarding the body as a machine. It was founded upon a sort of pseudo-science—although, of course, there were always individual exceptions, physicians such as Sydenham in England, who, avoiding all theories, based their work on observation of the patient. This mechanistic approach persisted right through the nineteenth century, but medicine became more and more truly scientific, and the century saw the most rapid advances in the field ever known until our own times: the discovery of germs by Pasteur, of antiseptics to combat them by Lister, of vaccination by Jenner and anæsthetics by the American Wells and the Scot Simpson. The use of the microscope by Virchow, who was a German, brought great advances in the understanding of disease and Ehrlich, another German, conceived, as we have already seen, the idea of "magic bullets" which would attack the germs at the root of a disease without harming the patient. But one of the greatest of all these great men is perhaps the least known. His name was Edwin Chadwick.

From the earliest period of recorded history human communities had been constantly ravaged by great plagues which swept over their lands year after year, killing untold millions. Such plagues are recorded in the Bible and other ancient books, but, when town life became more and more common, as during the Roman Empire and the Middle Ages in Europe, the overcrowded conditions were even more favourable to the spread of disease. The Black Death of 1349 wiped out almost half the population of Europe. But, even in the first quarter of the nineteenth century in London, tens of thousands died from typhus, typhoid, and small-pox—and not only these, for periodically cholera would be brought into the country by travellers from abroad.

In the face of these terrible visitations the individual physician was helpless. He could not treat each one of the many sick even had he known how, and Chadwick's claim to fame rests on the fact that he was the first man to think in terms of *social* control of diseases, by so dealing with their causes that they were prevented from arising at all. In order to wipe out typhoid and cholera, he argued, we must ensure clean water supplies; for these diseases are caused by germs carried in polluted water. In order to attack typhus and plague, one must get rid of the lice which carry the germs of typhus and the rat-fleas which carry the germs of plague (including, of course, the rats, which, in turn, carry the fleas).

In the past, some attempts had been made to segregate the sick to prevent the spread of disease —for example, in the case of leprosy (which, strangely enough, we now know to be less infectious than most germ-borne diseases). But segregating those who are sick with typhoid or cholera is of little use if others are still drinking polluted water, just as it is of little use segregating plague cases if rats with their infected fleas are allowed to run at large. So these early attempts met with little success, due to lack of understanding of how the infections were passed on.

Chadwick was born in a Lancashire farmhouse where the children were washed every day all over, and he ruthlessly drove an obsession with

cleanliness into the heads of his countrymen until, later in the century, it was possible for the German philosopher Treitschke to tell his class in Berlin: "The English think soap is civilisation." Although this remark was meant cynically, there is little doubt that soap, if it is not civilisation in itself, has played a greater part in making civilisation possible than many more elaborate remedies. A population riddled with chronic infectious illness has neither the time nor the energy to apply to the arts or sciences, and soap did a great deal to reduce infection.

One of the first Public Health measures was introduced by Chadwick and others when they brought in legislation to purify the water supply of London. Previously, the citizens had used water from the Thames (they still do, but only after it has been filtered and sterilised at the waterworks!), and from filthy, refuse-laden ponds and springs.

Later, Chadwick helped to found the Poor Law Commission, and produced a Report in 1842, the principal suggestions of which were: a municipal water supply for all towns; scientific drainage both in town and country; and an independent health service with large powers for dealing with those who endangered the lives of others by polluting water or causing nuisances. He also proposed a national service for interment of the dead; for in those days bodies often remained for days in the overcrowded homes of the poor without burial.

What has the twentieth century contributed to the concept of social health? Well, of course, there has been a great deal of legislation along the lines initiated by Chadwick to control disease, and a great many other measures have been introduced concerned with the idea of positive health—not merely preventing bad health, but trying to bring about the highest possible state of good health. Orange juice, milk, and good meals for schoolchildren have brought about a transformation in child health which has become apparent to the least observant in the last ten or fifteen years. And the National Health Service (which is discussed elsewhere) is in the direct line of descent from early nineteenth-century legislation.

But in future years it is probable that the main achievement of the twentieth century in social medicine will prove to be its extension of the term "social health" to cover every aspect of community life, not only in such subjects as bodily health and its control by social means, but also such problems as mental illness, crime, delinquency, drug addiction, and so on. What we are now asking ourselves is: how far are these problems produced by society itself, and if this is the case, how far can we go in preventing them by social means?

Crime, of course, is by definition "bad," but a policy which merely condemns and punishes the prisoner will never help us to discover what caused him to take to crime in the first place. The theory of "an eye for an eye and a tooth for a tooth"—that is, the theory of retribution—is inadequate; for what we are really concerned with is the function of all law: to reduce criminality. Any method which does not do this or does not do it adequately is a method we can ill afford.

If, for example, we find that crime (or mental illness or a high suicide rate) is significantly more frequent amongst refugees and displaced persons or members of minority groups, we no longer interpret this as showing that Poles, West Indians, or such immigrant groups as the Irish labourer are more wicked or more mentally unstable than ourselves. The reason is that, in a strange land, their old way of life, which previously controlled their behaviour, has broken down, and they have not as yet been able to absorb the new way in the country of their adoption. That this is so is our fault as much as theirs; for it is our duty, not only to give such people impersonal "justice," but also to help them to become assimilated. Yet only too often they are met by the man in the street with suspicion and hostility—an attitude which is likely, on their part, to arouse more hostility. They become "rebels without a cause."

Much the same is true of many of our own youth who were growing up during the War: their beliefs (religious and otherwise) have disintegrated; they are both jealous and contemptuous of the older generation: they are in a society whose values are changing so rapidly that the gulf between the outlook of old and young becomes ever greater. Hence the "Teddy boy," whose activities may be perfectly harmless, but are not always so. He, too, is a rebel, without any very clear idea against what he is rebelling.

Social medicine takes the view that these problems can never be dealt with solely by moralising and retribution, but only by dispassionately analysing their causes and dealing with them. In this century we have developed a social conscience. Not always, it is true, a very well-informed social conscience, but at least this is a good beginning. There are organisations for dealing scientifically with delinquency, for dealing with problem children, for spreading knowledge about cancer in order to show people that it can be successfully treated if taken in time. The organisation known as "Alcoholics Anonymous" has, on the whole, been more successful in treating alcoholics by social means than have any of the individual medical methods. Mental illness is also treated by group methods, which, together with the new drugs, have revolutionised the position in mental hospitals.

We can well say with John Donne, who died in 1691, that "no man is an island . . . every man's death diminisheth me; for I am involved in mankind." This is the attitude of twentieth-century social medicine.

Summary. Perhaps we can sum up our progress in the past hundred years more dramatically in terms of hard facts.

One hundred years ago, a surgical operation was never undertaken except under the gravest circumstances. There were no anæsthetics and no antiseptics, and the operation was carried out by a surgeon in a filthy tail-coat, stained with the congealed blood of countless operations (indeed the surgeons of that time took pride in the dirty condition of their coat as showing how much experience they had previously had). Germs and the part they play in producing disease were unknown, and Paul Ehrlich had not yet been born, so there were no "magic bullets" to attack syphilis, or sera for diphtheria and other diseases. The mentally ill were simply locked up with little treatment and subjected to such indignities as the strait-jacket and the padded cell; now they are given treatment which becomes more effective each year, the padded cell and strait-jacket have gone, and in the more progressive hospitals even the ward doors are not locked.

Only ten or twelve years ago you would very likely have died if you had developed pneumonia, "childbed fever" after the birth of a child, meningitis, dysentery, typhoid, or tuberculosis. With such infections as blood-poisoning you would have had practically no chance at all. Today, the sulpha drugs and the antibiotics have changed all that. Syphilis and gonorrhœa were lifelong tragedies both to the patient and his family, but now they, too, can be conquered.

The National Health Service has brought the possibility of good treatment equally to all, and other bodies—some of them privately run—deal with alcoholism and neurosis, with rehabilitation of the mentally and physically ill, with spastics, birth control, and marriage guidance. It is up to us to see that all these facilities are used to the full by all who need them.

PART II. DISEASES ARRANGED ACCORDING EITHER TO THEIR CAUSE OR THE AREA OF THE BODY AFFECTED.

THE INFECTIOUS DISEASES

INTRODUCTION.

INFECTIOUS diseases are those which are caused by an invasion of the body by organisms from outside (the word "organism" simply means other living things, and we are using this word because, as will be seen later, it is not only what are known as "germs" which can cause infection). We know, too, that what is generally typical about this group is: (*a*) that the disease can be passed on from one person to another, and (*b*) that it is usually accompanied by a raised temperature or fever. Now (*a*), of course, is always true, because the definition of an infectious disease is one that can be passed on to others, but (*b*) is not always true, because a few infections produce little or no temperature, and also because it is possible to have a raised temperature (again in only a few cases) without any infection. For example, certain types of brain injury, tumour, or hæmorrhage can produce a raised—or lowered—temperature, and so can the injection of some foreign substance such as milk into the muscles. This is known as "protein shock," and was at one time used in the treatment of certain illnesses. Finally, solutions of dead germs, such as the anti-typhoid vaccine given to protect troops during the War, may lead when injected to very high temperatures. But, by and large, we are entitled to suppose that the patient with a raised temperature is probably suffering from an infection.

Types of Infection.

As we have seen, it is not only germs which cause infections—so from now on we shall give germs their proper name of "bacteria." Here is a list of the chief offenders which are liable to attack our bodies: bacteria, spirochætes, viruses, fungi, amœbæ, parasites, and worms. Of these, bacteria and viruses are by far the most important, but let us look at them all more closely.

Bacteria are tiny living things which can be seen only under a fairly powerful microscope. Some are like clusters of grapes (staphylococci), others are like rods which may be linked together in chains (streptococci). They are given these names because "staphylos" is the Greek word for a bunch of grapes, and "streptos" means a chain. Yet others are comma-shaped (such as the cholera vibrio), or shaped like a drumstick—a rod with a small knob at the end (the tetanus bacillus, which causes lockjaw).

It would be a mistake to think that all bacteria are harmful; for without some species we could not survive for long. Bacteriologists divide them according to their behaviour in the human body into three groups: saprophytic, parasitic or pathogenic, and symbiotic. The *saprophytic* organisms are the bacteria normally found in the skin, mouth, and intestines; they do us neither harm nor good. The *parasitic*, or as they are more usually called, pathogenic (*i.e.*, disease-producing) organisms, are the harmful ones with which we are naturally more concerned. Lastly, there are the *symbiotic* organisms, which, whilst taking something from the body, give something in return. For example, cattle would not be able to digest the cellulose of the grass they eat were it not for helpful bacteria in the lower parts of the intestines, and there are certain bacteria in the large intestine of man which build up vitamin B2.

Bacteria have two peculiar characteristics: each reproduces by splitting into two separate individuals, a process which, incidentally, happens every hour or so, and it has been calculated that if no bacterium were destroyed, one individual could produce a mass of bacteria larger than the whole world in a matter of a few weeks (since each of the offspring also divides into two, which in turn divide again—the progression goes: one gives birth to two, these two to four, the four to eight, eight to sixteen, sixteen to thirty-two, and so on—you will see, if you work it out, that in a short period the figure becomes astronomical). Fortunately, many bacteria have accidents, so for the present the world is safe! The other curious thing about bacteria is that, barring accidents, they are potentially immortal. Under ideal conditions in which no bacteria were killed, none would die; for a bacterium there is no death from old age, no corpse except when it is actively destroyed. It simply goes on dividing, dividing, and subdividing for ever.

How, then, are bacteria destroyed? Briefly, the answer is that most are destroyed by the natural defences of the body of whatever host they are preying on; others are destroyed by antiseptics and the new drugs; and many are destroyed when they are excreted from the body in the sputum or through the bowels and land in places where they are dried up and cannot survive —although some bacteria in such circumstances can form what are called "spores," rather like the seed of plants, so making it possible for them to survive in a state of suspended animation for months on end until picked up accidentally by another unfortunate host. Finally, bacteria, in addition to all these possibilities, face another danger: they may themselves develop disease. This disease is caused by even more minute organisms known as bacteriophages (viruses which affect bacteria), discovered by the French bacteriologist d'Hérelle a good many years ago. Attack by bacteriophage causes whole groups of bacteria (known as "colonies") to disintegrate and become harmless.

Although bacteriophage has been used in the treatment of some diseases in human beings, this method has now been largely given up, since the new drugs are infinitely more effective.

Spirochaetes. Spirochætes, like bacteria, are minute organisms, but differ in being shaped somewhat like a corkscrew and in being able to move (which many bacteria cannot do). Their progress is produced by a sideways wriggling motion. The two main diseases caused by spirochætes are syphilis and spirochætal jaundice. Spirochætal jaundice is carried by rats, and is common in those who work in mines. It is now rare in Britain, but still occurs in Japan, Egypt, and Malaya; the infection is passed through the skin where the excreta of infected rats mingles with water on damp ground in the mine where miners kneel. Infection may also occur through eating infected food.

Viruses. Unlike bacteria, viruses are too small to be seen under an ordinary microscope. They can, however, be photographed in some cases under an electron microscope, which uses a magnetic field instead of a glass lens and a stream of electrons in place of a beam of light. Viruses cause such diseases as typhus, measles, mumps, poliomyelitis, smallpox, and chickenpox—not to mention such plant and animal diseases as tobacco mosaic disease and foot-and-mouth disease, which often have serious economic consequences. Other virus diseases are psittacosis (an infection of parrots and similar birds which can be transmitted to Man), swine fever in pigs, influenza in Man, and myxomatosis in rabbits. They also cause, it is believed, the common cold.

The main characteristics of viruses are, first, that they can only grow in living cells—unlike bacteria, which readily grow in the laboratory on plates containing a jelly made from meat broth, gelatin, milk, and other delicacies. The scientist, therefore, must keep them in portions of living tissue kept alive outside the body. Secondly, they are so small that they pass through the pores of the finest filter. Thirdly, a first attack usually produces immunity for life. Second attacks of the common virus diseases mentioned above are very rare; but, unfortunately, this rule does not apply to influenza or the common cold. Fourthly, there is reason to believe that viruses represent an extraordinary intermediate stage between the living and non-living; they can, for instance, be produced in crystalline form and yet are just as dangerous when "thawed out." Lastly, the virus diseases have proved for the most part to be

little affected by the new antibiotics and other drugs, although vaccination in smallpox and the injection of sera from infected patients in other infections may give immunity for longer or shorter periods.

Viruses are also responsible for typhus, yellow fever, sand-fly fever—familiar to troops in the Middle East during the last War—and dengue fever. All of these are tropical diseases, although typhus used to be common in England just over a hundred years ago. In this country virus pneumonia and virus hepatitis (a liver disease accompanied by jaundice) are not uncommon, although little known to the average layman.

Fungi. Some infections are caused by fungi—that is to say organisms belonging to the same group as moulds, mushrooms, and toadstools. Penicillin and some other antibiotics are produced from moulds, so, as in the case of bacteria, some fungi are helpful; they even help to destroy each other, for actinomycosis, the most serious of fungal diseases, which can cause infection of the jaw, the large intestine, and even the lungs, is destroyed by penicillin injections.

Most fungal infections are trivial and limited to the skin. But, although trivial, they can be unsightly and uncomfortable. Ringworm of the scalp, dhobie itch—an infection of the groin spread by infected underclothing—and so-called "athlete's foot" are caused by a fungus.

Amœbae. Amœbæ are tiny, formless jelly-like masses, the largest of which (a harmless type found in stagnant ponds in Britain and elsewhere) is just visible to the naked eye. It is about the size of the head of a pin. Amœbæ move, in the species which are capable of moving, by pushing forward a part of the "jelly" in the appropriate direction and causing the rest to flow into the advancing portion. Like bacteria, they reproduce by dividing into halves, each of which becomes a new amœba.

The main human diseases caused by amœbæ are: amœbic dysentery (not to be confused with bacillary dysentery), sleeping sickness or trypanosomiasis, which is caused by a special kind of amœba known as a trypanosome, and malaria. All these will be discussed later in more detail, and all that need be said here is that these diseases, terrible though they once were, are well on the way to being controlled. We know, in fact, *what* to do in prevention and cure, and only human ignorance and lack of money (which is so freely spent on destructive ends) prevent them being wiped out altogether.

Parasites. These are small insects which live on the skin. The main ones in this country are lice, fleas, and the parasites of scabies. In themselves they are not dangerous, but some can carry the germs of very dangerous conditions: the flea, plague; the louse, typhus; and another, the mosquito, malaria and yellow fever.

Worms. Worms live in the human intestine, but the only common types found in Britain are threadworms, the tiny thread-like worms which cause irritability and itching in the skin of children, less often in adults; round-worms, somewhat resembling the ordinary garden earthworm, which seldom lead to symptoms; and tapeworms, which may reach a length of 10 or even 20 ft. Many parasitic worms (like some human beings) lead a double life—they spend part of their life in the human intestine and the other part in the muscles of another animal. The tapeworm, for example, whilst in the human intestine, lays eggs which pass out of the body in the excreta, and are then swallowed by pigs, especially in those parts of the world where human excreta are used as manure in the fields. In the pig, the eggs form cysts in the muscles—meat infected in this way is known as "measly pork"—and when, in turn, the meat is eaten by Man, the process in the intestine begins all over again.

Less common types, from our point of view, are the Russian tape-worm (which, as befits a Russian, grows to nearly 30 ft.!); this type is spread by caviare or undercooked infected fish. The small, leaf-shaped liver fluke, lays eggs which are passed into canals or pools in tropical countries in the urine of infected people, hatch out and enter a water snail, and finally leave the snail in the form of small parasites which pierce the skin of bathers, whence they pass to the liver and subsequently the bladder and rectum. This is a serious condition, as is also filariasis (another tropical disease), for which, unlike bilharzia—caused by the liver fluke—no cure is known. The tropical disease known as loa-loa is caused by a variety of filaria.

How the Infection is Spread.

Infection is spread in many ways, some of which have already been mentioned. In the common fevers found in Europe and elsewhere one of the most frequent ways is by *droplet infection*—that is to say, by minute drops carrying the germs which are coughed or sneezed into the air by someone already suffering from the disease. Such droplets can be projected into the air for 10 ft. or more, and when breathed in by someone within range infection may result. Next commonest mode of spread is perhaps by *infected food, water,* and the dirty hands of those who prepare food: cholera, dysentery, food-poisoning, and typhoid are spread in this way. Spread by *direct contact* is found in the venereal diseases (usually, but not always, spread by sexual intercourse with someone who already has the disease), and, of course, lice, fleas, and other parasites, including the scabies mite, are spread by contact with the infested individual—or sometimes with his clothes or bed linen. Spread through an *intermediary host,* whether it be lice, fleas, or mosquitoes carrying infection, or the various means adopted by worms, has already been described above, so no more need be said. Lastly, the infection may result from *bacteria already within the body*; for example, the bacillus coli which lives in the large intestine is there harmless, but if it gets into the bladder or the ureters (the tubes leading from kidney to bladder) a quite unpleasant result may follow in the form of cystitis or pyelitis.

How the Body Deals with Infection.

The body has many mechanisms of defence against intruders, but suffice it to say here that there are two main ones. First, substances known as antibodies and antitoxins are produced in the blood—the antitoxins to neutralise the poisons produced by the invaders, the antibodies to render them helpless, for example, by causing them to clump together so that they can more easily be dealt with by the second defence mechanism. This second mechanism is provided by the white cells in the blood, some of which (the phagocytes) act like amœbæ and swallow up and destroy the germs. Antibodies and antitoxins can be transferred from one individual to another and are used in medicine both to prevent infection and to cure it. This is known as immunisation, and can be active or passive. Active immunisation is produced by injecting either a solution of dead bacteria, as in the case of anti-typhoid injections, or by injecting live, but weakened, strains of the organism, as in the case of smallpox vaccination. In both cases the body is stimulated to produce its own immune substances. Passive immunisation is used either for people who have been in recent contact with infection or who are already ill, and in this case the antitoxins produced in another person who has had the illness are injected in the form of serum—*i.e.*, the liquid part of the blood without the blood cells. Active immunity may last a long time, but passive immunity is always short-lived.

Antiseptics.

We have already discussed the other ways in which bacteria are destroyed, and now need only make brief mention of antiseptics, and antibiotics. The earliest antiseptic was carbolic acid, used by Lister in his operating-theatre in the form of a fine spray directed throughout the operation on the wound, or sometimes in the form of steam from a kettle containing a solution of carbolic. But carbolic is dangerous, and since Lister's time many more useful antiseptics have been discovered. Acriflavine, thymol, and other old

favourites have been discarded too. The various forms of carbolic are still used to disinfect drains, but, to tell the truth, the use of antiseptics nowadays is very limited. In surgery the *antiseptic* method has given way to the *aseptic* method—instead of fighting sepsis we see to it that no possibility of sepsis is present before operating: all instruments, the surgeons' and nurses' hands, the skin, are sterilised—the instruments by boiling, the dressings by dry heat, the hands by soap and water, and almost the only antiseptic used is to clean the patient's skin in the area to be operated on.

Antiseptics are used as first-aid treatment for cuts and wounds, but should be applied only once as a general rule—that is, when the wound is first received. Even so, the modern doctor would probably prefer to use sulphonamide or penicillin powder.

Antiseptic sprays to purify the air of a room or to destroy germs lurking in the dust on the sick-room floor—or any other floor—are practically useless. To quote the *British Medical Journal*: "There is no good scientific evidence that any of the chemical air-disinfectants can control the spread of infection in places such as schools, offices, or cinemas. Nor is there good evidence that any substantial effect on the spread of illness can be obtained by disinfection of dust."

Neither is there any good reason to believe that mouth-washes and gargles have any effect other than making the mouth feel fresher and (temporarily) removing mouth odour—by covering it up with the scent of the antiseptic. Mouth-washes are in contact with the bacteria for far too short a time to have any damaging result, and, in the case of tonsillitis and other diseases, all the important bacteria are hidden far out of any danger from gargles.

Antibiotics.

The antibiotics—penicillin, streptomycin, erythromycin, terramycin, aureomycin, and chloramphenicol—have already been dealt with, and only two important practical points need to be mentioned. These are that although most of such drugs are entirely safe under ordinary conditions, it is extremely dangerous for the layman to use them without medical guidance. If, for example, people get into the undesirable habit of sucking penicillin lozenges for sore throat and keep on doing this every time the sore throat returns, they may become sensitised to penicillin so that, when they become really ill—say, with pneumonia—the serious illness no longer responds to the drug. Or the same habit may make them allergic or hypersensitive to penicillin, and an injection given later may have serious and even fatal results. In any case it is doubtful whether such lozenges have any effect.

Another possibility is that excessive use of antibiotics may kill not only the dangerous bacteria, but also the ones which are helpful to the body. When this happens, other types of organism which are not affected by antibiotics will multiply in the absence of the bacteria which normally keep them under control. Thus chloramphenicol or aureomycin, by killing useful germs in the large intestine, may cause vitamin B2 deficiency, and when the non-sensitive organisms have their natural enemies removed they may step in and multiply, causing inflammation of the mouth, diarrhœa, and occasionally a fatal bowel infection.

General Treatment of Fevers.

Fevers are ordinarily heralded in by a rise in temperature which is noticeable either by a flushed face or by alternate sensations of heat and cold. These are known as "rigors," and a patient with a high temperature may be shivering.

A high temperature does not necessarily (especially in a child) mean that the trouble is serious—in diphtheria, for example, the temperature is ordinarily rather low, whereas in relatively trivial conditions it is often fairly high.

Even the trained physician finds it difficult to tell one fever from another in the early days; for most of the common fevers begin in more or less the same way. It is only when a rash or some other more definite sign becomes evident that a certain diagnosis can be made, and these may not show themselves until the patient has been feeling "run-down" and fevered for some days. Incidentally, although a clinical thermometer is a very useful thing when properly used, many a doctor must feel that, in unskilled hands, it is a menace. The "fussy" type of mother who is constantly taking her child's temperature whenever it looks in the slightest degree different from usual (probably it is simply feeling justifiably bored with its parents), not only causes anxiety to herself but also gives the habit of anxiety to her child. The child is made to feel that the world is a dangerous place, full of germs and all sorts of causes for fear—as indeed it is, but one needs a sense of proportion, and other dangers which we think much less about are at least as frightening and twice as deadly as most germs. Whatever you do, don't get the thermometer habit; your child, so far as fevers are concerned, is a good deal tougher than you.

Briefly, then, the way to treat a fever in the early stages before the doctor comes, and before one knows exactly what is wrong, is as follows:

(1) Put the patient to bed.

(2) Give little, and easily digested, food; if the patient wants none, give none.

(3) Give plenty to drink—the proprietary preparations containing lemonade and glucose are excellent, but water, weak tea with sugar, or home-made lemonade with squeezed-out lemon juice and sugar, are also suitable.

(4) There is no good reason for giving aspirin, unless to relieve headache or other pains. Since believing this goes against the grain of long-established tradition, we quote from a leading text-book on drugs: "The use of aspirin is very limited because the reduction of temperature is rarely necessary." For very high temperatures, the patient may be packed with ice (this is mainly for heat-stroke), but the most effective way in the fevers ordinarily met in this country is to give the patient a hot bath or sponge him with hot water. This opens the pores and increases sweating. Aspirin is a good pain-reliever; it reduces temperatures—which, as we have seen, is rarely necessary; but it does *not* cure colds or help you to sleep (unless, of course, the sleeplessness is caused by pain). Proprietary drugs containing aspirin with codeine or phenacetin are no better than aspirin alone.

THE INFECTIOUS FEVERS.

The remarks made above apply to the management of *any* fever, and we are now going to discuss particular infectious diseases, beginning with the common childhood fevers, then passing on to less common ones, tropical diseases, and worm and parasitic infestations.

The common infectious fevers are caused by bacteria or viruses, and it is useful to know the meaning of the following terms: *incubation period* is the time which elapses between being infected and developing symptoms; *prodromal period* is the time which elapses between the end of the incubation period and the appearance of a rash; *quarantine period*, the maximum time during which a person who has been in contact with the infection may develop the disease—it is usually two days more than the incubation period; *isolation period*, the time a patient is supposed to be isolated.

Views regarding the common infectious fevers have changed a good deal in recent years. Disinfection of rooms is now regarded as almost useless, and more cases are treated at home. Quarantine in the case of the common fevers is thought by a good many doctors to be a waste of time, since all it can do is to postpone infection from early childhood to early adult life, when it is

likely to be more serious. For it is a characteristic of these fevers that they affect the adult much more violently than they do the child. However, on this, and all other points, you will have to be guided by the opinion of your family doctor.

Virus Diseases.

First, we shall take the common virus diseases, measles, chickenpox, and rubella or German measles, then the other virus diseases, mumps, infective hepatitis, virus pneumonia, and some less common conditions which do not always produce a typical rash as in the case of the first three.

In nearly all of these fevers there is a long incubation period, and one infection gives immunity for life.

Measles. The first sign is the appearance of symptoms rather like a severe cold. The eyes become red, and exposure to light is unpleasant, the nose runs, the throat becomes inflamed, and a dry, harsh cough develops. There may be headache, and the temperature rises to 102° or more. Usually the patient is a child between the ages of eight months and five years, and especially typical is the development of so-called Koplik's spots, which are small, bluish-white, raised spots seen on the inside of the cheek at the back of the mouth. The rash begins on the fourth day, and shows on the forehead and behind the ears, spreading within a day downwards over the whole body; in another two days it starts to disappear, but often leaves behind a sort of brownish staining which may last for one to two weeks.

Measles is not usually serious, but it can lead to complications, such as bronchopneumonia and infection of the ear, which are now preventable by the use of sulpha drugs or penicillin (although these drugs have no effect on the virus itself, but solely on the bacteria which have invaded the lungs and ear during the illness). The only other treatment is the use of cough medicine if cough is troublesome and aspirin for headaches. Quarantine period for contacts is three weeks; isolation period three weeks.

Rubella or German Measles. A mild fever, similar to measles except that the rash is usually the first sign that anything is wrong, and the temperature is rarely above 100°. The eyes may be pink, and there are enlarged glands at the back of the neck. The rash disappears completely in thirty-six hours. Quarantine period for contacts is twenty-one days; isolation period seven days from the appearance of the rash. There are no complications.

German measles, in itself, is harmless, but it has recently been discovered that if a woman gets the disease in the early months of pregnancy malformations in the child may appear at birth. Hence some doctors believe that children should have the opportunity of contracting German measles before they grow up. There is no special treatment, except the general rules for fevers given above.

Chickenpox. In children chickenpox is a mild fever which begins with the appearance of tiny blisters on the chest and back. These later spread outwards to the legs, arms, and face, and cause itching. Treatment is the general one for fevers already described. Calamine lotion or dusting powder will be helpful for the irritation, and the child's nails should be cut short to prevent scratching and infection of the spots. Quarantine three weeks; isolation, until last scab disappears. Whereas children are usually little bothered by chickenpox, young adults may be much more drastically affected—a temperature of 104° is not uncommon, and there may be severe headache.

Mumps. Everyone knows the typical appearance of the patient with mumps—the swelling in the salivary glands in front of the ears which makes the face look full. This causes pain later on, and it may be difficult to open the mouth. Temperature is not usually high (about 101°). Although uncomfortaole, mumps is rarely dangerous, but orchitis—swelling of the testicles—is sometimes a complication. Fluid diet should be given if eating is painful, with mouth-washes, and rest in bed. Quarantine, twenty-six days; isolation for a week after the swelling has gone.

Infective Hepatitis. "Hepatitis" means inflammation of the liver, and infective hepatitis, which is much the commonest cause of jaundice in young adults, is a virus infection of the liver. In fact, this disease caused serious difficulties during the Italian campaign of 1943, and has probably become more frequent (or, at any rate, more frequently recognised) in this country since the War. The main symptoms are fever, followed by jaundice, which is first noticed in the whites of the eyes as yellow staining, then in the skin. The urine becomes coloured also, and this is most easily noticed if, on shaking in a bottle, the froth shows coloration. If the froth remains white, no jaundice is present. Treatment is a matter for the doctor, but great care should be taken, both by the patient and those in contact with him, to wash the hands thoroughly after urinating or defæcating, after handling utensils from the sick-room, and both before and after eating; for the disease is very infectious.

Virus Pneumonia. Pneumonia is usually caused by bacteria, and when we speak of pneumonia, that is the type we ordinarily refer to. Virus pneumonia is known by doctors as "pneumonitis," and is believed to be closely related to influenza. There is no specific treatment so far, and since diagnosis is a specialist matter, little more need be said except that the symptoms in general resemble those of ordinary pneumonia. Psittacosis, another virus disease, can also lead to pneumonia, and although there is no specific treatment for virus infections of the lungs, it is always worth while trying the antibiotics or sulpha drugs in view of the possibility that the lung condition may be caused by a secondary invasion by bacteria.

Influenza. While serious epidemics of influenza take the form of a very dramatic and often fatal disease—for example, the epidemic of "Spanish 'flu" which followed the First World War killed more people than the actual fighting—the milder type more usually seen is difficult to distinguish from the common cold. In fact, many people who complain of "a dose of the 'flu" are suffering from simple colds.

However, a sudden onset, aching in the muscles of the back and legs, and redness of the eyes, would suggest influenza, and especially typical is the depression and weakness which follows influenza but not a cold. The measures suggested above for the general treatment of fever should be applied; but the depression and weakness which follows influenza can now be dramatically relieved in many cases by injections of "Parentrovite," a highly concentrated vitamin solution.

Colds. Although everyone thinks he, or she, knows what a "cold" is, the issue is not so simple; for the symptoms of fever, running nose, and a run-down, "headachy" feeling are found in many illnesses. They may be observed, as we have seen, in the early stages of measles before the arrival of the rash, or in a number of other fevers, such as whooping cough. Mild attacks of influenza (see above) may resemble the common cold, and blocking of the nose with discharge and fever may be due to sinusitis—although here there is usually pain above, between, or below the eyes. Lastly, similar symptoms result without any infection at all in allergic conditions, of which hay fever is a typical example.

A great deal of research has been done on the common cold, and it has been shown that genuine colds are a virus infection, that they have nothing to do with getting cold or damp in bad weather, and that some people get colds when exposed to infection, whereas others do not.

For all these conditions except the allergic type, the treatment is the same: bed, if the temperature is raised; two tablets of aspirin three times a day (nobody could stop you taking them, anyhow); a soothing cough mixture if there is any irritation of the throat causing soreness, hoarseness, or cough; and inhalations of menthol or Friar's Balsam—a few crystals of menthol or a teaspoonful of the balsam in a pint of boiling water—to clear the head. If desired, an inhaler, "Benze-

drex" or one of the other proprietary ones, may be used in place of the menthol or balsam.

Poliomyelitis. "Polio," or infantile paralysis as it used to be called, is a virus infection of the motor nerves—the nerves of movement—at the point where they leave the spinal cord. Fortunately, all the nerves are never affected, but only a few controlling one or more muscle groups. If these groups happen to be the ones controlling breathing or swallowing (which, fortunately, is not very common) the results may be serious, but ordinarily the muscles affected are those of the legs or arms. Poliomyelitis is most common in children under five years, but adults are also susceptible. Usually it occurs in small epidemics after hot weather, that is in Summer or Autumn, and it often seems to strike at fairly healthy normal people. This, however, is not because healthy people are specially prone as such, but because those living under less hygienic conditions are more likely to have developed immunity. In point of fact, the majority of cases of polio are so mild that they are never discovered at all, and paralysis does not develop; such people are specially dangerous, precisely because they pass unnoticed and spread the disease to others.

Like many other infections, polio begins with sore throat, fever, and sometimes vomiting five to ten days after contact. There may be severe headache and rigidity of the neck muscles. Paralysis is noted about the second or third day after this, and is usually at its maximum from the start, although this is not always the case. This stage lasts two or three weeks, by which time the temperature is down and the paralysis greatly improved, although further improvement may go on up to eighteen months after the acute stage.

Specific drugs are useless in this disease, but the new vaccine (a modification of the Salk vaccine is at present being used in Britain) promises to prevent infection in many cases. However, when the illness is already present attention is directed mainly to relief of discomfort, resting and splinting the affected limbs, and preventing spread of infection to others. The Kenny method, devised by Nurse Kenny, and much publicised as a means of reducing permanent paralysis, is not believed by most doctors to be any improvement upon orthodox methods. The use of the iron lung is restricted to cases where the muscles controlling breathing are attacked, and any permanent paralysis of the limbs can often be helped by surgical operation.

Encephalitis. This is an infection of the brain caused by a virus, first noted in Vienna in 1916. There was an epidemic in London in 1918, but it is not very common today.

Encephalitis begins with the same symptoms—headache, sore throat, and shivering—as most fevers, but the temperature is usually not much raised. This initial stage is followed by sleepiness (hence the name "sleepy sickness"—not to be confused with "sleeping sickness," a tropical disease found in Africa), weakness, delirium, and twitching of the muscles. There is often a curious expressionlessness in the face, known as Parkinsonism after the English physician who, in the early nineteenth century, described it as following certain diseases of the brain.

Encephalitis is a serious infection. Most unpleasant are its possible after-effects: Parkinsonism, which may persist and get progressively worse (see Paralysis Agitans), and what is known as Juvenile Pseudo-psychopathia. The latter is a very distressing condition in which children who have recovered from the physical effects of encephalitis later become delinquent: they are liable to show violence, lying, stealing, or become involved in sexual offences. Although they remain intelligent and know they are doing wrong, they are unable to control themselves. Of course, these after-effects do not occur in all cases. But the fact that criminal behaviour can be produced by physical disorders should be well noted by those who seem to suppose that almost everyone has complete control over his acts and that only the insane lack this control.

Smallpox. Smallpox was once common in Western Europe, and, as late as the early nineteenth century, was not unknown in Britain. Now, since the introduction of vaccination, it is comparatively rare in industrialised countries, although the occasional case turns up. Jenner, who introduced vaccination, noted that dairy-maids who had suffered from the mild disease known as "cow-pox," contracted from the udders of infected cows, and transmitted to the hand of the dairy-maid, did not develop smallpox. In fact, cow-pox is a mild form of smallpox modified by transmission through cattle. Vaccination should be carried out at the age of three months, and repeated at the ages of seven, fourteen, and twenty-one years—also at any time when an epidemic occurs.

Smallpox attacks people of all ages and is carried by excreta and droplet infection, but particularly by the dried scales on the skins of convalescent patients; it is now most common in the tropics.

The disease begins with shivering, headache, and backache, and the temperature is raised to 102–104°. On the third day a rash appears, which turns into small blisters on the sixth day, and the blisters become filled with pus by the ninth day. On the twelfth day they burst and form crusts. Unlike chickenpox, in which the rash starts in the middle of the body and works towards the outer parts, smallpox produces a rash which begins in the scalp, forehead, wrists, and feet and then moves towards the middle.

Smallpox is a serious disease, and the result depends largely upon whether the patient has been vaccinated within seven years of the attack. Contacts should be vaccinated and kept under observation for sixteen days; the patient must be isolated until all the scabs have separated and the skin healed.

Glandular Fever. The other name for this illness is the jaw-breaking one of "infective mononucleosis," so we had perhaps better keep to the more common one. Glandular fever is an acute infectious disease of children, probably—but not certainly—caused by an, as yet, undiscovered virus. It occurs in epidemics at schools, especially in Spring, and the main symptoms are a high fever with enlargement of the lymph glands, especially at the back and sides of the neck; there is also a sore throat. Usually the glandular swellings go down in about two to three days, but the patient may feel unwell and have a raised temperature for several weeks. The disease, however, is not dangerous.

Typhus. This disease used to be known as "jail fever," because it was frequent in prisons; but overcrowding, poverty, and bad hygienic surroundings anywhere are suitable conditions for epidemics of typhus. Improved conditions in industrialised countries have made it unusual, since typhus is caused by a virus carried from one person to another by lice, and where lice are absent the virus is helpless to enter the human body.

Typhus comes on suddenly with a rise in temperature of about 102°, but within four days it may be as high as 107°. There may, or may not, be a rash at this time, and in the second week, when the temperature is at its highest, there is delirium, weakness, and a feeble pulse. The typical typhus rash appears about the fifth day as reddish blotches on the chest, abdomen, and wrists.

Typhus is, needless to say, very serious and there is no specific treatment. In fact, most of the doctor's efforts must be directed towards preventing spread to others by destroying all lice with D.D.T.

Rabies. Finally, we shall deal very briefly with a number of less common virus diseases, beginning, as is appropriate, with *hydrophobia or rabies*, since it was in this infection that the great French scientist Louis Pasteur (1822—95) showed the possibility of prevention by vaccination. Unlike Jenner, with his ready-made cowpox virus, which we have seen to be the virus of smallpox weakened by natural passage through cows, Pasteur had to weaken the rabies virus by passing it through rabbits. The rabbits were infected, and after death the spinal cord was dried and powdered, a solution passed through another

rabbit, and so on until the virus was sufficiently weakened.

Rabies is spread by the bite of infected animals, usually dogs, cats, or wolves, who are driven mad by the disease; in Trinidad, however, it has been spread by vampire bats. Those who are bitten usually show no symptoms for six weeks or more, but sooner or later convulsions and delirium arise, which within four to five days are fatal.

There is no cure once the symptoms have developed, but Pasteur's serum, if given soon after the bite, prevents illness in the vast majority of cases—the sooner after the bite, the better the outlook. Dogs should be muzzled in areas where the disease is common, but quarantining imported dogs has made the infection almost unknown here.

Psittacosis. This is another virus disease which is of interest mainly in that it is spread by birds of the parrot group, such as parrots, love-birds, macaws, and the rest. It occasionally occurs here in people who have been in contact with birds of this type, and is serious both to the bird and its owner. As in the case of rabies, quarantine regulations have greatly reduced the likelihood of infection in Britain.

The symptoms of psittacosis are fever, cough, and bronchitis. The disease is especially dangerous to old people.

Sandfly Fever, or phlebotomus fever, *Dengue*, or breakbone fever, and *Trench Fever* are all somewhat similar conditions in that they resemble influenza and are rarely fatal. They are all due to viruses, spread in the first case by sandflies in tropical climates; in the second by mosquitoes in tropical climates; and in the third by lice in temperate climates. They are all typical "soldiers' diseases"; the first two were common in the Middle East and Far East during the last War, the third during the First World War in France.

Yellow Fever. Of all the virus diseases, only three can be prevented by vaccination—smallpox, hydrophobia, and yellow fever. Yellow fever is carried by a mosquito known as Stegomyia, common in South and Central America and in African ports. For its spread, it therefore needs: a hot climate, the stegomyia mosquito, and an infected person.

In 1898 the United States was at war with Spain in Central America, where yellow fever was a serious problem. Following this war the United States, by this time acutely aware of this terrible disease, asked a Dr. G. E. Waring to deal with it in Havana, where it was rife. But Waring died of yellow fever, as had many millions before him, without knowing its cause, and it was left to Water Reed, who died in 1902, to prove the connection between the mosquito and yellow fever. By a vigorous war on the mosquito, the disease is now almost non-existent in Havana, and Reed's discovery made possible the building of the Panama Canal (Ferdinand de Lesseps, the builder of the Suez Canal, had made a similar attempt in Panama, but had been beaten, amongst other factors, by yellow fever).

In yellow fever there is a sudden high temperature, aching of limbs and head, jaundice, and black vomit; the pulse-rate falls as the fever rises. Previous vaccination seems to be preventive if undertaken in time.

Conclusion.

All these virus diseases have this in common: that there is no specific cure, although smallpox, rabies, yellow fever, and poliomyelitis can be prevented by vaccination, or by the social control of the creatures carrying the virus (social control is effective in stopping other virus diseases, as we have seen). There is usually a long incubation period. Finally, it seems that a new serum, known as gamma globulin, can give protection lasting about two weeks against polio, measles, and German measles. Since the protection is very temporary, it is up to your doctor to consider whether the disease is serious enough to justify this protection or whether it is better to have the disease and ensure life-long protection.

Bacterial Diseases.

Bacterial diseases differ from virus infections in a number of respects: their incubation period tends to be shorter; having the disease once does not often confer lifelong protection; and unlike virus diseases, most bacterial diseases respond to the new sulpha drugs and antibiotics. In many cases it is possible to inoculate against the disease to prevent it occurring, as we have seen is possible with only a few of the virus diseases.

Scarlatina. This infection, usually known as scarlet fever, is found in connection with sore throats caused by a type of streptococcus. One attack usually, but not always, produces immunity, and most cases occur in children under twelve years old, rarely, however, in infancy. The incubation period is commonly three days, and begins with sore throat, fever, headache, and vomiting. The rash appears on the second day, first on the neck and chest, then over the rest of the body; it is in the form of a red background with bright red spots superimposed, and is most apparent in the arm-pits, on the front of the elbow-joints, the back of the knees, and in the groin. The face is flushed, and there is an area of pallor around the mouth. The throat is red, the tongue yellowish, but the yellow fur later gives way to a bright red "strawberry" appearance. By the end of a week the patient, under favourable conditions, begins to feel better, and convalescence begins with the third week. Complications are infections of the ear, kidney, and the heart.

Medical opinion has greatly changed in recent years as to the treatment of scarlatina: the old picture of fever hospital, disinfection, fumigation, and (as one authority puts it) "the baking of books and boiling of toys and clothes" has gone, and nowadays most cases are nursed at home with only simple precautions to prevent spread from throat to throat. Large doses of penicillin or some other antibiotic are given, and in this way the likelihood of complications is much reduced. Quarantine period: those contacts who react positively to the Dick test (a skin test which shows up those who are still susceptible to the disease and thus not immune) may be kept in quarantine for a week; isolation period for the patient is four weeks.

Diphtheria. This used to be an extremely serious disease, but immunisation has made it milder and much less common; it is important, therefore, that all children should be immunised, although it should not be thought that this gives absolute protection. Sometimes diphtheria vaccine and whooping-cough vaccine are combined, but there are those who disapprove of this procedure, so you should be guided by the opinion of your own G.P.

In a typical case of diphtheria the incubation period is about three days; the patient is a child who becomes ill and pale-looking (*i.e.*, the onset is not sudden, as in many fevers, but insidious); the temperature is only slightly raised to, perhaps, 99° or 101°, and although there may be no complaint of sore throat, examination will revea inflammation with—and this is typical of diphtheria—a grey membrane spread over the tonsils, the palate, and the back of the mouth generally. The diphtheria germ does not spread within the body. It stays at the place where it entered (in this case the throat) and sends its toxins throughout the body.

Even after the acute phase is over the patient must not be allowed to walk, because the diphtheria toxin is particularly poisonous to the heart. The ordinary rule is at least one or two months in bed. There is an anti-toxin which helps to get the patient over this stage, but the sensible thing to do is to have your child protected before infection occurs.

Diphtheria also occurs in the larynx—in pre-inoculation days many children choked to death with this form of the infection; in the nose; and, although this is not generally known, wounds can be infected. The so-called "Desert sores" of the North African campaign seem to have been caused by diphtheria-like organisms.

Diphtheria may lead to paralysis of the throat, with difficulty in speaking or swallowing, and paralysis of the eyes or limbs; these are due to

neuritis caused by the influence of the toxin on the nerves.

Whooping Cough. For many years whooping cough has been regarded merely as a bother to the patient and a nuisance to others, as, in fact, a trivial disease. Unfortunately, this is not so: because statistics show that it causes more deaths than polio, diphtheria, scarlet fever, and measles all put together.

Whooping cough begins in a child as an ordinary cold with cough and slight fever, and this stage lasts for a week or ten days. Then the "paroxysmal stage" begins as a series of coughs following in rapid succession, during which time the patient is unable to breathe. The "whoop" is caused by the noisy indrawing of breath when the fit stops. The face may become blue and congested. Bronchitis is usually present, and bronchopneumonia may result as a complication, so inoculation of all children before the disease has a chance to strike them is most important.

Once whooping cough has begun, there is no specific treatment, although modern drugs can reduce the frequency of the fits of coughing. The antibiotic chloramphenicol has been used for this disease, but the general opinion is that it is ordinarily of little benefit. Chinese physicians have described whooping cough as the "hundred-days cough," and the cough may, indeed, continue for at least a hundred days.

Food Poisoning Diseases.

Strictly speaking, there is no such thing as "food poisoning" if one is thinking of "poisoning" in terms of anything apart from germs. But not so long ago it used to be thought that decomposition of food in itself produced poisons known as "ptomaines" which were deadly to those who swallowed them. All food poisoning is caused by infection of food with bacteria and by no other cause—unless, of course, we are thinking of the kind of poisoning which is the concern of the lawyer rather than the medical man.

Here we are considering those diseases which are commonly spread by contaminated food or drink. The classification is not scientific, but then no scientific classification has as yet been devised. First, we shall deal with typhoid, paratyphoid, and dysentery—uncommon here in Britain, although Sonné dysentery is fairly frequent. Then there is gastro-enteritis (which means irritation of the stomach and intestines), which is caused by staphylococci and the germs of the salmonella group, and lastly, botulism, which is rare.

Typhoid and Paratyphoid. These diseases are spread by infected water, food, or hands—especially uncooked food, such as milk, salads, oysters, and shellfish. Flies, too, play some part in spreading the disease. Some people are "carriers" and carry and excrete the germs without being themselves affected; for example, "Typhoid Mary," a carrier in the United States in the early years of this century, spent a large part of her life in custody as a public danger, although she did not show any symptoms of typhoid. Nevertheless, this woman caused a great deal of illness in others in her chosen profession of cook.

The influence of Chadwick's propaganda for pure water supplies is shown by the fact that deaths from typhoid, still 332 per 1,000,000 in 1870, fell to 198 per 1,000,000 at the beginning of this century. In the 1920s the death-rate was only 25 per 1,000,000, and now it is even less.

Typhoid fever begins like most fevers with headache, raised temperature, and general feeling of unwellness. This stage lasts about a week, and then the rash appears in the form of rose-red spots on the front of the chest and abdomen and on the back. In the second week there is great weakness, sometimes diarrhœa, flatulence, and mental dullness, together with dry and cracked lips and tongue. The third week is the week, in hopeful cases, of gradual decrease in temperature and other symptoms, and the fourth week is the week of convalescence.

Complications are perforation of the intestine (which needs surgical treatment), delirium, and bronchitis.

Paratyphoid fever is a milder form of typhoid (there are two forms, A and B); ordinarily it can be diagnosed only by scientific tests. The main thing is to inoculate with T.A.B. vaccine and to protect food supplies; it is much easier to prevent typhoid than to cure it.

Dysentery. Dysentery may be caused *either* by a bacterium or an amœba; the first type is known as bacillary dysentery, the latter as amœbic dysentery (which is dealt with under tropical diseases). Infection is spread in much the same way as in typhoid. There is high fever, abdominal pain, and diarrhœa, at first consisting of fæcal matter, then blood and mucus. In severe cases the death-rate used to be over 20 per cent.

Various bacilli cause dysentery. The common tropical types are the Shiga and Flexner groups, but in this country most epidemics are due to the milder Sonné group.

However, in all these infections sulphaguanidine, one of the sulpha drugs, brings rapid relief, but care must be taken to avoid infection of other people.

Diarrhœa and Vomiting. Leaving out typhoid and paratyphoid fevers and dysentery, there is a group of infections known as "D. & V."—diarrhœa and vomiting. In Britain D. & V. is mostly due to:

(1) Salmonella infection.
(2) Staphylococcal infections.
(3) Other bacteria, ordinarily harmless, such as bacillus coli, when present in sufficient quantity.

Salmonella Infections are the most serious of this group; they affect the small intestine and produce vomiting, severe abdominal pain, and diarrhœa. These symptoms occur about one day after eating infected food and usually clear up within about two weeks, but occasionally death results. Salmonella bacteria are most likely to be found in meat, egg powder, vegetables, and ducks' eggs, but staphylococci are liable to grow in milk products, such as ice-cream and cream buns. Food poisoning from staphylococci is seldom severe, and recovery takes place in about a week. Nevertheless, it is extremely infectious, and causes a great deal of lost time in industry and temporary illness in institutions; for it is in such situations that it is most likely to occur.

Staphylococcal Food Poisoning has greatly increased in recent years, so it is important to know what circumstances are likely to cause it. The reason for its increase has nothing to do, as many people suppose, with the greater use of canned foods, but it has much to do with the greater use of communal feeding and canteen meals. It is *possible* for bacterial toxins in infected food to bring about illness even when the canning process has killed the bacteria, but it is certainly extremely rare. Canned foods, in fact, are much safer than so-called "fresh" foods in this respect—except when they have been opened, left about, and then re-heated. The same applies to the re-heating of any kind of food.

The real enemy is the canteen worker with a boil, a discharging nose, dirty hands, or a septic finger. Occasionally food may be infected in the larder by rats or mice, but the sort of canteen or restaurant where this can happen has little to commend it! Frankly, these infections are caused by dirty or stupid people who do not realise that their sore finger or boil can become someone else's diarrhœa and vomiting. Where children are concerned, the outlook is potentially more serious, and in the early part of this century the Summer-time "procession of baby coffins" was all too familiar. Infection is much more common in artificially fed babies or in older children who eat infected ice-cream. However trivial the condition may seem, diarrhœa and vomiting with fever in a child should never be ignored. Those in charge of canteens or restaurants must ensure that staff is supervised, that anyone with a septic infection is put off duty, and that all know about washing after visiting the lavatory and absolute cleanliness.

Bacilli normally present in the intestine, such

as bacillus coli, can cause infections if absorbed in large amounts, or if of a different strain from those in the patient's intestine. They are not usually serious.

Botulism. Now uncommon, this is the disease which used to be known as "ptomaine poisoning" on the theory that it was caused by poisons produced by bad food apart from germs. In the 1920s a party of picnickers at Loch Maree in the Scottish Highlands developed botulism and a number died, with the result that the disease attracted much public attention. Botulism is caused by a germ, the bacillus botulinus, which is peculiar in that, like tetanus, its poison attacks the nervous system rather than the intestines, resulting in fits, double vision, paralysis beginning in the face and spreading downwards, and difficulty in swallowing. It is found in tinned fruits or vegetables containing the toxin even when the germ has been killed, but, as we have already seen, the toxin comes from the bacilli, not from decomposition of food as such (in fact, food does not decompose in the absence of germs). Death is common in botulism, but an antitoxin is now available which, if used in time, can cure the disease.

Tuberculosis. No disease causes more public concern, and no disease is more difficult to describe, than tuberculosis; for, like the streptococcus or the staphylococcus, the tubercle germ can attack many different parts of the body and manifest itself in many ways. Furthermore, it is a widely spread disease, infecting not only humans but also cattle, birds, and reptiles. But here we shall be concerned with those types common to Man—the human and bovine (*i.e.*, the type occurring in cattle which can be spread to man by infected milk).

The tubercle bacillus is particularly hardy, so that when coughed or spat out on the ground it continues to be infectious for a long time. Infection is therefore caused by: (*a*) drinking infected milk; (*b*) droplet infection through having germs coughed in the face; (*c*) breathing in infected dust. In other words, tuberculosis is caused by absorption through either the lungs or the intestines; the former is common in adults, the latter in children.

But there is a good deal more to the problem than this; we know, for example, that over 90 per cent. of people in industrialised countries have been infected with T.B. in early life and have conquered the infection. So the question arises: what conditions predispose to T.B.—why do some people get over the early infection and others not? There are two answers to this question: one is certain—that those who are impoverished and do not get enough food are liable to T.B.; the second is not so certain—that mental stress plays some part. Yet there is reasonably good evidence that such stress as a broken love-affair can cause lowered resistance to breakdown so that when germs are encountered infection will occur.

In children, lung tuberculosis is not common, but tuberculosis of the bones and glands is, as is also infection in the abdomen, the kidney or spine, and, worst of all, tuberculous meningitis. These are often of the bovine type from infected milk. Ordinarily, T.B. in children is less serious than adult infections; but tuberculous meningitis used to be almost invariably fatal until streptomycin was discovered.

Adult tuberculosis usually occurs in the lungs or the pleura—the thin membrane surrounding the lungs. In younger people miliary tuberculosis, which is a form of T.B. blood-poisoning or septicæmia, is a very serious condition, and the infection spreads throughout the whole body in a few weeks.

Lung infection begins gradually in someone who has previously felt unwell. There may be cough, and later blood-stained sputum (although blood which is coughed up does not necessarily prove that T.B. is present). Whatever means of treatment are used, the struggle between disease and patient is likely to be fairly long, but the outlook is now good. However, there is little reason to suppose that fresh air or a sanatorium in Switzerland produces any better results than treatment at home.

Prevention depends on legal action ensuring tuberculosis-free herds of cattle; on control of spread of the disease by those "open" cases who carry germs in their sputum; on the use of vaccination in childhood with B.C.G. vaccine (which you can ask your doctor about).

Many methods are used in treatment; new drugs, such as steptomycin and P.A.S., lung surgery, rest, and so on. At any rate, tuberculosis is being got under control, but anyone who is worried can get a free X-ray at the nearest Mass Radiography Centre. For children, there are skin tests to show whether there is susceptibility to T.B.

Septicaemia. Commonly known as "blood-poisoning," is one of those diseases of which text-books prior to the Second World war used to say: "death usually occurs."

Blood-poisoning occurs generally by spread from some septic area such as a wound (or even a small prick), after childbirth, or any place where certain germs have got admission to the body. The most usual germ is the streptococcus, although the pneumococcus—which ordinarily causes pneumonia—and the staphylococcus may also cause septicæmia.

Fever comes on suddenly and rises rapidly with headaches, sweating, and shivering. The patient is obviously very ill, and later there is wasting and delirium. The white blood cells increase in number. Septicæmia sometimes occurs without any apparent local infection in those who are weak and debilitated.

Pyaemia is a type of septicæmia which leads to the formation of numerous abscesses throughout the body. Its symptoms are the same as described above, except that the causative germ is usually the staphylococcus, and abscesses are found which may need surgical treatment.

However, in both conditions the state of affairs has been revolutionised by the use of the sulpha drugs and antibiotics; cure is now the rule rather than the exception.

Septicæmia should be suspected when any small wound or cut is followed by high temperature and the symptoms described above.

The word "*Toxaemia*" is used when the germs stay in their original position and produce symptoms by spreading their toxins throughout the body. Tetanus, diphtheria, and some kinds of childbirth infection come into this category; the symptoms may vary from mild disturbance to severe illness.

Meningitis means inflammation of the meninges, the covering which, like a layer of plastic, lies over the brain and spinal cord, just as the pleura covers the lungs and the peritoneum covers internal organs in the abdomen. (Hence inflammation of the pleura is known as pleurisy, and inflammation of the peritoneum as peritonitis.)

Various germs may cause meningitis, for example, the bacillus of tuberculosis, the pneumococcus, which ordinarily causes pneumonia, and the streptococcus or staphylococcus, but ordinarily the word refers to *Cerebrospinal Meningitis* or "spotted fever" caused by the meningococcus and occurring at times as an epidemic. It is commonest in the years from infancy to the early twenties, and begins suddenly with headache, vomiting, and fever. The temperature rises quickly, and pain develops in the back and legs; on the second or third day a rash appears on the body, and particularly on the inside of the thighs. Later there is stiffness of the neck, the head may be drawn back, vomiting persists, and the headache can be so severe as to cause the patient to scream with pain.

Fortunately, this type of meningitis (and most of the others) respond to treatment with antibiotics or the sulpha drugs, so the risks are very much less than formerly.

Pneumococcal Meningitis is an unusual complication of pneumonia, and the septic types (*streptococcal or staphylococcal*) arise either following an infected fracture of the skull or from infection of the ear or mastoid.

Tuberculous Meningitis has already been mentioned; originally always fatal, it is now treatable with streptomycin.

All these diseases are very much a matter for

specialist and hospital treatment, but it is worth while mentioning *benign lymphocytic meningitis*, in which, although all the symptoms of meningitis are present, recovery without specific treatment is invariable. Meningitis, which was during the First World War and after what polio is to us now, is no longer common, and when taken in time is easily treated.

Tetanus is usually known as "lockjaw" because there may be difficulty in opening the mouth, although this is simply part of a spasm of all the muscles of the body. The tetanus bacillus is found in rich soil—hence the disease is less common in desert areas—and tetanus resembles rabies in that: (*a*) it enters at a wound; (*b*) it affects the nervous system; (*c*) it results in fits and ultimately death.

However, active immunisation with T.T. (tetanus toxoid) has resulted in the disease becoming uncommon, and even when developed, treatment with antitoxin, anæsthetics, and curare may lead to cure.

The bacillus is anærobic (*i.e.*, does not use oxygen) and is most likely to occur in such situations as when a man digging manure or working in his garden sticks a fork through his foot, or, in war-time, when he is wounded in soil contaminated with manure.

Undulant fever, also known as Malta fever or abortus fever, falls into two types: melitensis, which infects goats, and abortus, cattle and pigs. Man gets the disease by reason of close contact with or drinking the milk of infected animals. (The name abortus is given because abortion is produced in cattle and sows.)

In Undulant Fever, as one would suppose, the fever goes up and down for two to three weeks; it may then go down and rise again, persisting for many months. The disease may occur in Britain, but modern drugs are on the whole successful in dealing with it. A striking feature of the disease is the combination of a high temperature with an appearance of relative well-being.

Another disease carried by mammals is *Glanders* or *Farcy*, spread by horses. In glanders there is discharge from the nose and sometimes pneumonia. Occasionally the disease is fatal. In farcy abscesses form, usually along the lymph vessels. Both conditions are very contagious, and treatment is a matter for a specialist; infected horses should be destroyed.

Cholera. Cholera could be classified under the head of food-poisoning, because it is mainly spread by infected water (however, like typhoid, it can also be spread by flies, infected food, and carriers); it could also be classified as a tropical disease, since, although it used to be found in Europe, it is now mainly rife in India.

Also like typhoid, cholera is caused by a bacillus, and can be prevented by early innoculation and care over food supplies—boiling water and milk, washing uncooked foods in chlorinated water, and keeping flies away.

The fever begins in the usual way with a short incubation period, followed by abdominal pain, severe vomiting, and diarrhœa. Later with the loss of fluid from the body there may be cramps in the muscles, diarrhœa increases, and the motions become of the typical "rice-water" type —*i.e.*, there is no solid matter, and the appearance is that of water to which a little milk has been added. This stage is followed by collapse, with low pulse and cold hands and feet. Death, if adequate treatment is not available, results in about 70 per cent. of cases.

Anthrax. The bacillus of anthrax, like that of tuberculosis, can exist outside the body for long periods, and, like that of tetanus, then takes the form of spores or seed-like bodies. It is spread by infected cattle and horses, which get the disease from eating grass containing spores.

In human beings the form the disease takes depends on where the germ alights; sometimes it comes from infected shaving-brushes, when it causes a large sore, like a boil, on the face, known as "malignant pustule"; sometimes it develops on those who inhale the dust from infected hides or wool (hence the name "wool-sorters' disease," which is a form of bronchitis with blood-stained sputum); lastly, it may arise through eating infected meat, when the result is intestinal anthrax.

In all cases the outlook is serious. Death is common, preceded by a high temperature, skin symptoms in the first instance, lung symptoms in the second, and food-poisoning symptoms in the third. Serum and arsenical preparations were formerly used, but now the sulpha drugs seem to offer more promise.

Diseases Caused by Fungi.

There are only two important groups of disease caused by fungus: the serious *actinomycosis* and the relatively harmless, if unpleasant, *ringworm*. Ringworm or tinea will be dealt with later; it affects the hair, the body, the groin (dhobie itch, already referred to), and the feet (athlete's foot). Actinomycosis is spread by a fungus in barley and grasses which may reach the human mouth, settle around bad teeth, and thence pass to the lungs, the bone of the jaw, and even to the intestines or brain. Fortunately, this unpleasant fungus, which was once difficult to eradicate, has proved susceptible to penicillin.

The Venereal Diseases.

The venereal diseases are those caused—or at least that is what the name means—by the goddess of love, Venus. Venus, of course, causes a great deal of trouble, but venereal disease is not necessarily the worst she can do. There are two diseases usually caused by sexual intercourse, and therefore described as venereal; others can be caused in this way, but are not usually so described.

Gonorrhœa is the result of an infection by the bacillus of gonorrhœa, and ordinarily comes on after a period of three to seven days following intercourse. However, babies can get an infection of the eyes, known as ophthalmia, from their mother if she is infected, and gonorrhœa in young children is often the result of being in contact with infected towels or clothes. The disease in adults is evident when there is a thick, creamy discharge from the sexual organs and sometimes pain on passing water; in infants ophthalmia is prevented by the use of silver nitrate eye-drops at birth. Gonorrhœa is fairly easily cured by the use of sulpha drugs or penicillin; in fact, although the idea is not popular with moralists, it is much more easily cured than the common cold.

Syphilis is more serious, and is nearly always caused by sexual intercourse. Stories about lavatory seats are simply stories, although it is occasionally possible to get syphilis by other than sexual means: for example, it has happened that a man playing football has been infected through his hand being grazed by the teeth of someone with syphilis. But this is very unusual, although kissing can spread the disease. Children, too, can be born with syphilis (the so-called congenital syphilis).

Adult syphilis begins with a sore, known as a hard chancre, at the point where the spirochæte of syphilis has entered; this may be on the lips, through kissing; on the sexual organs, through intercourse; and very rarely, as explained above, elsewhere. In a short time the chancre disappears and all may seem to be well, but this primary stage is followed by a secondary stage with sore throat, a rash, headache, and enlargement of glands. This, if left alone, also clears up, but is followed by the tertiary stage, in which a chronic infection develops in some part of the body which, presumably, is most susceptible in the particular individual. Thus there may be chronic syphilis of the skin, the bones, the heart, liver, or nervous system.

In the nervous system, the commonest forms are the two diseases of *tabes dorsalis*, in which the spinal cord is infected, and G.P.I. (general paralysis of the insane), in which the brain and mind are affected. These will be discussed under Nervous Diseases.

In congenital syphilis the pregnant mother gives her child syphilis. Such infants are often still-born or premature, they look wizened, like a little old man, and amongst other symptoms are eye

disease, "snuffles," a flattened nose, and when the adult teeth appear the front ones may be notched at the biting surface.

The treatment, of course, is very much a matter for a specialist, but diagnosis is usually made through the Wassermann blood test. It was for syphilis that Ehrlich produced his "magic bullet"—an arsenical drug, known as salvarsan. This is still used in chronic cases, but when discovered early, penicillin seems to clear up the disease more rapidly. G.P.I., once hopeless, is now treated by malarial therapy with a good deal of success.

It is important to understand about venereal disease in general: (1) that it happens to many people who are no worse than anyone else; (2) that many patients believe themselves to have V.D. when, in fact, they have not; (3) that the best thing to do is to see your doctor as soon as possible—he is not concerned with your morals, and the sooner you go, the sooner you will get well; (4) every sore in the sexual area need not be V.D. There are other diseases which may be contracted as venereal infections.

Chancroid produces small septic ulcers around the sex organs, with swelling of the local glands in the groin, which may suppurate. It is caused by a bacillus, and can usually be cleared up by sulpha drugs within a week. Scabies and lice often pass from one body to another during sexual intercourse, but are not usually thought of as venereal in origin, although in many cases they are.

Tropical Diseases.

Nothing is more difficult than to define the term "tropical diseases." One might define them as the diseases which occur in tropical climates—but then measles occurs there too; and if they are defined as those diseases which are found *only* in the tropics, the solution is no easier, since leprosy, cholera, smallpox, and typhus are usually listed as tropical diseases, yet were found in this country until fairly recently—and the odd case still is.

But what a story could be told about the conquest of those infections which were—and many still are—the scourge of humanity! One day when generals and dictators are forgotten we shall remember that great international army of physicians and bacteriologists who have saved millions of lives and infinitely reduced human suffering: Koch and Ehrlich of Germany, Pasteur and Roux of France, Ross and Jenner of Britain, Reed of America, Noguchi of Japan, and many others. We shall remember how the Jesuit priests brought quinine from Peru to Europe in 1638, the first drug to save people from malaria; how in tropical heat Ronald Ross (1857–1932) peered for hours through his microscope to discover the connection between malaria and the mosquito until the sweat running from his brow rusted the instrument; how Major Walter Reed's work in Havana (1851–1902) made possible the building of the Panama Canal, and think, too, of the American soldiers who died in helping him to find the cause of yellow fever. In mentioning Jenner once more, we should recall Lady Mary Montagu (1689–1762), who brought the practice of vaccination to England from Turkey—or, rather, the practice of "variolation," which meant inoculating with the pus from smallpox cases. This was, of course, a dangerous practice, but the idea was there. Noguchi, one of the great bacteriologists of the nineteenth century, was the son of a poor peasant. He often had to steal to get enough bread even to keep alive, but was later to help in our understanding of syphilis and many tropical diseases.

Yet there is still much to do. Take, for example, the case of Egypt, one of the world's poorest countries, supporting with the help of water from the Nile about 24 million people. But if the river gives food and drink it does other things; for it carries the disease of bilharzia, which kills thousands of peasants yearly. In the villages of Egypt as many as 90–100 per cent. of the population suffer from this terrible disease. The infantile mortality rate is the second highest in the world—29·5 per cent.—seven times higher than that of Holland; the average expectation of life amongst the lower classes is thirty-one years, of the upper classes fifty to sixty years. The country is ridden with bilharzia, ankylostomiasis, malaria, plague, amœbic dysentery, typhus, tuberculosis, and pellagra. Blindness, due to trachoma and other diseases, affects tens of thousands. Such a situation cannot be treated simply by pouring drugs into the country; what is necessary is social control, to enforce purification of the water supplies, the use of insecticides such as D.D.T. to kill the disease-bearing pests, and removal of the causes of extreme poverty (tuberculosis and vitamin deficiencies which are common in Egypt are diseases of malnutrition).

Relapsing Fever, common in India and Africa, is caused by bad hygiene (rubbing infected lice into the skin); the germ is a spirochæte, similar to that of syphilis, but the disease is non-venereal. Relapsing fever gets its name from the fact that the temperature remains high (103–106°) for about a week, returns to normal for a week, and rises again. There may be three to five relapses of this sort. Cure can be brought about by the arseno-benzol drugs used in syphilis. Lice, of course, should be dealt with.

Epidemic Jaundice (also known as Weil's disease or—if you prefer it—ictero-hæmorrhagica spirochætosis), is also caused by a spirochæte, and spread by rats. Now it is rarely found in Europe, although it occurred in the trenches during the First World War, in men working in sewers, and in the women who worked in the fish market of Aberdeen, which at one time was rat-infested. It is rarely fatal, but leads to high fever and jaundice. Anti-syphilitic drugs are useless, but some of the new antibiotics may help.

Yaws is also a spirochætal disease, common in the tropics and particularly in children. It is unpleasant, but not serious, and tends to clear up in a year or so. There are raspberry-like growths on the skin, which disappear with the drugs used in syphilis (although the condition is non-venereal). The Wassermann reaction, positive in syphilis, is also positive in yaws.

Leprosy. Whereas syphilis, relapsing fever, epidemic jaundice, and yaws are caused by spirochætes, leprosy is caused by a bacillus resembling the bacillus of tuberculosis. Leprosy, in fact, should not be included here at all, for it is non-spirochætal, and not necessarily a tropical infection. But, apart from all the difficulties of classification already mentioned, leprosy *is* usually thought of as a tropical disease (although it is fairly common in Iceland and used to be so in Western Europe); it *is* thought to be deadly contagious (although it is, in fact, only very slightly contagious); and it *is* thought to be incurable (although young ladies with a mission in life who wish to go to a leper colony will find that it can be cured). One wonders why leper colonies exercise so much more attraction over some people than mental hospitals, T.B. sanatoria, or cancer clinics; but there it is. So there are many misunderstandings about this disease, and placing it in the wrong part of the medical section is probably the least.

Leprosy is not hereditary, and not very infectious without intimate contact, although this contact need not be necessarily sexual. It takes the from of nodules under the skin which form ulcers and can lead to the loss of a finger or toe. At first there is fever and large red patches which coalesce to form swellings with loss of sensation. The patches are on the face, forearms, and thighs; on the face they give a "leonine" appearance—*i.e.*, resembling the face of a lion. In other cases the main nerves in the forearm are affected, so that, as in the first type, the fingers and toes may drop off. Leprosy may go on for thirty or more years, sometimes getting better and then relapsing; occasionally recovery without treatment occurs. The treatment is an old Indian one in a modified form—chaulmoogra oil—and on the whole, it is fairly successful.

Plague is another disease caused by bacteria, common in Europe at one time, but now largely restricted to Asia. Nevertheless, it caused millions of deaths in Europe during the years

1348 and 1668, and was the "Black Death," which, indeed, changed the course of history. Interested readers may read Hans Zinnser's *Rats, Lice, and History* about this aspect of the disease. Plague is carried by the bite of the rat flea, but, once people become infected, spread may occur from one to the other by droplet infection—*i.e.*, by coughing and sneezing. After an incubation period of two to ten days, fever develops, rather like severe influenza, and in a day or two the glands in the groin begin to swell, followed perhaps by swelling of the glands elsewhere. This is the usual type of plague, but it is also possible to get disease of the lungs from droplet infection and blood-poisoning from infection of the blood-stream. Both the latter types are almost invariably fatal, and even the glandular type (bubonic plague) has a mortality of about 80 per cent. There is a vaccine to prevent plague before it develops and a serum which may be used on the sick.

Although we have little space to discuss the subject of plagues and epidemics in general, it is worth noting that serious epidemics have almost always followed wars, revolutions, and economic and political collapse. Thus the Black Death followed the break-up of the Roman Empire, and, in the fourteenth century, accompanied the end of mediæval civilisation. The Napoleonic wars were followed by other epidemics, and the wars of the 1830s in Europe were followed by influenza. In the most widespread outburst of influenza after the First World War, more people were killed by the disease than in all the fighting of four years. It is a reflection on the peculiar mentality of Man that this devastating epidemic, which affected almost the whole world, occupies little space in his history books—we still, with few exceptions, regard history as the doings of kings, queens, and generals. Yet, in 1918, 20 million men, women, and children died from influenza, and no cure has, as yet, been found! Later we shall see that many millions of people die yearly from starvation or vitamin deficiencies. Yet these facts—the real facts of life—we rarely hear about.

Protozoal Diseases.

Nearly all the diseases caused by protozoa are tropical diseases, although one of the best-known protozoans is the harmless amœba found in British ponds. Protozoal diseases are caused by these organisms, large in comparison with bacteria, which are really one-celled plants. Viruses are neither animals nor plants, are much smaller than the other two groups, and have some distinctive characteristics described elsewhere.

The only important diseases caused by protozoa are sleeping sickness or tryanosomiasis, malaria, and amœbic dysentery (as contrasted with bacillary dysentery), another disease, leishmaniasis—also known by the numerous names of kala-azar, dum-dum fever, and, in milder form, Delhi boil, Oriental sore, or Bagdad sore—will also be mentioned briefly. These infections are few, but important in their influence on Man; for, as Dr. Clark-Kennedy has pointed out, malaria until recently was responsible for one-fifth of all human sickness, sleeping sickness not so long ago caused a large part of Central Africa to be uninhabitable, and in some areas of the tropics there are probably more people with, than without, amœbic dysentery.

Malaria. The word, of course, means "bad air," just as "influenza" means "influence"—in Italian *influenza di freddo*—the influence of cold. Human beings have a natural tendency to suppose that, when two events occur together, then one must be caused by the other. Yet, although malaria and "bad air" may often go together, and influenza and cold, it does not follow that bad air (whatever that may be) causes malaria nor that cold causes influenza. In fact, the anopheles mosquito carries the amœba of malaria, and the mosquito prefers climates which some people might describe as "bad," but it is the amœba, not the air, which causes the disease. Anyhow, the unfortunate mosquito might well use the phrase honoured by many generations of schoolmasters: "It hurts me more than it hurts you!" For the mosquito, too, is sick, and passes on its sickness to the person it bites.

There are several types of plasmodium—which is the scientific name for this amœba—producing attacks of fever varying in severity and frequency: benign tertian, quartan, and malignant quartan. Entering the body from the mosquito bite, the parasites penetrate the blood cells, multiply there, and finally burst into the blood stream. When this happens the temperature rises, and then they return to the cells to carry out once more the same procedure. Depending on the type, the attacks of fever may be at intervals of three or four days, severe or milder. When someone with malaria is bitten by a mosquito the infection can be transmitted to the next person it meets, but malaria is not infectious from one person to another directly. Quinine, of course, is the time-honoured remedy, but many other drugs are now available: mepacrine, palmaquine, atebrin, and even a sulphonamide derivative known as promin have been tried. The drug must be taken long enough for the infection to die out, otherwise relapses can occur even after leaving a malarial country (but it is only fair to say that, just as some people continue to give themselves the title of "Major" when they have left the Army, so others long in Britain continue to describe attacks of cold or 'flu as "my old malaria again," when, to say the least of it, they are exaggerating).

Important as are the drugs used in the treatment of malaria, even more so is the control of the parasite-bearing mosquito. The eggs of mosquitoes hatch in water, and there the young or larvæ forms can be attacked by pouring oil on the surface of pools so that they are unable to breathe, or by introducing small fish which have a partiality for them. Adult mosquitoes can be killed by D.D.T. and other insecticides or kept away by nets over beds and skin creams. Finally, anti-malarial drugs can be taken in dangerous areas. Whereas mosquitoes were once well on the way to getting rid of Man, now Man is well on the way to getting rid of mosquitoes.

Blackwater Fever is a sequel to malaria in tropical Africa and some parts of India. Rather illogically, it is described as "Blackwater," although the urine is red and the skin is yellow but the result is due to breaking down of the red blood cells by some malarial toxin. Possibly too much quinine may help in producing the illness. Treatment is to give plenty of fluids and no quinine or any other anti-malarial drugs in the early stages. The death-rate is about 25 per cent.

Trypanosomiasis or sleeping sickness—not to be confused with *sleepy* sickness, which has already been dealt with under the name of encephalitis lethargica—is essentially an African disease (although also found in tropical America) spread by the tsetse fly. Its cause is the type of protozoan known as a trypanosome, almond-shaped with vibrating membranes at the sides which enable it to move through the blood-stream, rather like a flat fish in the water.

There are three stages of the disease: first, the stage of fever with enlarged glands and a rapid pulse, which may continue off and on for three years; secondly, the stage of trembling hands, legs, and tongue, vacant expression, and slow and stumbling speech; thirdly, and lastly, the stage of low temperature, apathy, wasting of the muscles, and possibly death.

Treatment is with arsenical drugs—such as tryparsamide or Bayer 205—which give good results in early cases. Preventive measures in infected areas include the destruction of tsetse flies by insecticides, the cutting down of forests near rivers which are inhabited by tsetse flies, and some authorities have suggested the shooting of big game which may form a "reservoir" of the parasites, whence tsetse flies can carry them to human beings. For similar reasons infected people should not be allowed to move to non-infected areas.

Amœbic Dysentery, also known as *Amœbiasis*, is caused by the *Entamœba histolytica*, an amœba whose cysts are found in food, water, or spread by infected fingers or flies. There is mild fever and

diarrhœa which contains blood. The disease may become chronic, and can cause abscesses, usually in the liver but sometimes in the lungs. Amœbiasis is treated and usually cured by injections of emetine hydrochloride, but in the chronic phase the drug known as Yatren is used in the form of an enema.

Leishmaniasis, kala-azar, or dum-dum fever, is another amœbic disease, probably spread in this instance by the bite of sandflies. It is also known as tropical splenomegaly—enlargement of the spleen in ordinary language—since infection results in enlargement of the spleen and liver, low, irregular fever, and death within a year or so. A milder form, affecting the skin, is known as Delhi boil, Oriental sore, or Bagdad sore, does not lead to kala-azar, and is fairly readily cured. The cure for both conditions is to give injections of tartar emetic, which reduces the death-rate from kala-azar from 80 per cent. to about 5 per cent.

Diseases Caused by Parasitic Worms.

Many types of worms infest human beings and other animals. They are interesting for such reasons as their size (which may range from the almost invisible to 30 ft. or more), their life histories, and their serious or trivial consequences on their hosts. We shall mention only a few groups here, and mainly the ones likely to be met with in Europe—the tapeworms, the roundworms, and the threadworms—although some tropical types will be described briefly.

Tapeworms, as we have seen earlier, like many other types of intestinal worm, lead a double life. What usually happens is that the worm breeds in the human intestine, the eggs pass out in the fæces, and are then swallowed by animals eating contaminated material. In the animal the eggs hatch out into larvæ—primitive forms which penetrate the muscle, forming cysts—and Man is infected in turn by eating its meat. Thus *Taenia Solium* gets into the flesh of pigs, which, if imperfectly cooked (measly pork), causes infestation of the intestine in Man. It reaches a length of about 10 ft. *Taenia saginata*, which reaches a length of about 20 ft., is spread in imperfectly cooked beef, and in Baltic countries *dibothriocephalus latus* gets into the human intestine from caviare or undercooked fish. It reaches the awesome length of 30 ft.

Now all the worms we have mentioned so far are found in the human intestine, and the cysts, which are much more dangerous and unpleasant, in the animal's muscles. But in some worms the reverse happens, with the adult in the animal's intestines and the cysts in Man. Thus in Australia the dog tapeworm (*taenia echinococcus*) produces cysts in both sheep and Man. This is known as hydatid disease, and may remain unsuspected until cysts in the lungs, liver, or elsewhere become infected or rupture. *Trichinella spiralis* is similar in action, being found in the intestines of pigs and getting into the muscles or other organs of Man. The main difference is that this worm migrates from the pig's intestines into its muscles, whence it reaches Man in undercooked pork meat or sausages. The muscular cysts cause swellings and sometimes pain. There are changes in the blood, swelling of the face and leg in the early stages, and fever. A minor epidemic occured in England in 1941. *Taenia echinococcus* and *trichinella spiralis* are small—not more than ¼ in. in length—but are more serious in their consequences than the large worms. Treatment is very difficult, and ordinarily all that can be done is to deal with individual cysts when they make themselves apparent.

The large tapeworms, *taenia solium* and *saginata* and *dibothriocephalus latus*, produce varying symptoms or none at all. Usually they are not discovered until some segments of the worm are excreted, but there may be mild indigestion, excessive hunger, and occasionally anæmia. However, when the worm is discovered the patient, not unnaturally, is likely to become anxious and uncomfortable at the thought of "having" a tapeworm; these symptoms are caused by the worry rather than the worm.

Treatment is, of course, a matter for a doctor, but purging followed by extract of male fern is usually successful. One has to make sure that the head of the worm has been removed, otherwise it will continue to grow.

Roundworms are similar both in appearance and size to ordinary earth-worms and the eggs reach Man, not from an animal, but from the contaminated fingers of someone else who handles food. They give rise to no symptoms, and are noticed only when discharged in the fæces or occasionally vomited up. They can be removed by the use of santonin.

Threadworms, as the name suggests, are like small ⅛–½-inch-long pieces of white thread. They are very common in children, and live mainly in the cæcum—*i.e.*, the part of the large intestine near the appendix. The males, which are the smaller ones, remain there, but the females pass down towards the rectum at night-time and lay their eggs in the area around the anus. Infection is by contaminated hands handling food—especially uncooked food—and water. Threadworms are not serious, and cause few symptoms other than itching around the anus and between the legs, but heavily infected children may show symptoms of anæmia. The nervousness often shown by such children is usually the result of the irritation produced by the worms in the anal region. Infection is not common in adults, and in children tends to disappear at puberty.

Treatment is, in theory, simple; for the worms are easily destroyed by a number of drugs, such as gentian violet, thymol, or one of the proprietary remedies. Ointment is applied to the itching area, and the child should be prevented from scratching. However, since the eggs may lie about the house for some time, reinfection often happens, especially if there are several small children in the home who may pass the disease from one to another.

The idea that intestinal worms in general are likely to cause loss of weight by absorbing food eaten by the patient is largely mistaken; for, although it is true that they do live on this food, the amount taken is certainly not enough to be significant.

Tropical Worms. *Bilharzia* has been mentioned before in connection with its frequency in Egypt, although it is also found in other parts of Africa, Arabia, and Iraq. There are two main types: one infecting the bladder (*schistosomum hæmatobium*), the other the rectum (*schistosomum mansoni*). Bilharzia is more correctly known as schistosomiasis.

The parasite's fantastic life-history begins when a man bathes in infected water, and the small swimming forms known as cercariæ pierce and enter his skin—or they may enter the body by drinking infected water. From the skin they pass to the portal vein below the liver, remain there six weeks until they become adult and then swim against the blood-stream down to the pelvis, where the female lays eggs which have a sharp spine. The eggs penetrate into the bladder or rectum—depending on the type of fluke—and pass out in the fæces or urine. If they enter water they hatch out into small moving forms which seek out a water-snail, develop further in its body, and leave it in the form of cercariæ ready to find a new human victim. The female fluke is slender and round, about 1 in. in length, the male, flat and leaf-shaped, is about ⅓ in. long, and, as we have seen, their grisly courting takes place in the portal vein, whence the impregnated female passes to the bladder (hæmatobium) or rectum (mansoni) to lay her eggs.

Infection results in raised temperature and, in the urinary type, blood in the urine; in the intestinal type blood is found in the fæces, and there are symptoms resembling dysentery—*e.g.*, diarrhœa. Treatment in both cases is by injections of antimony tartrate. Needless to say, attempts should be made at prevention by telling people to avoid infected canals (usually easier said than done), and by periodically cutting off the water supply to the canals to kill the snails.

Without treatment, the disease may go on for many years, when it may recover of itself or lead to slow death. A third type of schistosomiasis is found in the Far East (*schistosomum japonicum*);

it is similar to the intestinal type described above, and the treatment is the same.

Hookworm Disease, or ankylostomiasis, is found in many parts of the world, especially in miners who work on damp ground. It has even been found in Cornwall! The tiny worm enters the body usually through the feet, passes through the blood-stream to the lungs, eats through into one of the bronchial tubes, climbs the windpipe, and passes down the œsophagus into the stomach to end up in the duodenum. It causes anæmia, can be fairly readily cured, but is occasionally fatal.

Elephantiasis. Some types of parasitic worm are spread by insects. Thus in *Filiarisis* mosquitoes inject by their bites the infantile forms of a tiny worm which enters the lymphatic channels; there the blockage they cause leads to the swelling of the legs and the lower part of the body, known as elephantiasis. In the evenings, when mosquitoes usually fly, the newly born infantile forms pass into the blood-stream, where they are sucked up by other mosquitoes to infect more hapless humans. So far, no certain cure is known, but antimony tartrate in some cases seems to give good results.

Lice and other insect pests will be dealt with under skin diseases.

PHYSICAL INJURIES

INTRODUCTION.

Our bodies are subject to physical injuries as well as to bacteriological and other ones, so here we are going to deal with injuries caused by such things as falling, cutting and piercing, changes in pressure of the surrounding atmosphere, atomic radiation, and poisons. Obviously the subject is much too large to be dealt with except very briefly, and in any case most of these injuries, other than the most trivial, have to be treated by specialists.

Falling may occur either when we trip or slip or are knocked down whilst our feet are already on the ground, or when we fall from a height. In the first case we are likely to have to deal with fractures or bruises, but in the second the injuries, although of a similar nature, are more serious. Also, whereas in the first case there need be no great mystery about the injuries produced, in the second we have to consider a number of factors. For example, if someone falls out of a window a great deal depends on the momentum of their body when they hit the ground, and momentum is weight multiplied by velocity. So, by and large, the heavier the body and the farther it falls, the greater the damage is likely to be. Thus an ant could fall from the top of a skyscraper without much injury, because it is too light to possess much momentum, and a baby falling from a first-storey window is less likely to be badly injured than its mother should she fall.

Other factors, of course, are also important—for instance, *how* someone falls and *on what part of their body*. Falling on the head, other things being equal, is more dangerous than falling on the side. So, too, as parachutists are taught, some ways of landing are safer than others: it is important to have the muscles relaxed, to land feet first, and gradually as it were " crumple up." That is why drunk people often get off so lightly when they fall, since their muscles are relaxed.

Car Injuries are another type of " fall " peculiar to our own age of fast-moving transport. If we think of a fall as being essentially a change in momentum, then we can so describe the situation when a car or an aircraft travelling at speed is suddenly forced to stop. When this happens, the vehicle in which we are moving stops, but our body goes on; hence in air-liners suddenly brought to a halt the passengers may be thrown forward with such force as to be killed or seriously injured. (This, of course, is why seat belts are used prior to taking off or landing.) In a car, too, collision or sudden braking from great speed may cause the passengers to be thrown through the windscreen or against some part of the car, bringing about death, often from internal injuries, even when the vehicle itself is only slightly damaged.

Bruises and Abrasions. A bruise occurs when a blow to some part of the body damages the underlying tissues without breaking the skin. At first there may be little to see, but, later, bleeding under the skin causes the typical " black-and-blue " appearance, as in a black eye. The black-and-blue coloration is caused by breaking down of the blood pigments when they get into the tissues. A similar appearance can result without physical injury when a varicose vein ruptures; in both cases the coloration may pass down under the skin—thus a small ruptured vein in the thigh may cause black-and-blue pigmentation in the lower parts of the leg.

None of this is usually serious. If there is no pain, nothing need be done, but if there is, cold compresses or lead lotion on lint may help; the colour goes in its own good time, and is not changed by any treatment.

An *abrasion* is an injury in which the skin is broken without the injury being deep. It should be treated as a shallow wound—that is, it should be washed in soap and water and a clean dressing with Vaseline applied to prevent sticking. If desired, the injury may be washed with a reliable disinfectant (Milton, Dettol, or some other); but only the first time, and the *washing with disinfectants should not be repeated*. The reasons for this are: (*a*) that all disinfectants delay healing if continued; (*b*) that, after the first application, the dangerous germs are deep down beneath the surface and out of reach.

Wounds may be classified in many different ways. Thus we may talk of superficial wounds, meaning that they are not deep—but a shallow wound in some parts of the body (for example, in the wrist or the neck) could be serious if one or other of the important blood-vessels or nerves lying near the surface are injured. Wounds in these areas must be treated as important if there is much bleeding or, in the case of the hand or foot, loss of feeling or movement. In fact, *any* wound needs medical attention in either of these circumstances, or if there is shock or the possibility of bacterial contamination.

Other wounds may be deep and wide on the surface, whereas some may be deep with a small entrance wound. The latter are known as penetrating wounds, and are usually due to sharp piercing instruments such as knives or bullets. There is likely to be a good deal of shock and hæmorrhage and greater or less damage to internal organs (although a penetrating wound may miss organs one would have expected it infallibly to pierce). If abdominal organs are penetrated sepsis may be spread from *inside* the body by the intestinal contents escaping into the abdominal cavity. This can result in peritonitis.

The Response of the Body.

It is typical of all living things that they react to changes in the environment, whether this takes place at the highest level of the mental processes or at the simpler level of response to injury or disease. This is what is described by scientists as the principle of *homeostasis*, which means that there exists a tendency to maintain the body in a constant state. Thus, to take some examples, if the body loses fluid from sweating, thirst arises and the urine becomes reduced in amount and more concentrated, so that, on the one hand, fluid input is increased and output decreased until the balance is restored. If salt is taken in excess of requirements the amount of urine is increased to wash away the excess. So, too, the amount of the sugar circulating in the blood normally remains constant no matter how much is taken in, the excess being stored in the liver in the form of glycogen, which is similar to starch; if still more sugar is taken in it is transformed into fat.

Now, when the surface of the body is broken, as in wounds, similar attempts at restoring the original state are made. First, bleeding occurs, which tends to wash away dirt and germs, then the blood clots, forming a sort of seal over the wound. New cells known as fibroblasts, increase in number and grow into the clot, knitting the edges of the wound together. Capillaries (*i.e.*,

tiny blood-vessels) grow into the clot, too, to carry to the injured area food for the growing cells and substances (antibodies) which combat any germs which have got in. Finally, the fibroblasts shrivel up and contact, drawing the edges of the wound together just as a doctor's stitches would, and the situation of the wound is shown only by white scar tissue.

It should be noted that the more complex body cells do not regenerate. When a muscle is cut, for instance, the cut area is not filled by muscle cells but by scar tissue; nerves can regenerate provided the injury is only to the nerve—the long filament which stretches from the parent nerve cell—but when the cell itself is destroyed regeneration is impossible. Even so, the body does its best; for the scar tissue uniting a cut muscle is strong and remains as a sort of adhesive holding the ends together, and in brain damage, although the destroyed cells never grow again, others take over their function as far as possible. (There are so many brain cells in excess of what we actually need that even quite extensive brain damage may lead to little practical defect, but much depends upon what area of the brain is affected.)

When sepsis occurs in a wound, whether it be a pin-prick or a larger injury, local attempts are made to solve the problem. We have seen that blood aids in this by creating substances which destroy the germs or their poisons, and the white blood cells, known as phagocytes, destroy the germs as an amœba swallows its prey. Substances known as agglutinins cause the germs to clump together so that they are more easily dealt with. Finally, new cells form a fence around the infected area, cutting it off from the rest of the body–this, of course, applies to boils and abscesses as well as to wounds.

If, in spite of these local defences, the sepsis spreads, the body responds by producing more phagocytes, more agglutinins, and more antibodies or antitoxins. Fever, too, occurs, and is one of the signs that a wound is septic and that the sepsis is spreading. But there are intermediate defences, because the lymph vessels carry the germs to the nearest lymph glands· in the arm-pit in the case of the arm, in the groin in the case of the leg, and elsewhere throughout the body. The passage through the lymph vessels is marked by red lines on the arm or leg (lymphangitis) or swelling of the glands (lymphadenitis). These, too, are danger signals after any sepsis, because they mean that the first line of defence has broken down and that medical treatment is urgently needed.

Haemorrhage may be small or great in amount, and may come from a vein or an artery. If from a vein, the blood is dark and flows slowly, if from an artery, it is bright red and the flow pulsates. If the bleeding is severe there is shock and the blood-pressure is lowered, but once the trouble is over, new blood cells develop in the bone marrow to replace those lost. A doctor may aid this process by giving iron in mild cases or by blood transfusion in more serious ones.

Of course failure may result. There may be shock, which is caused by the liberation from damaged cells of a substance known as histamine, and this may cause danger to life in some cases. Or infection sometimes breaks down each line of defence, leading to blood-poisoning. Or excessive bleeding which cannot be stopped can also lead to death—in the blood disease known as hæmophilia the blood fails to clot, and even a slight injury may bring about fatal results from continued slow bleeding.

Fractures are classified according to whether they are simple or compound, that is, whether there is a wound over the area or not, the latter being the more dangerous, because of the possibility of infection. Or one can classify them according to whether the broken parts are separated; for obviously parts which are not separated are likely to heal with greater ease (in children, when the bones are softer, the type of fracture known as the "greenstick fracture," in which the bones bend rather than completely break, is common). Lastly, they can be classified according to the bones broken; for, depending, of course, on the seriousness of any particular injury, the possible complications differ in various areas of the body. In head fractures, concussion, injury to the brain, serious hæmorrhage, and sometimes mental changes can occur; in spinal fractures, when the spinal cord which passes through the bony tube is damaged, there may be paralysis or death, depending on the level of the injury; in fractures of the ribs or pelvis internal organs, such as the lungs or bladder, may be torn or ruptured—although this is not too common.

Certain parts of the skeleton are more liable to fracture than others, so, although in theory any bone in the body may be broken—even the small bones of the hand, foot, or wrist—two of the best-known types of injury are Colles' fracture of the wrist (caused by falling on the outstretched hand) and Pott's fracture of the ankle (often caused by slipping off the edge of a pavement). These fractures, of course, are named after the surgeons who first described them. Signs of danger in the case of other types of fracture are: in the skull, unconsciousness, confusion, bleeding from the nose or ear; in the ribs, pain on taking a deep breath; in the pelvis, passing of blood in the urine. Injuries to the skull or spine should always be regarded as potentially serious, although they are not necessarily so.

Injuries to the skull take many forms. A blow may render the patient unconscious, and there is usually loss of memory for the few minutes *before* the accident, although this is not necessarily serious. On the other hand, a relatively slight blow may tear a blood-vessel (middle meningeal hæmorrhage), causing little or no disturbance of consciousness, but leading to death in a few hours. (For example, those who have been drinking may fall, apparently lightly, on the head, be taken to a police cell and found dead in the morning due to this type of hæmorrhage.)

Then there is the hazard of boxing which results from many blows to the head during fights—the condition of being "punch drunk." Such injuries can lead to loss of memory, mental dullness, and sometimes criminal behaviour; the "punch-drunk" boxer at the best degenerates into a sparring partner or a pathetic exhibit in a Fun Fair, taking on all comers. At the worst he may become an inmate of a prison or mental hospital.

Bones heal by the formation of a bony substance between the severed ends known as "callus." But first the bones have to be joined, and this is done by splinting or plaster casts; in some cases by nailing the bones (especially in the case of fracture of the head of the femur—that is, where the thigh bone joins the hip joint—a fracture often found in old people). Lastly, bone grafts can be used in difficult cases and a piece of bone from someone else or from the same person used to join the severed fragments.

Burns. Burns are ordinarily caused by fire or by boiling liquids, but they may also be caused by corrosive fluids, such as strong acids or alkalis. There are three degrees of burns: first-degree burns produce simply a slight redness of the skin, as in a mild scald; second-degree burns damage all but the deepest layers of the skin; third-degree burns cause damage right down to the tissues beneath. Generally speaking, burns are not dangerous if they involve less than one-third of the body's surface; but second- or third-degree burns involving more than one-third of the body are a serious danger to life.

So we have to consider, first, the depth of the burn, and secondly, its extent. The second factor is usually more important than the first. In any burns other than those which are trivial, the following rules must be observed:

(1) Treat for shock (*i.e.*, warmth; hot, sweet tea; and disturb the patient as little as possible).

(2) Use *absolutely nothing* in the way of dressings on the burn, and certainly not ointments or fatty substances.

(3) If there is likely to be a long wait for medical attention, bathe or submerge the patient in a bath of salt or baking soda (one teaspoonful to a pint of water).

(4) Leave the burned clothes alone, and on no account try to remove them.

Skin Grafts. In any injury, whether it be a wound or burn, new skin grows in slowly from the edges. But this cannot go on regardless of the size of the wound, and so a large denuded area has to be filled in with skin from elsewhere, and ordinarily this is taken from the thigh. Grafts may be taken in the form of large shavings of the upper layers of the skin which are spread over the denuded area, or small pieces (about ⅛–¼ in. in diameter) may be scattered over it.

Injuries caused by Atmospheric Conditions.

Changes in atmospheric pressure are found in two circumstances: when we go very deep down or very high up. Ordinarily, the air at ground level presses on our bodies with a pressure of 30 lb. to the square inch, and this has two effects: it keeps the lungs expanded against the ribs, and so makes breathing possible (if the chest is punctured the lungs collapse, since the pressure is then the same on both sides of the chest wall), and it forces oxygen and nitrogen into the blood-stream (the oxygen is necessary to life, the nitrogen is not, but both gases are the main components of air).

Now, it follows that when atmospheric pressure increases more of these gases are dissolved, or forced, into the blood, and when it decreases the gases—nitrogen in particular—start coming out. This becomes a problem only when the nitrogen comes out too quickly due to a sudden reduction in pressure. For example, in deep-sea diving or in caissons—the diving-bells used in underwater engineering construction—pressure may rise to four times the normal because in diving-suits air has to be forced down and in caissons the pressure has to be raised to keep water out. If, in such a situation, decompression is too sudden the blood in someone being raised too rapidly to the surface literally effervesces: the nitrogen leaves it in the form of bubbles, which may cause pain in the muscles, temporary paralysis, or even death from bubbles reaching the brain. The muscle cramps, once known as "the bends," are now uncommon, since the risks are well known and decompression is gradual. The treatment is to send the man down again and raise him gradually.

A similar condition, *Decompression Sickness*, occurs in aircraft flying at a height of 30,000 ft. or more. Since pressures are lower at high altitudes, the nitrogen leaves the blood and causes symptoms like those of caisson disease, although milder. This, of course, does not occur in modern pressurised aeroplanes, in which the pressure remains constant at any altitude.

Sunstroke. Until fairly recently it was usual to distinguish between sunstroke and heat-stroke, the first being supposedly caused by the direct influence of too much sun, the second being caused by excessive heat—for example in a steel foundry. In point of fact, there is no such thing as sunstroke, and both conditions are caused by excessive *heat*, whether brought about by the sun or under industrial circumstances. There is, therefore, no need whatever for sun-helmets or spine pads in the tropics; for the fact is that the head can be exposed to any amount of sunshine, and, provided that the body is kept cool, the worst that can occur is painful sunburn (especially in those with bald heads).

The symptoms of heat-stroke are headache, dizziness, and high fever; treatment is directed to reducing the temperature by cold bathing, ice packs, and cold drinks. When the condition occurs in industry there may be cramps caused by excessive sweating; in this case saline solution—one teaspoonful of salt to a pint of water—should be given. Heat cramps occur mainly in hot, moist atmospheres: in stokers, miners, and steel workers.

Frost-bite. This condition, well known by name if not experience, occurs in climates where one is exposed to severe cold—especially when this is accompanied by high wind and great altitude. The cold causes the small blood-vessels, mainly of the feet and hands, to contract, and later there is release of histamine, which produces shock and dilation of the vessels. The result is œdema or swelling, large blisters, and gangrene. Frost-bite is avoided by the use of warm clothing and soft, well-greased boots or gloves.

The treatment which should not be used is the one read of in books—rubbing with snow; heat, too, is to be avoided. The proper treatment is to keep the part moderately warm between the thighs or armpits of a comrade, having previously cleaned it with mild antiseptic and covered with clean wool or gauze. Sometimes amputation is necessary, but this should be delayed as long as possible, since some degree of recovery is always likely.

Sea-sickness, which troubled Lord Nelson more than the French warships, has been widened in scope in the natural course of technical progress by the addition of train-, air-, and car-sickness. All are due to the same cause: a rolling or up-and-down motion which affects the organs of balance, and, it must be added, a large element of imagination. There are many modern drugs which can prevent the trouble: antihistamines, sedatives, hyoscine, amphetamine, but nearly all of these are unobtainable without a prescription, and in any case one has to discover by trial and error which is most suited to the individual case. The solution, then, is to ask your doctor's advice.

The Effects of Atomic Radiation.

Here we are concerned with injuries produced by rays similar in nature to those of light which cause sunburn, but shorter in wavelength and more penetrating. Such rays do not necessarily arise from the explosion of nuclear weapons; for they include X-rays and the alpha, beta, gamma, and neutron radiation produced by radioactive elements as they spontaneously disintegrate or disintegrate artificially in a cyclotron. In addition, they include the cosmic rays which enter the Earth's atmosphere from outer space, all of which are dealt with in greater detail in the Science Section.

Radiation of this type is dangerous to the human body, but it is dangerous in a selective way, damaging the skin, the bone marrow, and the sex cells. Thus, exposure to X-rays for a comparatively brief period leads first of all to reddening of the skin after an interval of from a few days to two weeks, and a still longer exposure causes permanent destruction of the hair follicles so that the hair does not grow again. The penalty for considerable exposure to X-rays or the emanations of radium is, as the early workers found to their cost, chronic ulceration with the possibility of cancer. But this is not all. Ionising radiation destroys the bone marrow which produces red blood cells, and can thus lead to fatal anæmia, known as aplastic anæmia. There is also considerable evidence that leukæmia, in which the white blood cells proliferate, is on the increase and may be caused by radiation. Acting on the sex cells of men and women, fertility is decreased, and those children who are born may be abnormal; large doses cause sterility. Nuclear weapons produce the ordinary results of any explosion—blast and burning—but radiation is their peculiar speciality, as was shown when the Japanese fishing-boat *Fukuryu Maru* was showered with radioactive dust during an experimental explosion at Bikini in 1954. In this case the fall-out of an explosion many miles away killed one of the crew, and subsequent study has shown that the radioactive cloud which follows such an event may travel several times around the world before settling. A report published by H.M. Stationery Office (*Hazards to Man of Nuclear and Allied Radiation*) in 1956 belittles the influence of atomic explosions, which, it says, at the present rate will not increase radiation more than 1 per cent. But what is given with one hand is taken away with the other; for it is pointed out that X-rays as used in medicine may increase the danger to the sex-cells by 20 per cent., and that H-bomb explosions produce radioactive strontium, which by replacing the calcium in our bones can cause serious disease. The amount of radioactive strontium in the atmosphere is already at a dangerous level, and if explosions continue the position in the not too distant future will be serious. It is known, too, that the total amount of radioactive material surrounding us is in-

creasing, whether from nuclear weapons, industrial sources, medical instruments, or even the apparently innocuous luminous wrist-watch. These are the facts, and even if the danger were a good deal less than it is, they would be worth considering.

Atomic Medicine.

Radiation of the type we have been discussing may also be useful to Man, and for many years it has been known that X-rays can not only bring about cancer but also cure it. More recently, however, use has been made of radio-isotopes—that is, elements which have been made radioactive in a cyclotron. In medical and biological research such elements are capable of being traced throughout the body by the use of special instruments, so that it is possible, for example, to find what happens to iron from the moment it is taken in to the moment when it is built into the red blood cells which carry oxygen around the body. Similarly, the growth of animals and plants may be studied in detail. Such activated atoms are known as "tracers," and it seems likely that much more will be found out about biological processes with their aid. *See also* F54.

Radioactive substances are also used in the treatment of disease. Thus cancer of the thyroid has been treated for many years by means of radium or X-rays, which have the defect that they do not penetrate deeply enough unless they are so powerful as to damage tissues other than the tumour. Now, iodine entering the body ultimately reaches the thyroid gland, and when this iodine is made radioactive the radiation which destroys the cancer cells is given off within the gland itself. And it does this with the least possible damage to surrounding tissues, with the additional advantage that it can be taken by mouth in the form of a "radioactive cocktail."

DRUG ADDICTION

INTRODUCTION.

Poisoning.

This is a common enough event if we include under the term our own prejudices: "intestinal poisoning" (the polite name for constipation); alcoholism (if we don't like alcohol); and even meat (if we happen to be vegetarians). However, here we are talking of poisons in the sense that Dr. Crippen and other gentlemen understood—substances which are seriously dangerous to life. Such substances need not, of course, be used with any criminal intent, and in fact some of them gain entry to the body in quite innocent ways. Thus mercury, once used in the treatment of syphilis, can cause chronic poisoning, as also can lead and many other substances used in industry. There is, too, the curious state of *allergy*, dealt with elsewhere, in which substances not ordinarily harmful to human beings cause illness and sometimes death in those who are sensitive to them. There is nothing so harmless that it cannot cause harm to *someone*, nor is there anything so harmless that in sufficient amounts it cannot cause harm to *anyone*.

There are poisons such as prussic acid and its derivatives which are almost instantaneous in their action; others which, if given in relatively small doses, produce sooner or later symptoms which often mimic those of disease (*e.g.*, mercury, lead, arsenic). Some poisons have unusual effects, as strychnine, which causes fits, and curare, formerly used on the tips of poisoned arrows, which causes paralysis. Curare is now used in surgery to relax the muscles during an operation. Lastly, there are the supposed "poisons" which fond imagination endows with dangerous properties, particularly towards nagging wives, boring husbands and mothers-in-law; of these ground-up glass is perhaps the chief. Regrettably or otherwise, it must be reported that ground-up glass is completely harmless—unless, of course, the pieces are so large and sharp that even the least suspicious victim might have reason to wonder. So, too, cigarette ash, which is supposed to have an effect (one wonders what) when dropped in someone's drink, is quite innocuous. Sea-water, which, it is alleged, causes the shipwrecked mariner who is rash enough to drink it to go mad, produces no such effect—however, it does increase thirst.

Each poison has its appropriate antidote, but here only general rules can be given. These are: (1) send immediately for a doctor; (2) give drinks of milk, white of egg, or strong tea; (3) afterwards, give as much as possible of a mixture containing a heaped teaspoonful of salt to a cup of warm water—which should cause vomiting; (4) when a narcotic poison has been taken (*i.e.*, one which makes the patient sleepy), keep him awake by walking him about and by giving strong tea or coffee.

Every doctor has the experience of being asked by patients from time to time whether the medicine they have been given is a "drug"—to which the only sensible answer would be: "It depends on what you mean by a drug." (The *Oxford Dictionary* defines the word as a "simple substance used alone or as an ingredient in medicine.") Thus defined, all medicines are drugs, from Epsom salts and baking-soda to heroin and cocaine. Presumably what the questioner really means is whether the drug is one that causes addiction; but this problem is not a simple one. Tea and coffee are drinks containing "drugs" such as caffeine to which many people are addicted in the sense that they would feel uncomfortable without them. In fact, at least four-fifths of the human race is addicted to some drug or another, and those who take strong purgatives every night are certainly addicts, even if they describe their abominations as "medicine." As Dr. Bergen Evans points out, it is probably a bad thing to take drugs, but it is unquestionably a bad thing to talk nonsense.

Let us be clear, then, about some basic facts. First, in many cases drug addiction is the *result* of being mentally unbalanced and not the *cause* of it; secondly, the drug addict as seen in the psychiatrist's consulting-room or the police court is a specially selected type, in that he is the one who is so obviously unbalanced as to be found out; thirdly, and as a corollary to the second point, the majority of drug-takers are apparently ordinary people who are never found out. For example, Coleridge and De Quincey, two of our greatest writers, took huge amounts of opium, and were both creative in their profession and lived to a ripe old age. Indeed, not much more than a century ago, opium was in fairly general use amongst the working-classes of this country both as a medicine and to add to their beer or tobacco. These people took opium as today we take cocktails, and did not necessarily become addicts, nor crave for more. In point of fact, alcohol is more dangerous than opium or morphine when taken in large amounts by unstable individuals, and one authority goes so far as to say that alcohol causes infinitely more murders, rapes, and crimes of violence than do morphine, heroin, cocaine, marijuana, and all other drugs combined. In the graphic words of Dr. J. D. Reichard, who is an authority on narcotics: "An alcoholic gets drunk, goes home and beats his wife; an addict to morphine gets 'high,' goes home, and his wife beats him." The narcotic drugs decrease rather than increase (as alcohol does) the sexual and aggressive impulses.

Taking narcotic drugs, except under medical advice, is both dangerous and a crime. But, morally, the crime belongs as much to society as to the individual. The drug addict, like the homosexual, is in two senses the result of social influences: in the first place, he is likely to be an over-sensitive and insecure individual who cannot stand up to the demands of our high-pressured competitive society. In the second place, when society (rightly or wrongly, since we are discussing facts, not morals) makes his behaviour illegal, he is forced into all sorts of subterfuges in order to carry on what to him is really a compulsive need. Hence, drug addicts are often the victims of blackmailers or steal in order to get supplies of the drug, just as homosexuals may be blackmailed or otherwise get into trouble with the law. Others may get supplies of their drugs easily or carry on their sexual peculiarities at home and never be found out.

Ordinarily well-balanced people need not fear becoming addicted to a drug prescribed them by

their doctor. The treatment for those who do become addicts will not be discussed here, since the only hope for cure is in a hospital dealing with such cases.

Alcoholism.

This is a problem on its own in that its use is so widespread and, by and large, socially accepted. But what makes a person an alcoholic is not only the amount he takes but the underlying emotional tensions which make alcohol an absolute necessity to him. It is possible for some people to drink a great deal but yet to be able to "take it or leave it," which is what the alcoholic cannot do.

This is a subject about which most of us hold such strong opinions (not always based on fact), that we had better look at the medical evidence. To begin with, it used to be taught that alcohol caused the following conditions: alcoholic neuritis, chronic gastritis, cirrhosis of the liver, and certain forms of insanity, such as delirium tremens ("D.T.s"), and the so-called Korsakow's psychosis, in which there is loss of memory and finally dementia. These statements are not untrue, but have to be modified by others: cirrhosis of the liver is found in many people who have never drunk anything stronger than tea, and, although it may be found in alcoholics, is not very common; alcoholic neuritis (which is due to lack of vitamin B1) is common in heavy spirit drinkers, but not in beer drinkers—since beer contains the vitamin; gastritis can be caused by any over-indulgence in piquant foods or drinks, such as curries, strong tea which is constantly "stewed," or alcohol.

It seems that the basic cause of physical disease due to alcohol is the same in all cases: the alcoholic tends to neglect his food and to get gastritis from taking strong liquors on an empty stomach. This leads both to insufficient vitamin B1 (which is necessary to the nervous system) being taken in, and insufficient of what is taken in being absorbed owing to the inflamed condition of the stomach lining. Hence there is neuritis and, in bad cases, damage to the brain cells. But perhaps the main damage is the social one; for, as Clark-Kennedy points out in his book *Human Disease*, "More damage is probably done by (alcohol) in weakening self-control and absorbing income, better spent in other ways, than by any permanent damage to a man's nervous system." As in narcotic addiction, the hunger for alcohol may lead to persistent lying in order to keep up appearances, disregard for family, loss of memory, lack of self-respect and control, loss of work, income, and the rest, in a life where the sole interest is more of the tipple—these are psychological effects imposed on an already unstable personality.

Treatment must ordinarily be carried out in a hospital, and various treatments, such as "Antabuse" or apomorphine, can be given—drugs which make the alcoholic violently sick if he partakes. Other physicians rely mainly on psychotherapy, and some patients are helped by the body known as Alcoholics Anonymous (you will find the address of the local body in your telephone directory). Since the condition is a disease, "will-power" in the case of either alcohol or narcotics rarely has any effect.

The effects of some other drugs are, very briefly:

Morphine leads to detachment from reality, freedom from worry and fear.

Opium. The effects are similar, and results probably least harmful.

Heroin is less likely to make the patient sleepy and more likely to lead to serious addiction—hence the recent move to ban its use altogether, even in medicine.

Cocaine ("Snow"), usually taken in the form of snuff or by injection, relieves temporarily depression, and gives an impression of heightening all physical pleasures. It produces cheerfulness, leads to rapid moral deterioration, and is the most difficult form of addiction to cure.

Marijuana allegedly stimulates sexual fantasies, but certainly decreases sexual ability. It is usually taken in cigarettes, and much nonsense has been talked about it. An official committee promoted by the Mayor of New York found that in large doses marijuana impairs intellectual functioning, causes giggling and laughing (with an inability to do any harm whatever), does not affect the basic personality, and leads to no permanent deterioration. The doped cigarettes are known as "reefers," and the desire of those who use them to be thought "bad boys" leads them to exaggerate the effects of the drug. Thus a well-known jazz conductor announced that "tea (*i.e.*, marijuana) puts a musician in a real masterly sphere. Nothing can mess you up. You hear everything and you hear it right." This belief that reefers help the jazz musician is nonsense; for, regrettably, the truth is that it may *seem* to make the music sound better, but only to the musician; actually, the music is worse.

Barbiturates. Drugs such as phenobarbitone, medinal, veronal, are used in treating nervous illness. Except in excessive doses, there is no evidence that they do any harm at all, and some people take them for most of their lives. Death can result from overdose, but the probability is that those who commit suicide with barbiturates would do so anyhow. One danger, however, is that, after taking the original dose there may be forgetfulness, and an overdose taken which may lead to accidental death. All sedatives and sleeping tablets are best kept in the custody of someone other than the person who takes them, unless the amount is small.

Benzedrene or Amphetamine is a stimulant drug used in the treatment of depression; it is also used to reduce appetite in those who are slimming. In the form of inhalers, amphetamine reduces congestion in the nose. Wrongly used, the drug is taken by those who ought to have more sense in order to give them a "lift." In some people, amphetamine has little or no effect, but those who are worried or tense may well become more agitated with the drug, and large doses can cause complete inability to sleep and great excitement. It is, of course, also used by students before an examination in the belief that it gives confidence and clears the mind; but not even amphetamine can put into, or bring out of, the mind what is not already there.

DISEASES OF THE BLOOD

INTRODUCTION.

The blood-stream is the canal system of the body which carries from one part to the other various substances essential to life. Thus it carries, partly in the red blood cells and partly in solution in the liquid part of the blood, the oxygen breathed into the lungs, and returns to the lungs to be breathed out the waste product known as carbon dioxide. From the intestines it carries the digested foodstuffs through a large system of veins (the portal system) to the liver, where they are changed in many ways to make them suitable for absorption by the cells of the body. The foodstuffs—fats, proteins, and carbohydrates—after change in the liver are discharged into the general circulation and excess amounts are stored for future use. *The liver* is the largest organ in the body, and lies just under the ribs on the right side. In addition to storing food, it also stores unneeded blood, to be given out when emergency calls; it destroys poisonous substances circulating in the blood (not always successfully, of course); it manufactures bile, which passes down the bile duct into the intestines to aid in the digestion of fats; lastly, it manufactures prothrombin, which is necessary to normal blood clotting. More will be said of the liver under the heading of Gastric and Intestinal Diseases.

As we have seen, the blood also carries those defence materials which help to destroy infection in any part of the body: the antitoxins and antibodies, and, of course, the white cells, some of which actively attack germs. Just as the blood

transports food around the body, so it transports the liquid waste matter not needed by the cells to the kidneys, which excrete it in the form of urine.

Blood consists of a liquid part, known as plasma, and floating in this are the red and white cells. A cubic millimetre—that is, an area about the size of a pin's head—of this contains about 5 million red cells, mainly concerned with the transport of oxygen, and about 5,000 white cells, concerned with resistance to infection. There are different types of white cells—for example, the lymphocytes, the leucocytes, and the eosinophils (these are all given various names and subdivided in many ways). The red cells are usually known as erythrocytes. From examination of the blood, doctors can tell a great deal about the patient; thus less than the usual number of red cells signifies anæmia, too many, polycythæmia. If the red cells are reduced in number, but too large, pernicious anæmia is possible; when they are reduced in number but too small, simple anæmia is the probable answer. In acute septic conditions or infections there is great increase in leucocytes—up to 30,000 or more—in some chronic infections or certain diseases, such as whooping cough and glandular fever, there may be increase in lymphocytes. Eosinophils are increased in many allergic diseases.

Doctors also consider such factors as the number of platelets (which are very tiny cells connected with clotting), the fragility of the red cells, and the sedimentation rate, which is the length of time it takes the red cells to sink to the bottom of a tube of blood. The time taken to coagulate is also important.

Two other organs also closely connected with the blood are the *bone-marrow* and the *spleen*. The spleen, on the opposite side of the body from the liver, farther back, and smaller, stores iron and blood. During development before birth, the spleen manufactures both red and white blood cells, but after birth the bone-marrow manufactures all the red cells and most of the white ones. However, all through life the spleen still makes certain types of white cell and has the further function of destroying the old red or white cells and retaining the iron for use in making new red cells. It also kills bacteria which have not been dealt with in other ways. Unlike the liver, the spleen can be removed without danger to life; the liver cannot be removed, and even slight operations on it are dangerous.

Lymph Vessels and Glands.

These have already been mentioned. They carry a milky or clear liquid known as lymph throughout the body. Lymph comes from blood plasma and passes through the glands, which are situated at strategic points. The glands act as a filter for germs, and red lines above an infected area or swollen glands indicate infection which has got beyond the point of entry. The main groups of glands, other than those inside the chest and abdomen, are at the back and sides of the neck, in the armpit, and in the groin. All the lymph vessels meet in the chest, and the main vessel pours the lymph into the blood-stream just above the heart.

The Heart and Blood-vessels.

These will be described elsewhere, and here all that need be said is that blood is oxygenated in the lungs, passes into the heart, and is pumped around the body through the arteries. As they become smaller towards the end of their destination, the arteries are called arterioles, which ultimately become smaller still—the capillaries, which pass into the venules or small veins, thence into the larger veins, and back to the heart with the used blood. In fact, there is more than 100,000 miles of the circulatory system in the body.

Blood diseases can be divided into various general groups: (1) those due to nutritional defects, such as pernicious anæmia, which is caused by lack of the anti-anæmic factor to be discussed later, or the simple anæmia caused by lack of iron and other substances in the food; (2) anæmia due to hæmorrhage or loss of blood in any form; (3) anæmia due to breaking-up of the red cells, as in blackwater fever following malaria; (4) anæmia caused by such damage to the bone-marrow that new blood cells are not produced; (5) a final group of little-understood diseases of the blood cells or lymphatic system. We shall consider these in turn.

NUTRITIONAL DEFICIENCY ANÆMIAS.

Pernicious anaemia is due to lack of something within the body, known as the "intrinsic factor," which is normally secreted by certain glands in the duodenum and at the lower end of the stomach. Together with the "extrinsic factor," taken into the body in protein foods, the two form a substance stored in the liver without which blood formation does not occur. No matter how much of the extrinsic factor is taken in, it is of no avail if the intrinsic factor is not secreted. Why the glands should stop working is not known, but anæmias similar to pernicious anæmia sometimes occur after the stomach has been removed by surgical operation, or during diseases, such as sprue, which damage stomach or intestinal function. However, most cases of pernicious anæmia are not due to these causes—they simply happen. The patient is usually an adult, over the age of thirty-six, who complains of weakness, pallor (of a typically lemon-yellow type), shortness of breath, soreness of the tongue, and swellings of the ankles. The red blood cells are greatly reduced in number, but each cell is larger than normal, and the size of the spleen and liver may be increased. In this disease the stomach does not secrete hydrochloric acid. Formerly this type of anæmia was invariably fatal in a period varying from a few months to one or two years, but in 1924 Dr. Minot of Boston in America began to give raw liver to some seriously ill patients, and found that they recovered. The raw liver supplied the intrinsic factor, and, so, it was found, did dried stomach extract. Nowadays, nobody need die of pernicious anæmia, which is treated with concentrated liver extracts and vitamin B12. If, however, the anæmia has gone on for a long time without treatment, there may be signs of damage to the spinal cord with weakness of the legs and areas of loss of feeling.

Simple Anaemia is due to inadequate diet so far as iron, vitamin C, and other substances are concerned. The red cells are reduced in number, but they are not, as in pernicious anæmia, enlarged. This is the commonest type of anæmia in this country, and is what is usually described as "bloodlessness." Unlike pernicious anæmia, ordinary anæmia is *not* helped by liver extract, and *is* cured by iron tablets. It is important to realise that the fact that people look pale does not prove that they are anæmic. One can tell more effectively by finding pallor on the inner side of the lower eyelid, or by having a blood test taken, but, ordinarily, paleness, breathlessness, and swelling of the ankles denote anæmia. There are so many medicines containing iron on sale that you had better ask your doctor's advice before taking them.

Anaemia after Haemorrhage might seem to refer only to loss of blood after an injury, and so it often is. But in this case unless the blood loss is great it will soon be replaced by the bone-marrow. Perhaps more important, because less obvious, is the simple sort of anæmia caused in women by excessive menstrual loss. This demands treatment of the basic cause by a doctor. Usually in bad wounds blood transfusion is necessary; in chronic loss in women giving iron and preventing the loss is the correct treatment.

Anaemia Due to Breaking-up of the Red Cells is found in many conditions, most of them unknown in Britain. The best-known is blackwater fever, already described, in which the red cells are damaged in malaria and dark blood pigment appears in the urine—hence the name "blackwater." None of them has any importance here, and, in any case, medical advice is necessary.

OTHER DISEASES OF THE BLOOD.

Some blood diseases are due to the inability of the bone-marrow to produce more blood cells. Two important ones are *aplastic anaemia* and *agranulocytosis*. The first may happen without apparent cause, or be produced by X-rays, radium, some antibiotics, and some sulpha drugs—indeed by many drugs; in the long run, it is fatal. Agranulocytosis, if discovered in time, can be cured. The main obvious distinction between the two is the severe ulceration of the throat found in agranulocytosis and not in aplastic anæmia, and, although agranulocytosis can be caused by over-indulgence in certain drugs, it is more usually a sequel to such severe infections as tonsillitis, pneumonia, or septicæmia. Other diseases are due to something which has gone wrong with the production of white blood cells, and chief ones being the leucocytes, which are manufactured in the bone-marrow, and the lymphocytes, made in the bone-marrow and partially in the lymph glands. Disease of these cells, in which they increase vastly in number at the expense of the red cells, is called *leukaemia*, and there are three types.

(1) *Chronic Myeloid Leukaemia*, where disease of the bone-marrow causes decrease in the number of red cells and increase in the number of leucocytes—perhaps to half a million per cubic millimetre (you will recall the normal figure is about 5,000–6,000). The spleen is much enlarged and the patient, commonly a man between twenty-five and forty years, suffers from weakness, swelling of the legs, and bleeding from the nose.

(2) *Chronic Lymphatic Leukaemia* is a similar state of affairs in which the number of red cells is reduced, although less so than in the first case. The spleen is also not so much enlarged, but the lymph glands are, and the number of lymphocytes in the blood is enormously increased. In this disease the patient is usually over middle age, but otherwise the symptoms are much the same as in chronic myeloid leukæmia.

Both diseases are treated by X-rays, and although the ultimate outlook is not good, the patient may have many years of reasonably fair health to look forward to.

Acute Leukaemia is found in younger people, and is usually due to increase—very rapid in this case—in the number of the leucocytes. It is quickly fatal.

A similar condition, in which the *red* blood cells increase in number, is *polycythaemia*. The increase may be from the normal 5 million per cubic millimetre to something like 8 million. The patient has an enlarged liver and spleen, looks blue and congested, and his fingers may become clubbed at the tips. He can lead a fairly normal life for many years with the help of drugs which reduce the production of red cells. However, thrombosis (clotting) may happen at any time, or the bone-marrow may suddenly give out through overwork, so that death is caused by aplastic anæmia.

All these diseases have this in common, that the blood cells of one type or another are produced in excess; they are, in effect, a form of cancer of the blood. Their recent increase may bear some relation to increased radioactivity.

Hodgkin's Disease is another curious condition, very similar in appearance to chronic lymphatic leukæmia. Here, however, most cases appear in young people, and, although the lymph glands enlarge, there is relatively little change in the blood. There is, too, likely to be an intermittent temperature which goes up and down at intervals of about ten days. Finally, all the glands of the body (within the chest and abdomen, as well as in the more superficial areas) become enlarged and may interfere with eating, speaking, or breathing. In the later stages severe anæmia develops, but, as we have already seen, there is little to note in this respect to begin with. Hodgkin's disease is, in fact, a disease of the lymph glands rather than of the blood. The outlook is always serious, but X-rays and certain drugs are helpful in slowing down the process.

Purpura is one of quite a number of conditions in which there are hæmorrhages under the skin, usually resembling small purple spots. Often such spots are not a disease in themselves, but simply the result of some other condition. For example, many of the ordinary fevers, septic conditions, leukæmia, jaundice, and the later stages of cancer or kidney disease may bring about this type of purpura, known as secondary because of the reason given above. Purpura may also occur after epileptic fits or bouts of whooping cough due to the strain of the spasms, and following the use of certain drugs.

Primary purpura, which is the genuine article, includes a group of diseases, some serious, others mild, and the main members of this group are:

Purpura Simplex, a mild condition in children associated with small hæmorrhages into the skin of the shins, sometimes diarrhœa, fever, general "run-down" feeling, and muscle pains. It may sometimes be connected with deficiency of vitamin P, but clears up in two to three weeks.

Purpura Haemorrhagica or Thrombocytopenic Purpura is much more serious, although in some respects its symptoms are merely an exaggeration of the above. It is found in children and young women; the hæmorrhages are severe and occur not only under the skin but also from the gums, nose, and bowels, so that anæmia soon develops. There is high fever, often with delirium. Unlike purpura simplex, in which the blood is unchanged, this disease is caused by some defect in the spleen which continues to destroy the blood platelets which play a part in clotting. Blood transfusions are given, but if the condition becomes serious the spleen may have to be removed.

Henoch's Purpura: this is a disease usually associated with infants and children. Blood and mucus are secreted into the intestine, there is colic, vomiting and diarrhœa containing blood. The main importance of this disease is that it so closely resembles a number of abdominal conditions for which surgery is necessary that it may be referred to a surgeon. The fact that it is a form of purpura becomes evident when the tell-tale spots appear on the skin. An attack clears up in about two days, but may recur and become dangerous.

Haemophilia—Bleeding and Clotting. As is well known, there are some people whose blood fails to clot in the normal time when a wound occurs. When this is so, even a small wound may cause the patient to bleed to death—a tooth extraction, a slight cut, a bruise, all become major emergencies. Since these minor injuries are happening to most of us many times each year, the life of a hæmophiliac is a risky one. Many hæmophiliacs, indeed, in their early twenties, have been given as many as two hundred blood transfusions to save their lives in injuries which would have been unimportant to anyone else.

Hæmophilia is hereditary, and is passed on to the male members of a family by the mother who is not a "bleeder," but whose father was. The mother is the carrier who hands on the disease to her sons. Perhaps the most famous example was Queen Victoria, who had four sons and five daughters; one son (Prince Leopold) died of the disease, and two daughters (Princess Alice and Princess Beatrice) became carriers. Princess Beatrice married and produced two sons with hæmophilia and one carrier daughter—a daughter who married King Alfonso of Spain, and out of four sons two had hæmophilia. Prince Alice married Prince Louis of Hesse, and had one son, who died of bleeding in his fourth year, and two carrier daughters, one of whom became the Czarina of Russia. Her only son was the unfortunate little boy who, by reason of his hæmophilia, was the main reason for the introduction of the self-styled "healer" Rasputin into the family and the source of his malign influence over the royal house.

Hæmophilia is only one disease in which there is a tendency to bleed, in this case caused by delayed clotting. But a similar tendency may be caused by inadequate clotting, when the clot formed over a wound is soft, jelly-like, and fails to harden, or, as in the case of some types of purpura, when the capillaries are so fragile that they are easily broken by a relatively slight injury. What

are the factors which bring about clotting? When bleeding occurs, the platelets in the blood-stream move to the area, disintegrate, and release a substance known as thromboplastin, which, together with two other substances in the blood—calcium and prothrombin—form thrombin. (The prothrombin is manufactured in the liver, and vitamin K is an essential in its formation.) Thrombin, however, is not the final product; for it interacts with something else in the blood, known as fibrinogen, to form *fibrin*, the actual clot, and, as we have seen, the fibrin forms long, thread-like fibres which fill in the gap and ultimately draw the edges of the wound together. Clearly, then, the tendency to bleeding may result from lack of any one of these substances; most often from lack of prothrombin (due to liver disease, blocking of the bile-duct, or lack of vitamin K) and very rarely from calcium deficiency. Almost equally rare is deficiency of fibrinogen, so the remaining types are caused by lack of thromboplastin, either because the number of platelets is reduced, the amount of thromboplastin in the platelets is insufficient, or, most commonly, because the platelets are so tough that they fail to break up at the site of the bleeding.

There are many different treatments used in bleeding diseases, and obviously the treatment will depend on what specifically is missing. But, in any case, the outlook is much better than it once was.

BLOOD TRANSFUSION.

When, in the early seventeenth century, William Harvey discovered the fact of the circulation of the blood, he became the predecessor of many great men in the England of his time; England was in the process of a scientific renaissance, one expression of which was the formation of the Royal Society under the patronage of Charles II—a society with such members as Sir Christopher Wren, Robert Hooke, the greatest microscopist of his time, Boyle the physicist, Sir Isaac Newton, Pepys, and others. All these men had an insatiable curiosity which extended far beyond the bounds of their particular subject, and thus it was Wren the architect who first suggested the possibility of intravenous injection of drugs (*i.e.*, injecting them directly through a syringe into a vein), and who carried out with other members the first experiments on blood transfusion. They transfused blood from one dog to another, from a sheep to a man, and from a young man to an old man—the fact that no human fatalities seem to have occurred points more to luck than good guidance, since, as we now know, there are four well-defined types of human blood, and some types are so incompatible that mixing will cause acute distress and possibly death. Before transfusion, therefore, it is necessary to know that the blood types of both donor and recipient are compatible.

Blood transfusion is much more frequently used now than formerly, as knowledge of the technique has increased. Whereas it was at one time regarded almost as a last resort, it is now used before, during, and after surgical operations if necessary. Blood transfusion, in fact, has become the most important weapon in the prevention and treatment of shock and has saved millions of lives. The blood taken from donors is stored in "banks" according to type, but when whole blood is not available plasma (usually in the form of dried powder which, like powdered soups, can be "reconstituted" with sterile water) or intravenous saline is also useful.

DISEASES OF THE HEART AND BLOOD-VESSELS

DISEASES OF THE HEART.

The heart lies in the centre of the chest and slightly to the left side between the lungs. Its shape is familiar from the hearts seen in butcher's shops, or, if you are a vegetarian, from the hearts on playing-cards (which are, however, a somewhat idealised version). There are four chambers in the heart, the right and left auricles and the right and left ventricles, the auricles being the ones at the upper part, the ventricles the ones below. The chambers are separated by valves which permit only a one-way flow of blood.

Circulation of the blood is, of course, continuous, and does not begin anywhere, but for purposes of description we may conveniently begin at the left ventricle, which pumps the blood through the aortic valve into the aorta, the largest artery in the body, and thence throughout all the other arteries. After passing to the arterioles (the smallest arteries), and to the capillaries, where the blood does its work of supplying oxygen and food to the tissues, it passes into the small veins or venules and then to larger and larger veins until, having given up its oxygen and food and absorbed waste products such as carbon dioxide (breathed out in the lungs) and soluble food wastes which are filtered out by the kidneys, it passes into the largest vein, the *vena cava*. The *vena cava* enters the right auricle, which pumps the blood through the tricuspid valve into the right ventricle, from which it passes through the lungs to get rid of its carbon dioxide and take in more oxygen. From the lungs, the blood goes to the left auricle, and thence, through the mitral valve, to the left ventricle to begin the cycle once more. The tricuspid valve, as the name implies, has three cusps or flaps; the mitral valve, shaped like a bishop's mitre, has only two.

Like other internal organs, the heart is covered in a thin, double, transparent covering or sac, rather like the plastic bags in which food is sold, and this contains a layer of fluid to prevent friction as the pumping motion is carried on; it is known as the pericardium.

There are three different tissues in the heart: the pericardium, which has just been described; the myocardium, or muscle, which forms the main bulk; and the endocardium or lining of the chambers, including the valves. Any one of these tissues may be attacked by disease, as also may the small blood-vessels, known as the coronary vessels, which supply blood to the heart muscle (for the heart, no less than any other part of the body, has to have a blood supply).

In general, heart disease belongs to one or other of three types: *congenital*, due to defects of the heart at birth; *infective*, due either to actual infection or its after-effects; *degenerative*, due to the changes of old age—which come on at different ages, depending on the individual. Now, strictly speaking, heart diseases are not curable in the sense that in most cases we cannot say that the heart has returned to its previous condition. What we can say is that the heart has a great ability to compensate for its defects, both by natural processes and with the aid of modern medicine and surgery. Only a score of years ago people were turned down for Life Insurance because they had a "murmur" in the heart (*i.e.*, the sound a doctor hears with his stethoscope if a valve is defective). But today judgement is based on much wider information; for it is realised that what is heard through a stethoscope is not in itself justification for making a hard-and-fast diagnosis. We must consider also the results given by electrocardiograms and, above all, by the individual patient's performance and symptoms.

The electrocardiograph is an instrument which measures the electrical currents passing through the heart muscle as it beats and shows them up on a chart. It gives in this way a pretty accurate estimate of the heart's efficiency. But, important as these results are, we are much more interested in the actual observation of what the heart can *do*, how it in fact *works*.

The following story—which is true—gives an indication of the modern medical attitude towards heart disease: A wealthy patient, who believed something to be wrong with his heart, made an appointment with a famous heart specialist. On reaching the hospital, he found that the doctor's office was on the third floor, and that the lift was not working. He was therefore compelled to walk up three flights of stairs, and finally knocked on the door of the specialist's office. When the door was opened the doctor looked at him and asked: "You walked up the stairs because the lift is broken?" "Yes," replied the patient. "Then your heart is perfectly normal. Good afternoon!" said the doctor.

What this story illustrates is that, generally speaking, the basic criterion of the heart's efficiency is whether it works satisfactorily. It is rarely possible to have heart disease in the presence of the ability to lead a normal life, except in the case of such conditions as coronary thrombosis or angina pectoris, which may remain undiscovered even by the most refined methods of investigation until they are upon us. In conclusion, it should be noted that symptoms related to the heart in an obvious manner, such as pain, discomfort, or palpitation, are rarely signs of heart disease, and are more likely to be nervous in origin or due to indigestion, fibrositis, pleurisy, or other causes.

Pericarditis is to the heart what pleurisy is to the lungs—an inflammation of the covering layer. The vast majority of cases result from acute rheumatism, but they can also be associated with other fevers, septicæmia, and generalised tuberculosis. Pericarditis may be an extension from local disease, such as pneumonia, pleurisy, or chest wounds.

When this happens inflammation develops between the two layers of the pericardium, so that instead of moving smoothly against each other when the heart beats they "scrape." If acute rheumatism is already present the temperature increases, there is pain over the heart, difficulty in breathing and restlessness, and the pulse rate goes up. This condition is known as "dry" pericarditis, but may develop into pericarditis with effusion in which fluid is secreted between the layers; when this happens, the pain disappears but breathlessness increases. The treatment of both types is that of the condition causing them (*e.g.*, rheumatic or scarlet fever), rest, and, if fluid is formed, it may have to be drawn off. Ordinarily the outlook is good, but adhesions between the pericardium and surrounding structures may occasionally give trouble.

Myocarditis, or disease of the heart muscle, results from a number of causes: first of all there is the great enemy rheumatic fever, and in a lesser degree diphtheria, typhoid, and chronic syphilis—all these infections poison and weaken the heart in varying degrees. Or the muscle may degenerate in pernicious anæmia, hyperthyroidism poisoning from phosphorus and other substances, or when the blood supply is affected, as in coronary thrombosis. In some cases of myocarditis damage is slight and gradual in onset, in others—such as after coronary thrombosis—it may be sudden and severe. The result in mild cases will be *compensation* when the heart is able to overcome its defects, but in severe cases *heart failure* may develop. This applies, too, to the later results of valvular disease of the heart, in which, again, there may be compensation or failure.

The condition of the heart muscle is the main factor in determining the ability of the heart to overcome any sort of damage; for it is the muscle which does the compensating. Thus, when one of the valves becomes narrowed by disease the muscle in the chamber below increases in size and thickness to force the blood through, but when the myocardium itself is degenerated this cannot take place, and sooner or later heart failure of varying degrees occurs. By and large, the symptoms of heart failure are those of most heart diseases: breathlessness (at first on mild exertion, later even when lying down), occasional coughing up of small amounts of blood, swelling of the feet (which in the later stages may extend upwards), and cyanosis—blueness of the skin. Obviously, the treatment is a matter for the doctor, who will prescribe drugs suitable to the exact condition, rest in bed, and other measures.

One of the main causes of myocarditis, as we have seen, is coronary artery thrombosis—that is to say, clotting of blood in one of the small arteries supplying the heart muscle.

Coronary Thrombosis is interesting in that: (*a*) it occurs mostly in men over forty-five; (*b*) it is more frequent in industrialised countries; and (*c*) it is more frequent in the wealthier classes. These facts have been used to support two separate theories as to its cause: first, that it is due to long periods of emotional stress in the ambitious, striving type of personality, and secondly, that it is due to over-indulgence in animal fats (not vegetable or fish oils), which causes the laying down of a substance known as cholesterol in the coronary vessels and their ultimate closure. Coronary thrombosis, then, is regarded according to one's viewpoint as an emotional or a dietary problem, but both schools of thought realise that some predisposition lies behind whatever the immediate cause may happen to be.

There is certainly some support for the view that animal fats, including milk, may play some part in predisposed individuals in bringing about coronary thrombosis. For example, the incidence of the disease went down during the War in Norway when meat was rationed; it is uncommon amongst fish-eating people, such as the Eskimos, or those who eat little meat—because they cannot afford it—such as the peasants of Southern Italy. But, of course, the "stress" school of thought can point out that these peoples are not, on the whole, subjected to the strains of a highly competitive society. High living and a tense emotional life often (if not always) tend to go together, and it is quite possible that both theories of the causation of coronary thrombosis are true: that emotional stress is the predisposing factor which disturbs the workings of the body and makes animal fats dangerous to the individual.

Thrombosis occurs when the building-up of cholesterol derived from such fats suddenly leads to clotting in one or other of the coronary arteries so that the blood cannot get through. The result is immediate and severe pain over the heart, which lasts for several days; there is breathlessness and shock, sweating, rapid and weak pulse, and later low fever. In about half the number of cases death occurs immediately, but in those who recover from the attack the outlook is reasonably good. The treatment is, naturally, a matter for the doctor, but will include rest in bed for six to eight weeks, a gradual resumption of work, depending on the state of the heart, reducing if overweight, and possibly dietary restrictions. Drugs are used to strengthen the heart.

Thrombosis in other parts of the body will be discussed later, but here it may be of interest to mention the anti-coagulant drugs which have the effect of preventing clotting. They are chemicals which have been known in Nature for a long time. Thus a leech, in order to liquefy the blood it sucks from its victim, secretes "hirudin," which prevents clotting, and the livers of dogs and oxen contain "heparin," which has a similar effect. But the greatest advance in this field came from the study of a bleeding disease in cattle, often ending fatally, which had long been familiar to veterinary surgeons. In 1921 Schofield of Canada found that the cause of this disease was the eating of spoiled sweet-clover, and in 1941 the chemical responsible for the bleeding was isolated from clover by Link in America. It is found in sweet-clover which has been spoiled by storage as hay, and is known as "dicoumarin." If given in large amounts dicoumarin produces symptoms identical with those of the bleeding diseases: purpuric spots and hæmorrhage from the gums and internal organs. It is obviously the ideal drug for dealing with diseases in which clotting takes place too readily—coronary thrombosis, phlebitis, and pulmonary embolism. Dicoumarin, however, has to be used with care and under medical supervision.

Angina Pectoris. A disease which is in many respects similar to coronary thrombosis is *angina pectoris*, but here, although the arteries may be narrowed, the immediate cause of an attack is spasm of the blood-vessels, which are therefore only temporarily closed. The symptoms are the same as in coronary disease except that the pain over the heart (which frequently passes up the neck or down the inner side of the left arm) is: (*a*) brought on by exercise, whereas thrombosis can occur whilst resting; and (*b*) wears off in a comparatively short time—usually after the exertion ceases. Death may occur during an attack, but medical care can do a great deal when the condition is discovered in time. Drugs are given which prevent spasm (usually nitroglycerine, known in a more sinister sphere as T.N.T. the explosive). During an attack, relief is obtained from amyl nitrite, which is inhaled

from a capsule. Otherwise, the treatment is as for coronary thrombosis.

Valvular Disease of the Heart, or endocarditis, has a rather frightening sound which is not always justified in view of the heart's ability to compensate. The main enemy of the heart is acute rheumatism and streptococcal infections generally (scarlet fever, tonsillitis), and other conditions predisposing to endocarditis have been mentioned. Curiously enough, rheumatic fever is now a rather rare disease, although this may not be so strange when we consider the statement in a pre-war text-book that it is "relatively an uncommon disease amongst the well-to-do, and evidence is being brought forward that overcrowding in damp houses is the biggest factor of all." Higher standards of living and the much-abused Welfare State have, there can be little doubt, brought about this result.

The valves of the heart are the pulmonary, the tricuspid, the mitral, and the aortic, and each valve may be damaged in one of two ways—by narrowing, so that the blood cannot easily be forced through, or by leaking, so that the blood pumped through slips back again. The first is known as stenosis, the second as regurgitation, and when one or more of the valves are damaged in either way the heart, as we have seen, first tries to compensate. For example, in incompetence of the aortic valve between the left ventricle and the aorta, the blood is pumped out, but since the valve cannot close properly, some of it slips back into the ventricle. In order to deal with this problem, the ventricle becomes greatly enlarged, but, if this action fails, the increased pressure in a chamber which is unable to empty itself completely is passed back through the rest of the circulation. The left auricle overfills, the lungs become congested, and finally the right side of the heart is affected, ultimately leading to varying degrees of heart failure.

Since rheumatic fever is no longer so common as it once was, and diphtheria and chronic syphilis are equally rare, the most usual sequence of events today is as follows: a child or young adult develops a streptococcal sore throat, which may simply clear up without more ado, as it does in the vast majority of cases. But sometimes the infection is followed within about ten days by pains moving from one joint to another, and this, too, clears up shortly. A similar episode may follow at a later date, and, still later, it may be found that these apparently unimportant events have damaged the heart; the damage may be discovered accidentally at a routine medical examination or because the patient complains of breathlessness or some other symptom.

This, rather than the more dramatic form which was once so common, is the way that, in these times, rheumatic disease manifests itself. It has long been known that rheumatic fever was associated with streptococcal sore throat, but it is now clear that acute rheumatism is not a simple infection; for streptococci are never found in the heart or in the joints. Apparently, it is a condition in which the individual has become allergic to the toxins of the streptococcus, which then damage the joints, the heart muscle, and the valves.

Irregularities of the Heart-beat.

Like other muscles in the body, the heart cannot move without messages being passed to it from the nerves, but the nerves supplying it belong to the automatic nervous system. The vagus nerve, belonging to the parasympathetic system, slows the beats, and the sympathetic nerves quicken them. Both these groups of nerves meet at the point where the great veins enter the heart at the right auricle, and this point is known as the pacemaker; from there, they send impulses around the auricles and meet again at the auriculo-ventricular bundle at the junction of auricles and ventricles; lastly, they pass down between the ventricles, dividing into two bundles to supply both sides. Obviously, any sort of irregularity can arise: (*a*) in the lower centres of the brain, where the impulses originate; (*b*) at the pacemaker; (*c*) at the junction of auricles and ventricles.

Tachycardia means that the heart beats too rapidly, and this it does in many circumstances: after exercise, when emotionally excited, in fever when the temperature is raised, in chronic infections, or in anæmia. Rapid heart-beat is also found in thyroid disease. However, there can be little doubt that attacks of palpitation, as contrasted with prolonged rapid pulse, are nearly always due to emotional causes. Palpitation *can* be a symptom of heart disease, but most usually it is a sign of "nerves"; in the absence of other signs of heart disease such attacks can be assumed to be due to over-stimulation of the nervous centres in the brain which are concerned both with the emotions and control of the heart. An example of emotionally caused illness in a normal enough heart is what used to be called "*D.A.H.*" (*i.e.*, "disordered action of the heart") during the First World War and "*Effort syndrome*" during the Second. The commonest symptoms are breathlessness, palpitation, nervousness, dizziness, and pain over the heart—all the symptoms that would suggest heart disease to the layman. It is, in fact, a neurosis, pure and simple, and the abnormal impulses which cause the symptoms arise in the lower centres of the brain as the result of emotional tension.

When the irregularity arises at the pacemaker or in the auricles there may occur the not uncommon phenomenon of feeling the heart stop for a moment which is described medically as an *extra-systole*. They are commonly associated with disease of the myocardium in middle age, or, less frequently, in young adults, when they are (rather dubiously) asserted to be due to over-smoking. However, the most serious disease of this type is *auricular fibrillation*, in which so many impulses pass down through the auricles that they beat rapidly and irregularly and the ventricles respond to the shower of messages as best they may. Auricular fibrillation is usually a sequel to mitral stenosis, but can also result from hyperthyroidism and myocarditis. There is palpitation, rapid and completely irregular pulse (140–180 to the minute), and, ultimately, signs of heart failure. The treatment is with such drugs as digitalis and its derivatives or quinidine, which is a derivative of quinine. *Digitalis* is a drug, known for many years, obtained from the purple foxglove when the leaves are dried and powdered; it has the double effect of slowing the heart beat by acting on the brain centres, and strengthening the contraction of the muscle by direct action. *Stropanthin* acts in a similar way. Although digitalis and stropanthin are the main drugs used in heart disease, doctors are nowadays much more selective in using them; for it is evident that they are not helpful in all heart conditions. In fact, their main use is in auricular fibillation and congestive heart failure—in other conditions they do little good.

In *heart block* the trouble arises at the junction of the auricles and ventricles because the nerves which pass on the impulse have been damaged by one or other of the conditions described under the heading of myocarditis. When the block is complete the ventricles beat entirely independently of the auricles at a rate of about 30–40, and occasionally there are attacks in which the ventricles either cease beating for a few seconds or beat very slowly. This may be associated with attacks somewhat resembling epilepsy, known as the Stokes–Adams' syndrome. In partial heart block the ventricle misses a beat entirely—often every third or fourth beat. The treatment for both conditions is a matter for the specialist: digitalis is *not* used.

The Blood-pressure.

There are two types of raised blood-pressure, the type known as secondary hypertension (hyperpiesis), which is due to a number of diseases such as kidney disease and diseases of the glands, blood disorders such as polycythæmia, and hardening of the arteries, and the type known as primary or essential hypertension (hyperpiesia), which is not the result of illness elsewhere. In the treatment of secondary hypertension the doctor's attention will naturally be directed to the disease causing the raised

pressure, but essential hypertension, although it is extremely common, is not so easily dealt with. Its immediate cause appears to be a spasm of the arterioles, or small arteries, throughout the body. At first this is periodic, but later becomes permanent, with the result that the pressure remains raised. At one time it was supposed that such factors as septic areas in the body, tobacco, and a too rich diet played some part, but now it is fairly clear that essential hypertension is the result of two main factors: heredity and stress. What part each of the factors plays is unknown; for, although it is often found that relatives of the patient have suffered from the condition, this by no means proves that heredity is the cause. Obviously, someone brought up in a certain kind of mental environment will tend to adopt similar attitudes to those of his relatives, heredity or no heredity. Stress, then, is the most important factor in the sort of high blood-pressure which is not the result of another disease, but "stress" does not simply mean anxiety or fear (which, after all, have been common to most human beings throughout the centuries), and if anxiety in itself had the power to cause illness we should be in an even worse state than we are now. It seems that what matters is "bottled-up" emotional tension—worrying inwardly, which is quite consistent with not being at all consciously upset. In short, heredity may supply the sort of temperament which is prone to worry, but events cause the worry itself. The treatment of essential hypertension depends on its severity; in some cases drugs will help (for example, rauwolfia or "Serpasil" and some more powerful agents), but in others an operation which divides the nerves causing the spasm is necessary. Sedatives may also be used, but there is little evidence that dietary or other factors play any important part in essential hypertension.

Most people seem to believe that certain symptoms almost infallibly suggest the existence of high-blood pressure, but in point of fact there is no reason to suppose that any of these symptoms—headaches, giddiness, noises in the ears, lack of concentration or poor memory—indicate any specific condition, least of all high blood-pressure. Nor is it true that patients tend to be the broad, muscular, red-faced type they are so often imagined to be. By and large, hypertension is discovered largely by accident, and the sufferers are just as likely to be small, thin, and pale, as large, fat, and ruby-complexioned.

Low blood-pressure is not a disease at all, although like normal or high blood-pressure it may be found in association with other diseases. No treatment for low blood-pressure in itself is necessary.

DISEASES OF THE BLOOD-VESSELS.

Arteriosclerosis or "hardening of the arteries" is one of the commonest diseases. The aorta and the main blood-vessels become narrowed by the deposition of cholesterin, and the result is most evident in the coronary arteries supplying the heart muscle or in the arteries supplying the brain. The first may lead to degeneration of the heart muscle, the second to such symptoms as forgetfulness, confusion, and dizziness. Arteriosclerosis, like coronary thrombosis, may be due to stress, or, more probably, to a diet over-rich in cholesterol in those already predisposed by heredity. Arteriosclerotic changes happen to most people as they grow older, but not necessarily to a degree that makes them noticeable. The treatment is to regulate the diet, and lead a quiet, steady life.

Thromboangeitis Obliterans, or Bürger's disease, is a rather uncommon disease in which there is spasm of the blood-vessels and perhaps clotting which may lead to gangrene. It begins with cramp in the legs brought on by exercise, ceasing when the legs are rested, but afterwards there develops redness and a shiny appearance of the feet as the vessels become entirely blocked. The pain becomes severe and continuous, and may prevent sleep.

The disease appears to be due to an allergy to tobacco, and the patients are always heavy cigarette smokers. Treatment is rest in bed, and smoking should be given up; in severe cases it may be necessary to operate on the nerves causing the spasm, or, if gangrene has supervened, to amputate the affected part.

Extreme cold, as we have seen, can affect the tissues in the form of frostbite. But some people are particularly sensitive to even mild degrees of cold and suffer in winter from *chilblains*, which, although often described under the heading of skin diseases, are really connected with the circulation. People with chilblains should take plenty of nourishing food and wear woollen socks and woollen gloves in cold weather. Sometimes vitamin K, "Pernivite," or nicotinic acid have proved helpful.

In *Raynaud's disease* the response to cold is more dramatic, and the hands or feet become dead white during attacks. In a severe case the fingers, particularly, may later become blue or black, with severe pain or even gangrene. Occasionally the ears and nose are affected. Drugs may help, or it may be necessary, as in thromboangeitis obliterans, to cut the nerves producing the spasm. Persistent exposure to cold and damp leads to circulatory trouble in anyone, and *trench foot* was common during the First World War; its counterpart in the Second World War was "*immersion foot*" in men who had been drifting for weeks in open boats with their feet in bilge-water. Frostbite, trench foot, and immersion foot are more or less normal reactions to extreme cold; chilblains and Raynaud's disease occur only in those who are specially sensitive to cold, whose blood-vessels under its influence readily go into spasm.

Aneurism happens when the muscular lining of an artery becomes weakened and then the outer lining "blows out" like a balloon, forming a large swelling on the side of the vessel. This may be caused by injury, or strain, or arteriosclerosis, but in 95 per cent. of cases is due to syphilitic disease. Aneurism used to be very common, but is now rather unusual. It is treated by drugs or by operation.

Embolism and Thrombosis are closely associated with each other; for a thrombosis occurs when the blood in a vessel clots, and, if the clot is set free to pass through the system until it finally blocks some part of it, it is described as an embolus. This clotting ordinarily occurs when the blood flows over injured tissues, but may also occur when the inside lining of the blood-vessels have degenerated, or after an operation when the patient is lying in bed for a long period and the circulation is abnormally slow. It can also occur in cases of infection in a vein, which is known as *phlebitis*. If the clot stays in the original position, the blood-vessel is closed, and in the limbs there will be swelling due to the pressure in the vein beyond (obviously the degree of upset will depend upon the size and importance of the blocked vein—in the brain it may have serious effects in even quite a small vessel, in the leg, the blocking of a small vessel might not cause much trouble). However, if the blood clots in one of the large veins of the leg after an operation the result may be a *pulmonary embolism*, when the clot separates itself and passes through the blood-stream to the right auricle, and thence to the pulmonary artery, which it blocks, causing sudden death in someone who appeared to be getting on quite well. Nowadays this danger is much reduced by getting patients out of bed as soon as possible after a major operation.

When you think about it, you will realise that, although the heart can fairly easily pump blood down to the legs, it is not so simple for the blood to return. Having passed through the capillaries it is not just pushed back up the veins by the pressure from the heart—on the contrary, it has to be *massaged* upwards by the leg muscles during exercise. To avoid the blood falling back, the veins are provided with valves somewhat like those in the heart, which prevent the backward flow. Now, especially in people who have jobs involving long hours of standing or in women who have had a number of pregnancies, the congestion produced makes it even more difficult for the valves to operate effectively, especially if they are already not too competent, and *varicose veins* may develop.

In the early stages an elastic bandage or stocking may help, but, later, injections to produce clotting in the superficial veins, or an operation involving tying the main superficial vein at the inside of the thigh, may be necessary. *Varicose ulcer* is prone to develop just above the ankle because of the failure of the tissues to get a proper blood-supply. Apart from the measures already mentioned, it is important that people with varicose veins should stand as little as possible and should rest with their feet raised; this is much more important than ointments and bandages.

HEART SURGERY.

Only about sixty years ago an eminent British surgeon stated that "surgery of the heart has probably reached the limits set by Nature to all surgery; no new method and no new discovery can overcome the natural difficulties that attend a wound of the heart." He was, however, wrong; for new methods have made it possible to operate even within the chambers of the heart. Here it is only possible to describe briefly some of the processes which can be carried out. In stenosis, or narrowing of a valve, the heart can be opened and the valve stretched, or, if the valve is leaky, it can be replaced by an additional valve, a plastic ball covered with silicone rubber which stops the back-flow when the heart relaxes. Coronary thrombosis, too, can be dealt with either by scraping out the diseased lining of the arteries or by restoring the blood-flow from somewhere else by attaching to the heart a piece of tissue from the chest wall.

Of course, some of these operations are only in the experimental state, but they are perhaps of greatest interest in the case of blue babies—those children born with heart defects which, because the blood does not get properly oxygenated, cause them to appear blue or cyanosed, as a doctor would say. Such a child may be born with the main blood-vessels turned the wrong way round, with a hole connecting the two auricles or the two ventricles, with a narrowed pulmonary valve, or with other defects which greatly shorten the expectation of life. It is in such disease that surgery has proved most successful.

Some operations can be done without opening up the heart itself, but if this becomes necessary a serious problem arises; for if the circulation is interfered with for more than four minutes the brain (which is the most delicate organ of the body) suffers irreparable damage. The problem was partially solved by C. H. Bailey in the United States, when, knowing that if the body temperature is lowered the tissues need less blood, he conceived the idea of freezing the patient in a bath packed with ice. In this way the normal body temperature of 98·4° was reduced to 75°, which gave him exactly double the time—eight minutes—to carry out his operation. But eight minutes is not enough for all heart surgery, and other techniques have had to be devised to solve the problem of how to make the blood circulate whilst the heart is not working.

One method used with blue babies was the rather dangerous method of connecting the child's circulatory system with that of someone else (usually the father), so that whilst the child's heart was out of action the donor's heart and lungs took over. But such solutions are no longer necessary because, largely in America, machines have been devised which draw the blood from the heart, pass it through an artificial lung so that it becomes oxygenated, and return it to the body whilst an operation on the heart is carried out. The difficulty of devising such a machine was primarily that the blood must be oxygenated without any bubbles getting into it; for if this occurs one of the bubbles may get into the circulation and, passing to the brain, act as an embolus causing death or paralysis in the same way as a blood-clot. So the earliest type of machine drew the blood from the heart and passed it over a series of thin plates in chambers containing oxygen, but it has since been found that oxygen can be bubbled through the blood in the machine, the mixture allowed to settle, and any excess bubbles removed by passing through a reservoir coated with a substance long used by brewers for removing froth in the manufacture of beer.

Here is a summary of some facts people may wish to know about heart surgery.

The operations are dangerous, but new methods are making them safer. They are not carried out unless the existing condition creates more risk than the operation, and the death-rates of the more important operations are as follows: blue-baby operations, 20–25 per cent.; coronary artery disease, 10–15 per cent.; narrowing of valve, 5–10 per cent.

Needless to say, only a small number of patients with heart disease ever need surgical treatment, and in fact there are not many people of over forty who do not have "heart trouble" in some degree or another. Those who are operated on successfully are improved to a considerable extent, but this does not mean to say that they can afterwards lead a perfectly normal life; they will live longer if they take reasonable precautions. Operations on blue babies are ordinarily carried out because the patient would not survive without the operation, but surgical treatment of coronary disease, and valvular stenosis or incompetence, is still in the experimental stage; it is only carried out in fairly exceptional cases.

DISEASES OF THE RESPIRATORY SYSTEM

INTRODUCTION.

The respiratory system is concerned with taking into the body the oxygen which is necessary to life and getting rid of the carbon dioxide which is a waste product. It begins at the nose, which is intended (although not always used, since there are many mouth-breathers) as a filter and air-conditioner. The hairs in the nose keep—or are intended to keep—dust particles from the throat, and its sticky lining, warmed by the blood-vessels in which it is so rich, has the double function of removing the finer dust and germs and warming the air taken in.

After this process, the air passes down from the back of the nose to the space behind the mouth and then down the windpipe or trachea into the lungs. On the way it goes through the larynx or voice-box (above the trachea), which makes speech possible with its mechanism of vocal cords; the vocal cords separate during breathing in order to let the air through. Lastly, in the chest the windpipe divides to right and left and goes into the lungs; these main divisions are the bronchi, and within the lungs they subdivide, rather like the arterial system, into smaller and smaller tubes, known as bronchioles, which end up by entering the air-spaces of the lung tissue. There, in the thin, spongy spaces lined with blood-vessels, the breathed-in air gives up its oxygen to the blood.

The two lungs, right and left, lie within the chest attached to the bronchial tubes and the large blood-vessels. These are their "roots." They are, like the heart, covered with a double layer of thin, plastic-like material, the pleura (the part which is affected in pleurisy), and they contract and expand with the movements of breathing. But breathing is not carried out by the lungs themselves—it happens when the muscles between the ribs draw the ribs up and so expand the space within the chest that air is sucked in. Normally the pressure within the chest is less than that of the air outside, so that if the chest is punctured the lung collapses. This is important both in chest surgery and in certain conditions where, as we shall see later, it is desirable to collapse the lung in order to rest it. The left lung is divided into two portions or lobes, the right into three.

When one thinks of the nose, certainly if one thinks of it in medical terms, the first disease that comes to mind is the *common cold*, about which we know so much and yet so little. Colds are a virus infection which, even if trivial, cause considerable discomfort and much wasted time; but research seems to show that a great deal depends upon the type of person in whom the virus arrives. Thus people sent out in thin sports clothes to run for long distances in the rain and then made to rest in their wet apparel showed no special liability to catch cold, but it seems possible

that sudden changes of temperature may have some effect. For example, in America, where central heating in some areas is very hot and the weather outside may be very cold, nose infections are common.

Even more perplexing, however, is the fact that, like the judges we read of in the daily papers, we often have to ask: "What *is* a cold?" Everyone who has a running nose or even a temperature is not necessarily suffering from coryza, the scientific name for the common cold; they may have *allergic rhinitis*, similar to hay fever, which has no connection at all with infection. In this case the symptoms are produced by dust, pollen, or some other material to which the person is sensitive. Nasal discharge and temperature may also be brought about by *sinusitis*—that is to say, an infection of the spaces within the bone of the skull which communicate by small openings with the inside of the nose. These are the frontal sinuses just behind the eyebrows, the maxillary sinuses below the eyes, the ethmoid sinuses in the corner of the eyes on either side of the nose, and the more deep-seated sphenoid sinus right at the back of the nose. When these cavities are infected pus forms and naturally discharges into the nose, but if the lining of the nose swells up (as it does, for example, in a hot room) the openings into the nose may be blocked, the pus accumulates, and there is severe pain over the site of the sinus. Sinusitis may respond to the sulpha drugs or to antibiotics, but it is sometimes necessary to make a new opening into the nose and wash them out or to operate.

Whenever anything goes wrong with the nose, whether it be a virus infection an allergic irritation, or discharge from the sinuses, there is always a secondary invasion by germs which are the result rather than the cause of the trouble; the thick pus which comes from the nose in the later stages of a "cold" is largely due to them. There are no injections or inoculations against colds, but conceivably *some* of the many available may prevent colds getting worse by dealing with the secondary invaders; they certainly do not deal with the original cause, the virus. Capsules taken by mouth are, there is every reason to think, completely valueless, and, so far, the treatment of a cold is simply the treatment of the symptoms: aspirin relieves pain when it exists, it reduces the fever, and it does nothing else. Nor has whisky any special effect, although it is so often prescribed as a cure, but it probably has some effect on devotees in making a cold more bearable.

Hay Fever is an allergic condition due to hypersensitiveness to the pollens of certain grasses. Its symptoms have already been described so far as the nose is concerned (see allergic rhinitis), but there may be other signs of allergy, such as redness of the eyes and itching of the skin. Hay fever is helped by desensitisation with increasing strengths of the substance responsible; since cases occur mainly in May or June, the course of injections should be given early in the year. It usually has to be repeated each year. An alternative is the use of one of the antihistamine drugs, which seem to afford relief—but not cure—to many people.

Epistaxis. Another condition which is not really a disease in itself but may be a symptom of one is *epistaxis* or nose-bleeding. Bleeding may be caused by injury, by nose-picking in children (who frequently put beads or other small objects in their noses), by polypi (similar to varicose veins), and by a number of general illnesses, such as high blood-pressure, blood diseases, and fevers. It sometimes occurs in women during their periods and in people at high altitudes, flying or mountaineering. Usually no special treatment is necessary, but if the bleeding becomes troublesome a doctor will probably pack the nostrils with gauze soaked in adrenalin. In ordinary cases cold compresses and lying down should suffice.

Tonsils and Adenoids. The commonest operation in the whole field of surgery is the removal of tonsils and adenoids. Indeed, in some places, and notably in America, it was formerly almost a routine to advocate the operation when children reached the age of three to five. The tonsils, one on each side, lie at the back of the throat, and are easily visible when the mouth is opened wide; the adenoids cannot be seen, since they lie at the back of the throat behind the nose. *Acute tonsillitis* is usually, but not always, caused by the streptococcus, and it results in sore throat, high fever, and difficulty in swallowing. But, as we saw elsewhere, its main danger is that it may become chronic and cause damage to the heart and other organs. Tonsillitis responds to antibiotics and the sulpha drugs. Adenoids, when they become infected, swell to an extent which may cause difficulty in breathing and block the air passage between the nose and throat—the Eustachian tube—leading to ear infection or loss of hearing. This produces a typical facial expression: the child looks dull and listless, breathes through its mouth, which is therefore constantly open, and talks in the manner of someone with a cold. It must be remembered that this occurs only in severe cases, that most children have some trouble with their tonsils and adenoids in early life, and that after the tenth year the tissues tend to shrink, so that difficulties after that time are much less frequent.

Although the operation is still common, it is probably true to say that it is less commonly advocated than before. In part this is due to the new drugs, which can nip infection in the bud, but it is also due to the realisation that the tonsils and adenoids are there for a purpose, that they act as a barrier to infection from germs entering the nose and throat. However, when they are badly infected there can be no useful purpose in keeping them and many good reasons why one should not.

Laryngitis, Pharyngitis, and Bronchitis. One of the difficulties created by infections in the upper part of the respiratory tract—the nose and throat—is that they can extend downwards, causing laryngitis, pharyngitis, or bronchitis. In laryngitis the voice-box is infected, there is a tickling cough and difficulty in speaking; the vocal cords are swollen and red. (It should be added that the same symptoms may also be due to too much talking, to neurosis, and, so non-smokers say, to too much smoking.) In simple cases it may help to inhale the vapour of Friar's Balsam, a half teaspoonful to a pint of water, but in more persistent cases a doctor should be called. Chronic laryngitis is a matter for an ear, nose, and throat specialist.

In pharyngitis there is pain on swallowing, the lymph glands in the neck may be swollen, and there is a rise in temperature; ordinary cases will respond to aspirin and gargles.

Bronchitis, however, is another matter, although it is perhaps less common than is often supposed. Every cough does not signify bronchitis; for it may be laryngitis, *tracheitis* (*i.e.*, inflammation of the windpipe), or the result of what is popularly known as "catarrh," when discharge from the back of the nose trickles down the throat. Some coughs may even have nothing to do with the breathing system at all, for example, wax in the ear may stimulate the coughing centre in the brain and produce a cough which is stopped when the wax is washed out. Bronchitis is ordinarily found only in the very young, the very old, or as a complication of other diseases, such as measles and influenza; it is not caused by any one germ, and the bacteria found may be streptococci, staphylococci, and others—or more usually a mixture. Acute bronchitis is rarely dangerous in itself, but it can spread (if you recall the anatomy of the respiratory system) down the larger tubes into the smaller ones, and thence into the lungs, causing *broncho-pneumonia*. In broncho-pneumonia the parts of the lungs affected are those near the ends of the bronchi, so there are patches of infection scattered throughout the lungs, and this is quite unlike *lobar pneumonia*, which: (*a*) is caused by one kind of germ, the pneumococcus; (*b*) affects a whole lobe of a lung at one time; and (*c*) can happen to anyone, of any age, at any time. In any kind of pneumonia there is fever, breathlessness, and ordinarily the disease responds to penicillin or the sulpha drugs. Lobar pneumonia, when untreated by the new drugs, used to show a "crisis" in seven to ten days—the temperature suddenly went down; in broncho-pneumonia

there is no crisis, but it is equally responsive to the new drugs.

Chronic Bronchitis is typically a disease of the old, or at any rate of those in later life. It is something which is always " there," but becomes worse in winter, in cities where there are fogs, in children with adenoids, and in older people who work in occupations where they are exposed to dust. Chronic bronchitis develops gradually as the result of many previous attacks and, since the lung tissues sooner or later become involved, are no longer elastic, and show *emphysema* or degeneration of the spongy substances which absorb oxygen, it would be wrong to pretend that there is any cure. People with chronic bronchitis may be helped by certain drugs, but they are not cured when irreversible changes have occurred. In this case, a large part will be played by cough mixtures, and it is important to realise that these are of two types: sedative and expectorant. A sedative mixture is intended to stop irritation which is useless, and does not perform the function of a cough in bringing up secretion. For instance, in laryngitis there is an irritating cough which is simply caused by stimulation of the tissues when there is no secretion to get rid of, and in this case it would be reasonable to give medicine which stops the cough, but when secretion is present it has to be removed, and here one has to take some drug which will make one cough more effectively. A stimulant mixture is one designed to liquefy the sputum and help to get it out of the system. (Incidentally, one of the best—even in these days of " wonder drugs "—is the solution of common salt used in Brompton Chest Hospital.) There are numerous good means of suppressing coughs, but probably very few good expectorants, although each patient swears by his own special mixture; and he may be right.

If lung or bronchial disease has been present for some time there may develop certain degenerative changes, such as *bronchiectasis* or *emphysema*. In bronchiectasis the bronchial tubes become dilated, first of all in a single lobe of one lung and then elsewhere, with the result that the stagnant and infected secretions are retained very largely within the chest, damage further the bronchial linings and the lung tissue, and end up in a vicious circle: pus accumulating, bronchitis, more pus, and more bronchitis. All the signs of chronic bronchitis are present, but what is typical is the large amounts of foul-smelling pus which are brought up. Bronchiectasis is a serious disease, but the antibiotics and the sulpha drugs have improved the outlook, and lung surgery (lobectomy or removal of a lobe and pneumothorax or collapsing of the lung) is also used in suitable cases. In emphysema the deterioration takes place in the lung tissue, and if you recall that the lung is the place where the oxygen of the air taken in meets the blood within the internal surfaces, you will see that the amount of surface available is of great importance. In fact, the normal lung internal surfaces are about the size—if they were spread out—of a tennis-court. But in emphysema the elastic tissue between the cells begins to give way, the surface available for oxygenising becomes smaller, and, as the walls of the cells collapse, so do the number of capillaries. In order to get the same amount of oxygen into the blood, the heart has to work much harder. So emphysema, like most chronic lung disease, leads to heart trouble—the heart has to work harder to get the blood through.

LUNG SURGERY.

Like heart surgery, lung surgery has greatly developed in recent years and is used in four main categories of disease: infections, cysts, tumours, and in wounds. Infection is mainly due to bronchiectasis and tuberculosis—although other infections may arise; cysts are not very common, and need not necessarily give trouble unless they become infected; tumours, if malignant, obviously have to be removed; and how a wound is treated depends on its severity. Generally speaking, the operations performed are: (1) drainage; (2) removal of part of the lung; or (3) collapse of the lung. *Drainage* is carried out when—as in the case of an abscess or infected cyst—there is an area containing pus, and the purpose of the procedure is to let the pus out. *Removal of part of the lung*, or in some cases a whole lung, is carried out where there exists bronchiectasis or tuberculosis or cancer limited to a particular area; clearly such an operation is serious, but the results today are good, although, of course, this depends in part upon the initial condition from which the patient was suffering. *Lung collapse* is carried out when infection is present, but it is thought that recovery might occur after a " rest "; for collapse means that the affected lung is put out of action and is not used for breathing. Collapse is carried out in various ways. In *pneumothorax* air is injected into the chest by a simple procedure, causing collapse; in *pneumoperitoneum* air is injected into the abdomen, with the same result, since by pushing up the diaphragm it causes collapse; in *phrenic nerve crush* the nerve supplying the diaphragm is crushed under a local anæsthetic where it passes through the neck. In more serious cases *thoracoplasty*—the removal of all or portions of the upper ribs—may be performed under a general anæsthetic.

Lung Cancer is one of the most obvious reasons for surgery, and as most people know by now, it has been established that there is some connection between lung cancer and tobacco-smoking. The facts, as known, are complicated, but some of the more important are these:

(*a*) Between the ages of fifty and sixty-four those who smoke more than twenty cigarettes a day have a death-rate more than twice as high as non-smokers (although not necessarily from lung cancer).

(*b*) Five moderate smokers die of lung cancer to every one non-smoker and fifteen or sixteen heavy smokers.

(*c*) It seems certain that other factors are important. For example, the death-rate from lung cancer is very much higher in cities than in the country, the incidence is higher amongst cigarette smokers than amongst pipe or cigar smokers. Diesel fumes and smog probably play a quite important part, and the considerable increase in cancer (which is, however, commoner in men than in women) runs parallel both with increased cigarette smoking and increased fumes from car exhausts—particularly Diesel fumes.

(*d*) As in the case of coronary thrombosis, we can see that it is not easy to analyse out the real cause of the trouble in lung cancer. We have to consider the soil—the person affected. Is there, perhaps, something within the individual which predisposes him to cancer, and that smoking merely determines *where* he will get it? We do not know, but it is a possibility.

There are few early symptoms and the condition is usually discovered by accident at a mass X-ray centre. Pain in the chest, loss of weight, and coughing blood are late symptoms. The only treatment, if the disease is found in time, is removal of the whole or part of the affected lung.

Asthma is a chest disease which we will discuss at this point, since it will serve to introduce the general problem of *allergy*, although other allergic diseases will be mentioned elsewhere according to the part of the body affected. The causes of asthma are mainly three: allergy, chronic bronchitis, and emotional disturbances, although in varying degrees they go together in any one person; there is a likelihood that allergy and emotional sensitivity are related and that in cases with bronchitis the patient may be allergic to his own germs. People may be allergic to all sorts of things: to pollens, feathers, and numerous particles present in the form of dust in any house or any city street; to foods such as shellfish, to penicillin, to injections given them at the doctor's, and a case was even reported from America in which a man got a divorce because he was allergic to his wife and developed a skin-rash whenever she embraced him! Asthma is simply one form of allergy, in this case affecting the bronchi, which go into spasm when the person comes into contact with the stuff to which he is sensitive. But allergy can affect the nose and eyes, as in hay fever, the

skin, as in dermatitis, the joints, and the bowels. In an asthma attack the patient finds it more and more difficult to breathe, his chest is widely expanded, and the main trouble is in breathing out. Such attacks often come on at night, and may occur almost daily, or as infrequently as one every few months. Although asthma is an allergic disease, the attacks are very often set off by emotional crises of rage or resentment. In some cases the emotional element is even more obvious, as when a woman allergic to roses developed an attack when shown into a room in which there was a bunch of roses on the table, which were, in fact, artificial! The immediate treatment for an attack is to give something which will relax the tubes, usually adrenalin injections or ephedrene taken as tablets by mouth. The long-term treatment is directed towards finding the substance to which the patient is sensitive and by a course of injections attempting to desensitise him. Unfortunately this does not always work, but in some cases antihistamine drugs may help. However, the trouble with asthma, as with other chronic lung diseases, is that when it has existed for some time changes occur which are irreversible, such as chronic bronchitis or emphysema. When this stage is reached the best that can be done (and it is a great deal) is nevertheless palliation.

Allergy is to be understood as a perversion of the normal body reactions towards certain substances—mainly, but not always, proteins. Such substances act, just as do the toxins of germs, as antigens: that is to say they cause the formation of counter-substances designed to neutralise their influence, and these counter-substances are known as antibodies. Normally, this takes place successfully within the blood, and when a second dose of the foreign protein gets into the body its effect is neutralised. But when, due to some unknown cause, this does not happen, the antigen, or foreign substance, gets into the body cells and causes the liberation of a poisonous chemical known as histamine. It is this which causes the symptoms in allergic diseases, and which is sometimes countered by the antihistamine drugs. In extreme and rather rare cases a person with this sort of disability may get an injection, and if there has not been sufficient time for antibodies to form, a second injection of a completely harmless stuff, such as a serum, may lead to sudden death. This is known as *anaphylactic shock.*

Allergy, then, is due to an inability to produce antibodies, and this, in turn, is the result of: (*a*) heredity—for such diseases run in families; (*b*) to the person's physical condition at the time; and (*c*) to emotional causes which can interfere with antibody formation.

DISEASES OF THE DIGESTIVE TRACT

INTRODUCTION.

The digestive tract begins at the mouth and ends at the rectum, where the waste products are excreted. The food taken in at the mouth is moistened with saliva secreted by the salivary glands, of which the largest are the parotid glands —they are the ones which become swollen in mumps. The smaller glands are the submaxillary (under the jaw) and the sublingual (under the tongue). The act of chewing breaks the food down and helps to mix it with the saliva. Saliva contains an enzyme called ptyalin, which starts the digestion of starchy foods, and the food thus reduced to a pulp passes down the œsophagus, a tube about 2 ft. long leading through the chest down to the stomach, where the main part of digestion begins. The gastric juice, as everyone knows, contains hydrochloric acid, which in concentrated form is a dangerous caustic and will burn holes in carpets or anything else if allowed to —as certain advertisers at one time were not slow to point out. Advertisements used to show the dreadful effect of the acid on a carpet, and invite the gullible to consider what would be the effect on the much more delicate stomach; the effect could, of course, be neutralised by "Biffo" or whatever was the name of the stomach powder. This, needless to say, is a piece of nonsense; hydrochloric acid in the stomach is important for digestion (although some seem to manage without it), and it exists in such a diluted state that it could not burn a hole in a piece of tissue paper. However, the details of this will be discussed later when we are talking about ulcers. Suffice it to say that the acid is intended to be there, and causes harm only when something else has gone wrong with the stomach.

Also in the juices secreted by glands in the stomach lining are the substances known as enzymes, which are found not only there but play a large part in all body processes. By bringing about chemical changes they make life possible, and we have already mentioned one, ptyalin, which functions in the saliva to break down starch into sugar. The word enzyme is derived from two Greek words meaning "in yeast," because the first enzyme known to Man was the one in yeast which breaks down starchy foods into sugar and, given time, as brewers and some less-respectable gentlemen know, into alcohol. In the stomach the main enzymes are pepsin, which further digests starches into sugar, and rennin, which curdles milk (essence of rennet obtained from the cow's stomach is the stuff used to make curds and whey). In the small intestine the food comes under the influence of the alkaline juices, secreted partly by the intestine itself and partly by the pancreas; the most important enzymes here are trypsin, which breaks down proteins, amylase, which continues the work of breaking down starches, and lipase, which breaks down fats.

The end result is that by the time it reaches the end of the small intestine all the food we have eaten, however varied, is broken down into very simple chemicals: the proteins into substances known as amino-acids, the fats into glycerine and fatty acids, and the starches and sugars into glucose. The fact that glucose does not have to be digested, and that carbohydrates generally are the fuel of the body give rise to the quaint notion that glucose makes you energetic (hence all the tablets, drinks, and so on containing glucose which, from the remarks made about them by advertisers, one might suppose to be the elixir of life). Unfortunately, although glucose is useful as a temporary food in those who cannot—as after an operation—absorb anything else, there are very few people who need any extra. Most of us don't need more energy; we need more brains to make use of what energy we have. A spoonful of glucose is no better and no worse than a couple of lumps of ordinary sugar or a slice of bread so far as giving energy is concerned, for the simple reason that all end up in the same way; as glucose.

After being thus broken down, the fatty acids and glycerine enter the lymph channels passing from the intestinal walls and so get into the blood and thence to the areas under the skin which give some ladies their "vital statistics" and many men and women their "middle-aged spread," but the amino-acids and glucose pass through a special system of veins, the portal system, to the liver to be stored until they are needed.

The small intestine includes the duodenum, which joins the stomach at the lower end, where there is a sort of valve known as the pylorus. The duodenum is about a foot long and continues into the jejunum and ileum, which together are about 23 ft. long. At the end of the ileum the small intestine joins the large intestine or colon, and this, at the right-hand lower corner of the abdomen, is the site of the appendix. Finally, the 5-ft.-long large intestine passes to the rectum, which is only 6 in. long and leads to the anus, the band of muscle which ends the digestive tract.

Later on we shall deal with problems of diet and nutrition, but at present it is more convenient to wend our way down the length of the alimentary canal and discuss the various diseases which can affect it. Little need be said about the teeth, since most people know about the principles of dental care, although they do not always carry them out with any degree of completeness. Briefly these are: brushing the teeth at least twice a day, but preferably after every meal; avoiding too much sweet food, and especially the kind of nauseous confections which stick to the teeth; and going to the dentist every six months. A *gumboil* is an abscess at the root of a tooth which causes the all-too-familiar swelling of the face.

The only first-aid treatment for this is the old one of heat applied outside, aspirin for pain, and hot mouth-washes. Sooner or later the dentist will have to be consulted.

Elsewhere we have mentioned *tonsillitis* and *pharyngitis*, and so far as this region is concerned the other "ituses" are *stomatitis*, a general infection of the mouth, and *glossitis*, an infection of the tongue. Stomatitis can be due to many causes: to a fungus infection common in babies whose mothers take insufficient care in the hygiene of feeding (this is known as "thrush"); to various other sorts of infection often predisposed to by malnutrition; and to certain drugs, such as mercury.

In thrush, white patches form within the mouth, but the condition can easily be treated by a doctor. The other types are usually characterised by a bad taste in the mouth, bad breath, excessive salivation, and sometimes by a burning sensation. Their treatment depends upon the cause, and they should therefore be referred to the G.P. Glossitis, too, may be the end result of many influences, and shows itself by some unusual appearance of the tongue: redness, soreness, white or black patches, or ulcers. Sometimes the patches are in a form resembling a map, which doctors with their irrepressible sense of humour—not always shared by their patients—describe as "geographical tongue." Sometimes, and paradoxically, the cause may be the use of penicillin, which, by killing some germs, encourages the growth of others; sometimes it is the result of oral sepsis. But all these conditions, if they last any length of time, should be referred to a doctor, especially in older people, and especially if ulcers are present. *Ulcers of the tongue, although they are often of little significance, may be serious, and it is not worth while taking risks.* The œsophagus, too, may be affected by a number of diseases usually characterised by pain or difficulty in swallowing. This is known as *œsophagitis*, and may be due to the passage of burning, hot, or caustic liquids. Or there may be paralysis of the nerves supplying the muscle, which also leads to difficulty in swallowing. But the most important disease which can affect this area is *cancer of the œsophagus*. It is estimated that about 1 per cent. of all cancer deaths are due to this cause, that it affects men more often than women, and ordinarily men between fifty and seventy. The symptoms are difficulty in swallowing and loss of weight. Until recently, the outlook in the condition was absolutely hopeless, and doctors and relatives had to stand helplessly by whilst the patient virtually starved before their eyes. But now advances in chest surgery make it possible for an operation to be carried out in which the diseased area is cut out, the stomach brought up into the chest, and stitched to the remaining part of the œsophagus. Still more recently, almost the whole œsophagus has been removed and replaced with a plastic tube. Of course, this can be done only when the disease is caught in time.

Often difficulty in swallowing or a sensation of choking is due to solely emotional causes. This is known as *globus hystericus*, and requires to be treated psychologically. Lastly, there sometimes develops in the œsophagus what is described as a *diverticulum*, which is to this area what an aneurism is to an artery: *i.e.*, it is a bulging out of the wall which creates a sac. A diverticulum does not necessarily cause trouble, but the larger ones do in three ways: (1) they collect food which every now and then comes back into the mouth; (2) they may become large enough to cause obstruction; and (3) they are likely when their contents become infected to cause lung disease. If they are at this stage the only treatment is surgery, in which the "ballooning" part is tied off at the base. The operation is obviously a major one, but recovery is almost invariable.

Peptic Ulcer is a name covering two separate conditions—*gastric ulcer*, which is an ulcer in the stomach, and *duodenal ulcer* in the duodenum. The immediate cause of ulceration is that the digestive juices have, for some reason or another, digested away a part of the wall of the tract. It appears that ordinarily, although the stomach can digest protein from outside, it does not digest itself, because there are chemicals in the lining—known tentatively as "anti-enzymes"—which neutralise the effect of the hydrochloric acid and the enzymes. Why does this protection break down?

This is an important disease because it is so common, and perhaps we had better have some facts:

(*a*) About 10 per cent. of all adults have had at one time or another an ulcer of the stomach or duodenum.

(*b*) Nearly 90 per cent. of these ulcers clear up by purely medical attention, without surgery.

(*c*) When people say they have "an ulcer in the stomach" they usually mean an ulcer in the duodenum. Only one out of twelve ulcers are in the stomach.

(*d*) The indications for operation are, in general: (1) when the ulcer is chronic and medical treatment has failed; (2) when there is severe bleeding caused by the ulcer eating into a blood-vessel; (3) when, as sometimes happens, the ulcer forms scar tissue which contracts and obstructs the passage of food; (4) when an ulcer perforates.

A perforated ulcer is one which has eaten right through the stomach wall, and in these circumstances an emergency operation is necessary, for the stomach contents pass into the abdominal cavity, causing *peritonitis*—*i.e.*, a septic infection of the peritoneum, the delicate lining which covers the abdominal organs as the pericardium covers the heart and the pleura the lungs.

Typically, ulcer pain is in the upper abdomen, comes on about half an hour to two hours (depending upon its site) after meals, and is relieved to a greater or lesser extent by alkalis or taking more food. The medical treatment consists in dieting on easily digested foods taken "little and often" so that the stomach is never empty but never full. Alkaline powders are usually prescribed by the doctor, and sometimes muscle relaxants such as atropine are used to relieve the spasm which is the immediate cause of pain. It cannot be too strongly emphasised that symptoms such as those described above if they persist for any length of time should be referred to a doctor. Self-treatment is very risky.

Operative treatment is designed to reduce the hyperacidity which causes the trouble. The two main operations performed are *gastrojejunostomy*, in which part of the jejunum is stitched to the stomach so that the alkaline juices of the small intestine can enter the stomach and partially neutralise the excess acid, and, much more frequent nowadays, *partial gastrectomy*. In this operation the part of the stomach which contains the acid-secreting glands—the lower three-quarters—is removed, the duodenum is closed, and the remaining quarter of the stomach is stitched to the small intestine. This operation is very successful, and only about 1 per cent. of cases have any further symptoms. Finally, *vagotomy* is sometimes performed—*i.e.*, cutting of the vagus nerve, which passes down from the brain through the neck and chest to the stomach; for it is the impulses passing down this nerve which are responsible for the over-secretion of acid.

Why is peptic ulcer becoming so common? Most doctors would agree that it is one of the diseases caused by stress and the problems facing us in an age of anxiety. It is more common in industrial communities than in peasant ones and in people whose work is a source of worry—who are continually tense. There is no reason at all to suppose that irregular meals and the other dietary reasons often given have any influence in producing an ulcer, although one must, naturally, be careful about these when an ulcer is present. Duodenal ulcer is common in the fairly young and fit, stomach ulcer in the old and poorly. For some reason, although duodenal ulcers almost never become malignant, about 10 per cent. of stomach ulcers do so, even although there may have been no previous history of dyspepsia.

Cancer of the Stomach is found most frequently in men between forty-five and sixty. The pain of cancer tends to be constant rather than periodic, and there is increasing loss of weight and

anæmia. Operation is necessary, but the outlook is good if the condition is discovered in time. There would be much less risk of cancer getting beyond the stage where operation can help if people with "indigestion" lasting any length of time would put themselves immediately under medical care with periodic check-ups. A curious feature of cancer of the stomach is that hydrochloric acid is completely absent.

Gastritis means inflammation of the stomach lining: it may be acute or chronic. In acute gastritis eating too much food or eating unsuitable food in a person with a sensitive stomach may lead to symptoms, but the most frequent cause is too much alcohol. The symptoms, in general, are those of a "hangover": headache, depression, loss of appetite, and, as P. G. Wodehouse puts it, "a feeling that you're going to die in about five minutes." In more severe cases there may be a raised temperature and diarrhœa. The treatment is to avoid irritating the stomach further, to eat only as much bland food as one feels inclined to, and to take some alkaline medicine—"fizzy" salts are suitable for this. Since "gastritis," strictly speaking, refers to any form of irritation of the stomach lining, it can also be applied to serious conditions, as when poisons such as strong acids or other corrosives are swallowed, intentionally or otherwise. Here we are discussing only the condition which is ordinarily understood when the word is used.

Chronic gastritis, although it may be associated with kidney, lung, heart, or blood diseases, and with diabetes, is usually the sequel to frequent attacks of acute gastritis. Here, again, the appetite is poor, there is depression and a feeling of discomfort rather than pain after taking food. Headache, flatulence, and vomiting or nausea in the morning are common features. Although one is inclined to picture the case of chronic gastritis as typically a retired colonel from India or some other tropical spot who has subsisted for years on curries and alcohol, there is no reason to suppose that curries have anything to do with it. Even alcohol can be taken in large amounts without doing any harm (except to one's pocket!) provided it is taken diluted and with meals. In fact, many elderly ladies of irreproachable character suffer from chronic gastritis, and it is well to remember that strong tea taken too frequently causes red noses more frequently than strong drink. Chronic gastritis requires special medical attention.

Nervous or Functional Dyspepsia is a term used by doctors which means, first, that the condition is basically a sign of general neurosis and, as such, needs a psychological rather than a physical approach, and secondly, that no signs of organic disease of the stomach have been found on examination. This, of course, does not make the discomfort any easier to bear from the point of view of the patient. The symptoms tend to be different from the more or less cut-and-dried ones of ulcer: for example, flatulence and nervous vomiting are frequent. *Flatulence* is a gastric neurosis due to the habit of swallowing air; for no "gas" is formed in the stomach, and all that is brought up has previously been unconsciously, swallowed. Trying to "bring it up" as many people do to the distress of those near by, only results in more air being swallowed, so the desire should be resisted. *Anorexia nervosa* is another gastric neurosis in which the patient refuses to take food or vomits it up when it has been taken. In some cases even death may result from self-imposed starvation of this type, for which psychological treatment is necessary.

The end of the stomach where it joins the duodenum is known as the pylorus, a ring of muscle which acts as a valve and allows the partially digested food to pass from the stomach only when it is ready for further digestion by the intestinal juices. In newly born babies the pylorus muscle may be too thick or it may tend to go into spasm easily, with the result that food cannot get out of the stomach and is vomited up. This is known as *pyloric stenosis*, and is quite common in babies of two or three weeks of age—three times more frequently in boys than in girls. Without treatment the continued vomiting, which is very forceful in character, would lead to death through malnutrition and lack of fluids, but fortunately treatment is relatively simple. In some cases, injections of a drug to relax the spasm is sufficient, but more often an operation is necessary. A small incision is made under an anæsthetic, and the pylorus muscle is slit down its entire length (of course, only the muscle fibres are cut, not the inner lining of the stomach). The operation is very safe, and the wound heals within about a week, after which the infant has no further trouble.

The small intestine can be affected by a number of diseases, although much less frequently than the stomach and duodenum. Here we shall mention only two of the more common conditions: regional ileitis and intestinal obstruction.

Regional Ileitis is an inflammation of the small intestine frequently found in young men and women. The cause is unknown, but it leads to ulceration and small perforations which cause adhesions between the affected area and other parts of the small intestine. Such a condition requires surgical treatment, which usually takes the form of short-circuiting the diseased area and joining together the healthy ends of the loop. Sometimes the diseased area is cut away altogether and the healthy end joined to the large intestine. By this means the vast majority of cases can be cured.

Intestinal Obstruction can be caused by a tumour, by a loop of intestine becoming twisted on itself (volvulus), by the bowel being caught in a hernial sac, or by the contraction of old adhesions. Here, too, the surgeon will either by-pass the area or if the intestine has become damaged and gangrene has set in he will remove the whole of the affected part. Acute (*i.e.*, sudden) obstruction is a surgical emergency, and if an operation is not performed death will occur in a few days. The symptoms are severe colic, profuse vomiting, distended abdomen, and collapse; no bowel motions are passed. Chronic obstruction, in which the blockage is gradual, is usually due to a tumour; the symptoms are periodic attacks of vomiting, constipation alternating with diarrhœa, and loss of weight.

In children, *intussusception* is not uncommon, especially in boys under the age of two. Here one part of bowel becomes telescoped into another, leading to colic and the passage of motions consisting of blood and mucus. Later there will be vomiting and collapse. Operation, of course, is necessary.

Constipation. Here, perhaps, we had better mention the question of constipation, about which so many people hold such pronounced views. They believe that constipation is the root of all evil, that it causes a mysterious condition known to them (although, alas, not to doctors) as "auto-intoxication." Sedulously fostered by the manufacturers of patent medicines, their beliefs range from the notion that headaches, spotty skin, muddy skin, and tiredness are caused by constipation, to the more extreme idea that the whole system is being poisoned and that, if the bowels do not work, the individual will shortly die. Of course, all this is the merest rubbish; for, as Professor Samson Wright, whose *Applied Physiology* is one of the most famous of medical text-books, has pointed out, there is no such thing as absorption of poisonous products from the bowel. There is no such thing as "auto-intoxication." "The symptoms of constipation," he writes, "are largely due to distension and mechanical irritation of the rectum." It has been shown that an enema removes these symptoms *immediately*, which would not be the case if they were due to poisons in the blood, and exactly the same symptoms can be produced by packing the rectum with cotton-wool. Wright mentions the case of a man who went for just over a year without a bowel motion, and at the end of that time, although his abdomen was distended and he felt some discomfort, he was not noticeably ill. Needless to say, telling these facts to the purgative addict will only make him annoyed, but it is as well to note that if no known diseases are due to constipation (although constipation may be a symptom of another disease), the regular use of purgatives *can* cause disease.

Constipation should be treated first by diet

containing plenty of roughage—bran and oatmeal are excellent—plenty of stewed and fresh fruits, and at least three pints of fluid should be taken daily. Failing that, one of the best things to take is "Senokot," a proprietary product prepared from senna pods. Never to be taken regularly are liquid paraffin, since there is some evidence that it may cause cancer, castor oil, preparations of aloes, Epsom salts, and all the other dreadful stuff that people swill down.

An extreme form of constipation is *Hirschsprung's disease*, which is found in children, usually males, and leads to constipation over long periods, so that motions may occur only every few months. The condition is probably due to spasm in the intestine, and can be relieved by an operation in which the nerves producing the spasm are divided.

Diarrhœa has already been discussed under the heading of infectious diseases, and the types due to infection will be found there. However, diarrhœa can be the result of other influences: food that "hasn't agreed" with one; certain poisons, such as mercury, arsenic, and purgatives; and to nervous tension. The treatment depends on the cause, but in mild cases a single large dose of castor oil is a good idea. This gets rid of whatever is causing the trouble (provided that it is not a serious infection or nervous diarrhœa we are dealing with), and it has a slightly constipating after-effect. Other mixtures given by doctors are chalk and opium or kaolin and morphia—the opium and morphia are in very small quantities.

DISEASES OF THE LARGE INTESTINE.

The large intestine consists of the colon and the rectum. If you put your hand down in the right-hand lower part of the abdomen, then you are covering the area where the small intestine meets the colon, and also where the appendix, a small, blind tube about 2 in. long, hangs from the beginning of the colon. Now move your hand upwards to the margin of the ribs, then straight across the abdomen at the level of the stomach and down the other side to the corresponding place on the left side from where you began. The path you will have mapped out is that of the colon, which, as the name implies, is much wider than the small intestine.

The colon is just as subject to disease as the stomach. In fact, Dr. Clark Kennedy says that most so-called indigestion "is not due to duodenal or gastric ulceration . . . but to disorder of the mechanics of the large bowel aggravated by introspection and *again and again by the misuse of aperients*" (the writer's italics). Irritation of the colon is known as colitis, and there are two types: ulcerative colitis and mucous colitis. As in the case of stomach and duodenal ulcers, mental factors play a large part, but, since not everyone with anxiety or who is under stress develops colitis, we have to assume that this condition, and indeed the other stress diseases, are caused by an interplay between hereditary disposition, certain physical factors not yet completely understood, and stress.

Ulcerative Colitis is a serious disease in which there is not only inflammation of the intestinal wall but also ulceration. The patient, usually an adult between twenty and forty, and most commonly a woman, develops diarrhœa, with passage of blood, pus, and mucus; there is an irregular fever, although no germs have ever been conclusively found to account for this. Sometimes the disease begins abruptly and ends in quite a short time in death, but more often it runs a course of many months in a milder form. Medical treatment, such as washing out the colon, may be used, and various drugs have been tried, and in about 75 per cent. of cases these prove adequate. But in the remaining 25 per cent. of cases operation is necessary. The operation performed is *ileostomy*, in which the end of the small intestine is brought out on the abdominal wall so that the motions pass out there, the colon is thus put out of action and can be rested. In about 10 per cent. of cases the ulceration heals and the small and large intestines can be joined up again by closing the opening on the abdomen, but more often the opening must be permanent. If, in spite of this, the bleeding and diarrhœa persist, the only possibility is to perform a *colectomy*—*i.e.*, to remove the whole of the colon. Although this is a large-scale operation, the recovery rate is well over 90 per cent.

Mucous Colitis is a less serious disease which appears to be almost entirely nervous in origin. As in the other type, there are attacks of diarrhœa, in which quantities of mucus and membranous material—actually parts of the lining of the bowel—are passed. There is no blood, and the treatment is medical, with sedatives and antispasmodics, drugs which relax the spasm in the colon.

Appendicitis is a disease which mysteriously became popular towards the beginning of this century. Appendicitis begins with pain over the stomach (*i.e.*, in the *upper* part of the abdomen, and not over the site of the appendix). The pain remains there for some hours and then moves to the right lower part of the abdomen; there is usually fever and sometimes vomiting. It is important to realise that in any case of abdominal pain purges should never on any account be given; in appendicitis particularly purges may lead to death from peritonitis. The treatment of appendicitis is nearly always surgical, but in a few cases antibiotics may be used.

Bleeding from the Rectum is a common symptom which may be due to a number of causes: hæmorrhoids, dysentery, typhoid, some blood diseases such as purpura, and tumours. Bleeding from a gastric or duodenal ulcer leads to black motions or *melæna*. The blood in this case is black because it has been changed in its passage through the digestive tract, and although black motions may result from harmless causes—*e.g.*, when iron-containing medicines are being taken—it should always be referred to a doctor. In fact, any bleeding from the rectum should be investigated.

Visceroptosis occurs when the bands of tissue holding up any of the abdominal organs begin to sag so that the organs sink downwards. The symptoms are vague: dyspeptic tendencies, constipation, and a general feeling of being unwell. Although it often occurs in young women who have had too many pregnancies too quickly, there is a large neurotic element involved. Treatment is directed towards the neurotic condition accompanied by exercises and perhaps the use of an abdominal belt to support the sagging muscles.

Cœliac Disease. Some children are born with an innate difficulty in absorbing fats from the small intestine. They suffer from diarrhœa, in which large quantities of partly digested fats are passed from the body. The passage of fats in this way is known as *steatorrhœa*, and the disease is described as *cœliac disease* (Gee's disease), or, if it occurs in the tropics, *tropical sprue*. Adults, too, may suffer from the disease, but in children the important factor is that the disease is also associated with defective absorption of iron and calcium, so they tend to become anæmic and may develop rickets. It is necessary to give a fat-free diet, vitamins and calcium, and plenty of protein. "Sprulac," which is a dried defatted milk powder, is frequently given. The condition may go on for years, but the outlook is quite good. Tropical sprue is not caused by living in the tropics, but tropical conditions may bring out a latent tendency to steatorrhœa.

Diverticulitis. In diverticulitis an inborn weakness of the large intestine leads to weakness of the muscular wall of the large intestine, and through the weakened areas the mucous membrane or lining of the bowel pushes through. Probably at least 5–10 per cent. of all people have some diverticulæ, but they give trouble only when they become inflamed through some of the fæcal contents of the intestine getting trapped within them. There is pain, usually in the left lower part of the abdomen, slight fever, and general abdominal tenderness. Diverticulitis can usually

be treated by dieting, rest, and antibiotics or sulpha drugs. The vast majority of cases can be dealt with in this way; but if they do not respond, it may be necessary to remove the affected area.

Cancer of the Large Intestine. The large intestine is one of the commonest sites for cancer. The symptoms, which usually occur from forty to sixty, are twice as common in men as in women, and, in general (although this depends upon the part of the colon affected), they are: passing of blood from the rectum, loss of weight, anæmia, and increasing constipation. Pain occurs as the obstruction increases, and finally the signs of acute obstruction already described make their appearance. Fortunately, symptoms usually appear early in the disease, so it can frequently be caught in time. Surgery is the only remedy, and in early cases may be done in one stage by removal of the affected part, but if obstruction has begun it is necessary to perform an operation—*colostomy*—in which a part of the intestine, as in ileostomy, is brought out on to the abdominal wall, so that the fæces discharge from the side of the abdomen instead of through the rectum. This operation is followed a few weeks later by removal of the part containing the tumour.

Hernia. The body, unfortunately, is supplied with many weak areas in the abdominal wall and elsewhere through which structures such as the intestines can thrust their way to where they are not supposed to be. This condition is known as hernia. There are numerous different types of hernias; for example, they may occur in the canal below the groin through which the large blood-vessels pass back and forth between the legs and abdomen or in the larger inguinal canal just above. They are also found at the umbilicus, a weak area through which before birth the child was supplied with all its needs from its mother's circulation, or right in the middle of the abdomen below the umbilicus, where the two bands of muscle which form the abdominal wall come together but often leave a weakness in between. There may also be hernias internally, or in the diaphragm, or over the site of an operation scar. In the groin we speak of *inguinal hernia*, in the area where the vessels pass between abdomen and legs slightly below the groin we speak of *femoral hernia*, at the umbilicur, *umbilical hernia*, and between the two abdominal muscles, *ventral hernia*. A *diaphragmatic hernia* is one in which the stomach pushes its way into the chest through a weak part of the diaphragm.

Hernias may occur at any age, and indeed many children are born with them. In later life they are generally caused by a combination of developmental weaknesses in the area concerned, flabby muscles, and sudden strains, such as lifting heavy weights. The main danger from a hernia, apart from its inconvenience, is that it may become *strangulated*—that is, a part of the intestine may become caught in the hernial sac, and becoming filled with intestinal contents, swell up and be unable to escape. This causes all the symptoms of intestinal obstruction and has to be treated as an emergency, or else gangrene of the part which is caught and possibly peritonitis will occur.

Although many people, fearing surgery, wear a truss—that is a belt which by pressing on the part keeps the weak area compressed—there is no doubt that hernias, except in the old and infirm, should be operated on. No matter how comfortable the truss may be, it is a continual nuisance and interferes with many activities, such as swimming; nor are trusses always adequate in performing their function. The operation involves replacing the herniated organs back into the abdominal cavity, removing the sac of peritoneum (*i.e.*, the thin lining of the abdomen which has been pushed out by the organ), and then repairing the muscle wall where it was weakened. The main sign that a hernia exists (at least so far as femoral, inguinal, umbilical, ventral, or scar hernias are concerned) is a soft swelling over the place where the weakness exists. Unless strangulation occurs, there need be no other symptoms. But any bulge in the groin or upper thigh or, indeed, anywhere, should be immediately referred to a doctor.

Cancer of the Rectum. The rectum and anus are afflicted by two common diseases: cancer of the rectum and hæmorrhoids. In cancer of the rectum the symptoms are similar to those described under cancer of the large intestine. Operation is imperative as soon as possible, and it is usual to remove the anus, rectum, and the lower part of the colon, subsequently creating a permanent colostomy.

The anus, the last inch of the intestinal canal, is a sphincter, a band of muscle which controls the exit of fæces from the bowels. In addition to hæmorrhoids, the anus may be the site of fissures (*i.e.*, ulcers of the lining), fistulas (abnormal tracts leading from the lower rectum to the skin), and polyps (non-malignant growths). *Fissures* are elongated ulcers rather like a crack in the mucous lining which cause pain every time the bowels are moved. They tend, if untreated, to get deeper and more inflamed. Treatment is surgical, by cutting the sphincter muscle to allow relaxing and healing. A *fistula*, as has been mentioned, is an abnormal channel between the lower rectum and the skin—*i.e.*, it comes out somewhere around the anus. Nearly always it is the result of a previous infection, such as a boil or abscess, in the region of the anus. The treatment is surgical, as a fistula rarely clears up by itself. The channel is opened and cleared out, then packing is put in to enable it to heal from the bottom up. *Polyps* may vary in size from a pea to a golf ball, and the first sign may be fairly severe hæmorrhage from the rectum. Sometimes there is no bleeding, but the polyp suddenly appears protruding from the anus after a bowel movement. It is painless, and not in itself serious, but should nevertheless always be removed (this can often be done by cauterising without an anæsthetic), since some authorities believe that such growths may become cancerous.

Hæmorrhoids are simply varicose veins in the rectal and anal regions. They are very common, and are caused probably in about equal degrees by inherited weakness of the veins, strain such as heavy lifting, and constipation (this is one of the very few conditions in which constipation may do some damage, due to the mechanical pressure of hardened fæces in the rectum on the veins). Pregnant women are liable to develop hæmorrhoids or "*piles*," as they are commonly called, owing to the pressure of the baby's head in the pelvis. Hæmorrhoids may be external or internal, the former being in the anal region below the sphincter, the latter in the rectum; the two usually go together. There may be no symptoms, but the veins are liable to bleed, to get thrombosed (*i.e.*, a clot forms within) or to become infected. When clotting or infection occurs the piles enlarge and tend to be pushed out through the anus during defæcation, when they form extremely painful external swellings. Treatment in simple cases may be by the use of suppositories—cones of a firm grease containing suitable medicaments which are inserted in the rectum—in other cases the veins may be injected, as with varicose veins of the leg, in order to close them, but when there is much bleeding, thrombosis, infection, or interference with bowel movements they should be removed surgically.

DISEASES OF THE LIVER AND GALL-BLADDER.

The functions and site of the liver have been described elsewhere, so no more need be said about these. Presumably the most common associations of the layman in relation to the liver would be the two words "liverish" and "jaundice." Feeling *liverish*, one gathers, produces a sort of sensation like a hangover (which it frequently is), but there is no medical term corresponding to the word, nor is there any reason at all to suppose that it has anything whatever to do with the liver. Most likely it is an attack of mild gastritis, and should be treated as such.

Jaundice is easily recognised by the yellowish skin, the degree of colouring depending upon the severity of the case. In mild cases it may only be

noticeable in the whites of the eyes. Less well-known symptoms of jaundice are itching of the skin, dark-coloured urine and pale motions, depression, loss of appetite, and tiredness. Jaundice, however, is not in itself a disease; rather it is a symptom of many diseases, amongst which some of the commonest are:

(1) Blockage of the bile ducts, which normally carry the bile and its pigments into the intestines (it is the pigments which produce the yellow coloration). The blockage may be caused by gall-stones, parasites, tumours, or in the liver itself when cirrhosis is present. The bile pigments, unable to get through the duct into the intestine—hence the pale motions—pass backwards into the blood-stream and are filtered into the urine, which therefore becomes stained, and into the skin. This is known as *obstructive jaundice*.

(2) *Infective jaundice*, on the other hand, results from various types of organism such as spirochætes and viruses. Examples are infective hepatitis, spirochætal jaundice, yellow fever, malaria, and some cases of syphilis. Certain poisons, such as chloroform, arsenic, phosphorus, and snake venom, can also cause jaundice, which in this case is due to damage to the liver.

(3) *Haemolytic jaundice* is found in some blood diseases, such as pernicious anæmia, acholuric jaundice, and blackwater fever. Its immediate cause is breaking down of the red cells at a rate too rapid for the liver to absorb the products.

The treatment of jaundice depends entirely upon its cause. The infective and hæmolytic types have already been dealt with under infectious diseases and diseases of the blood respectively, so it only remains to deal with obstructive jaundice, and this leads us to the subject of the gall-bladder and *gall-stones*. Doctors in their perverse way refer to inflammation of the gall-bladder as *cholecystitis* and to the condition of having gall-stones as *cholelithiasis* (just as Americans refer to typists as "stenographers" and lifts as "elevators").

The gall-bladder is pear-shaped and lies below the liver. It ends, at the "stalk" of the pear, in a tube called the cystic duct, which enters the main bile duct passing from the liver into the beginning of the duodenum. Bile is essential to the digestion of fats, and when a meal is eaten a supply of dilute bile moves down the main duct from the liver, whilst more concentrated bile is squeezed into the same duct from the gall-bladder. The bile, both dilute and concentrated, then enters the duodenum to do its work. In cholecystitis, which may be acute or chronic, the walls of the gall-bladder become infected, usually by streptococci or the bacillus coli, and severe pain develops over the liver area, typically spreading back to the right shoulder-blade. If the infection becomes worse and pus is formed there may be a high fever. Gall-stones may, as some physicians believe, be the aftermath of such an infection, although others think that they are formed because of some defect in the ability of the body to deal with fat and cholesterol. In any case, gall-stones are formed in the gall-bladder, and may number anything from one or two to several hundred; their size varies from that of a grain of corn to that of a golf ball. Stones may be present without causing any trouble at all, but usually sooner or later the following symptoms develop: indigestion after eating fatty foods, heartburn, nausea, and attacks of pain. The pain of gall-bladder disease, whether in the case of simple infection or gall-stones, is more or less the same—over the gall-bladder area and passing to the right shoulder-blade. Such pain signifies either infection, which, of course, may occur without stones, or else that a stone formerly lying quietly within the gall-bladder has passed into the bile duct and got stuck.

Typically, gall-bladder disease is found in men and women in middle age, but it is three times commoner in women. As an aid to examinations, students are told (or used to be told) that the typical case is a woman who is "fat, fair, forty, and fertile," for there can be little doubt that pregnancy plays some part in upsetting the secretion of bile in some people. But it is also entirely possible for thin men to develop the disease, so there is no general rule.

When the stone blocks the cystic duct (*i.e.*, the one leading from the gall-bladder to the main duct) there is pain, which may be relieved when the stone either moves back into the bladder or passes into the main duct. The next problem is whether it can negotiate the opening of the main duct into the intestine; for if this duct is blocked *none* of the bile can escape and, passing back into the blood-stream, it produces jaundice.

Operation is necessary when acute inflammation is present, when there are frequent attacks of severe colic and other symptoms causing discomfort, or when jaundice is present. Drugs can cause only temporary relief when a gall-bladder becomes troublesome. There is no such thing as a drug which dissolves gall-stones.

The liver may be the site of cancer, but this is nearly always secondary to cancer elsewhere. Primary cancer, that is cancer originating in the liver, is not common. So, too, the liver may become enlarged, sometimes very considerably so, as a result of events elsewhere in the body: heart failure, leukæmia and other blood diseases, and even rickets can cause enlargement. In the liver itself enlargement may be due to cancer, cirrhosis, abscesses, and cysts (the former usually caused by amœbic dysentery, the latter by parasitic worms; both of which are described elsewhere). Abscesses are usually aspirated—which means that a needle attached to a syringe is passed in and the pus drawn off—cysts have to be surgically removed.

Cirrhosis of the Liver is a condition in which more and more of the liver cells become replaced by fibrous tissue. Now, as we have seen, the whole portal system which carries away the end-products of digestion passes into the liver, so when the liver becomes fibrosed there is serious obstruction to the portal circulation, leading to back-pressure in the veins, and therefore the liquid part of the blood, the plasma, oozes out through the walls into the abdominal cavity. This is known as *ascites*, and it is also found in some cases of heart failure, kidney disease, and chronic peritonitis. Usually the fluid is removed by tapping the abdominal cavity in the same way that one removes pus from a liver abscess.

Cirrhosis is always a serious disease; for, although Nature is so generous as to give us 80 per cent. more liver than we need to preserve life, the common type of cirrhosis extends right through the liver, and the secondary effect of portal obstruction with ascites complicates the matter. The disease is generally associated with alcoholism, especially in those who drink large quantities of spirits (there are other rare types of cirrhosis which need not be mentioned here); but the problem is more complicated than might appear, for everyone who drinks to excess does not develop cirrhosis. In fact, cirrhosis is not at all common, and some seem more liable to it than others. It is believed that another unknown factor is involved and the disease is not due solely to alcohol as such.

Symptoms are: chronic gastritis, morning sickness, constipation. Later, when the portal system has been seriously obstructed, large veins are seen on the abdominal wall, especially around the umbilicus. These develop in an attempt to compensate for the blocked portal circulation. Ascites and slight jaundice are later symptoms. Treatment is a matter for the specialist, but obviously alcohol should be banned. Recently, an operation has been devised in which the portal vein, instead of going to the liver, is sutured to the *vena cava*—the largest vein in the body, which passes up the centre of the abdomen just in front of the backbone on its way to the heart. This operation is known as *porto-caval shunt*.

The Pancreas.

This is a soft, elongated gland lying behind the stomach; it is about 5 in. long and 2 in. wide. Within its tissues lies the duct, which, when it leaves the pancreas, passes into the duodenum near the point of entry of the bile-duct. This

duct transmits the juices containing enzymes which aid in the digestion in the small intestine. The pancreas, however, has two main functions: not only does it manufacture these important digestive juices, but in certain specialised areas, known as the islets of Langerhans, it manufactures insulin. The functions of insulin will be discussed shortly when we are dealing with diabetes.

Like the liver, the pancreas may be the site of cysts or tumours. The only other condition which need be mentioned is *acute pancreatitis*. This is a not very common disease which is caused by a small gall-stone becoming stuck in the opening of the duct. When this occurs, bacteria come in to infect the pancreas, and the blocking of the duct prevents the digestive juices from leaving, with the result that the organ is digested by its own enzymes. There are all the signs of an acute abdominal disturbance: sudden severe pain, vomiting, and fever. Pancreatitis is difficult, even for the expert, to diagnose, and formerly was always treated surgically, but today it is often possible to clear it up with medical treatment and the use of penicillin or other antibiotics.

Diabetes. Although we know so much about diabetes, we still have not the faintest notion as to what causes it. Its immediate cause is a failure in varying degrees of the pancreas to produce insulin, but examination of the pancreas rarely reveals any significant changes. The disease is commonest between thirty and sixty years, but may occur even in children. Now, insulin is the substance which makes it possible for the body to make use of sugar—the glucose which is the end-product of carbohydrate digestion. So in its absence the glucose, although there to be used, is useless to the body and accumulates in the blood, finally passing out in the urine. (The fundamental test for diabetes is the discovery of sugar in the urine by the use of certain simple procedures.) The diabetic, then, is being starved of sugar no matter how much he takes in, and the excess sugar in the blood which cannot be used acts as a poison, which, in extreme cases, sends the patient into coma and may—indeed, in former times, usually did—result in death. The symptoms of diabetes vary, of course, with its severity, but in the main they are: increasing appetite in an attempt on the part of the body to supply the sugar which is there but so tantalisingly unavailable, great thirst, because this useless sugar has to be excreted, and the production of urine demands water, frequency in passing urine, and increasing loss of weight in spite of all that is taken in. In severe and untreated cases boils, itching of the skin, gangrene of the limbs, and finally coma and death may occur.

Although mild cases of diabetes could, and still can, be treated by dieting alone, by reducing the intake of carbohydrate, the diagnosis of diabetes prior to 1922 amounted almost to a death-warrant. In that year, however, the Canadian physicians Banting and Best separated out the secretion of the islets of Langerhans and named it "insulin"; they showed that insulin taken from the pancreas of animals and injected into the diabetic patient was just as effective as the home-made article.

Since a diabetic regime has to be decided on by the doctor according to the severity of the disease, no useful purpose would be served by discussing the details of diet or dosage of insulin, which vary from one person to another. On the whole, diabetes is more severe in young people than in the elderly, but with correct treatment it is possible for all cases to lead a perfectly normal life except in so far as dietary restrictions and insulin injections are concerned. Many famous people are, or have been, diabetics—for example, H. G. Wells—and have lived to a ripe old age. Recently, a drug has been discovered which has the great benefit that, unlike insulin, it can be taken by mouth. Preliminary trials suggest that it can control diabetes; but they are still in the experimental stage.

Whereas the type of diabetes we have been describing, the disease ordinarily known by that name, is properly known as *diabetes mellitus*, there is another disease known as *diabetes insipidus*, which, in fact, has no real relation to the other at all. In this disease there is no sugar in the urine, nor has it anything to do with the pancreas. Diabetes insipidus is a rare disease characterised by the passage of large amounts of dilute urine and appears to be due to deficiency of the secretion of the posterior part of the pituitary gland at the base of the brain. It can be partially controlled by the use of pituitrin.

Peritonitis is an infection of the peritoneum, the thin, transparent lining which covers all the abdominal organs. Acute peritonitis may occur at the end of serious chronic diseases, but more commonly it arises from perforation of some part of the intestines or stomach which allows septic material to flow into the abdominal cavity, or from extension of infection from the Fallopian tubes (the tubes passing between ovaries and womb in women). Wounds of the abdomen are also a possible cause. There is severe pain, vomiting, constipation, fever, and the abdomen is distended. The coils of intestine become matted together by infected lymph, produced by the germs which, while harmless within the intestine, are dangerous to life outside them. Treatment may be by antibiotics or surgery or both.

Chronic peritonitis is usually tuberculous in origin, and is commonest in young children. It is usually caused by the bovine type of bacillus, and usually there is ascites (*i.e.*, free fluid in the abdomen), with slight fever. Matting together of the intestines may threaten to produce obstruction. Unlike acute peritonitis, in which death will occur within two or three days without treatment, chronic peritonitis is a long-drawn-out disease which is usually treated medically.

DIET.

Food is, like alcohol, tobacco, and constipation, one of those subjects which people tend to have a "thing" about. In point of fact, what we know at present about this subject may be summarised as follows: Any diet to be adequate must first of all provide enough energy, and energy is measured in terms of Calories (for definition of a Calorie see **Gen. Inf.**). Thus a ten-stone man leading a moderately active life will require about 3,000 Calories daily; that is the amount of energy he requires in order to carry out his work and avoid living on himself, on his stored-up food. The amount of Calories required varies with age, size, and the amount of work done, from 1,500 Calories for the light-weight sedentary worker to three or more times this amount for the heavy manual worker.

Now, in theory, the adequate amount of Calories could be supplied from carbohydrate and fats alone, since, as we have seen, Calóries are merely a measure of energy and can be supplied by any food. But in this case the individual would not live long, because he needs for body maintenance certain kinds of food in adequate proportions. Just as you cannot run a car for long simply by putting in petrol and ignoring lubricating oil and maintenance of the engine, so you cannot run your body simply by taking in enough Calories. There must be adequate proportions of the three basic foodstuffs: carbohydrates (the fuel), fats (for insulation and other purposes), and proteins (for body-building purposes). Proteins are necessary to replace the parts of the body, which is largely a protein structure, when they become run-down. Fats and sugars can be transformed into each other within the body—this, of course, is why too many sweets make one fat—but proteins cannot be manufactured from these two foodstuffs, since proteins contain nitrogen and the others do not. One could even live on a diet of nothing but protein, but not on a diet of fat or sugar. The ordinary man, or woman, in this country eats a diet which consists of one part of protein, one part of fat, and three of carbohydrate. This is mainly dictated by economic factors, since fats and proteins are dear and carbohydrate foods are relatively cheap.

Here are some foods classified according to the predominating basic foodstuff they contain:

(1) *Carbohydrates*: bread, sugar, and all starchy foods or sweet things such as confectionery, puddings, and cakes.

(2) *Fats*: animal fats, such as dripping, fat meat, fried foods, butter, margarine, and vegetable oils, such as olive oil, or fish oils, which are found more in some fish than others —*e.g.*, herring.

(3) *Proteins*: lean meat, cheese, non-fatty fish, nuts, oatmeal.

In addition to these basic foods, the body must also have adequate supplies of vitamins and certain minerals, such as iron, manganese, calcium, copper, sodium, and potassium.

Obesity. Many people worry because they are overweight, and statistics show that the expectation of life is shorter in fat people than in thin ones. This, however, is a statistical view, and need not apply to any single person. Thus a famous French gourmet who weighed twenty stone died recently at the age of eighty-two—through falling out of a window. When one sees people who are constantly worrying about their health and diet one recalls the statement attributed to Winston Churchill as a recipe for a long life: drink too much, smoke too much, and work hard. He might have added ". . . and stop worrying." There are few people more pathetic than those who, by rigidly adhering to the so-called rules of health, seek to eke out a life which, if it does not actually last longer than that of the more care-free individual, will certainly seem much longer.

Being overweight is due to one cause—eating too much, and especially eating too much of the wrong kinds of food. There are, obviously, some people who can eat to their heart's content without becoming fat, perhaps because their bodies burn up the food more quickly. Their *basal metabolic rate*, which is the measure of the speed at which their body cells work, is higher than normal, and the basal metabolic rate is largely dependent on the functioning of the glands—in particular, the thyroid. Nevertheless, being overweight means that you are eating too much for you; that your intake of Calories is greater than your output.

Reducing is not difficult, but it does require an effort of will. Basically it depends on: (*a*) taking less food, and (*b*) taking food which is not fat-producing. In practice, this means taking a high-protein diet, little fat, and no sugars or starches. Such a diet would be somewhat as follows: coffee or tea with milk, but *no sugar* for breakfast, and if desired some form of crispbread, whether of rye or wheat, but *no white or brown bread.* A small amout of butter or jam may be taken with the crispbread. At lunch, grilled lean steak or an egg dish and salad, followed by jellies or fruit or crispbread and cheese—but *no potatoes.* The evening meal may consist of grilled or steamed fish, clear soup, cheese, fruit, but there must be no fried foods and no sweets at any time. This diet is merely to give an indication of general principles; more interesting ones will be found in the pages of most women's magazines or from time to time in the daily papers. The basic principles are obvious: plenty of lean meat, non-fatty fish, eggs, cheese, fruit, crispbread (or those starch-free rolls which one can buy in some shops), but no fried foods, fat meat or fish, bread, potatoes, sweets, or cakes. However, small amounts of butter and quite a lot of milk are permissible.

Obesity may have a psychological basis, and excessive eating is often a substitute for affection in individuals who have been spoilt as children. But, however this may be, most people find it as difficult to stick to a reducing diet as they do to give up smoking. For such people there are certain drugs which may help. Thyroid tablets, once generally used for reducing, are little used now, and should be used only when the thyroid gland is underactive; otherwise they simply increase appetite, and although they speed up the combustion in the body (the basal metabolic rate), the effect is cancelled out by the increased appetite. Dexedrene, one of the derivatives of benzedrene or amphetamine, acts by reducing the appetite, but in some people of a nervous disposition it may have the effect of causing a feeling of tenseness, and they may even have difficulty in sleeping. Finally, there is a substance obtainable at chemists' shops without prescription either in the form of granules or biscuits which does not exercise any chemical effect on the body; what it does is to swell up into a gelatinous mass within the stomach under the influence of water, which is drunk later, and this gives the impression of a "full stomach" and allays the pangs of hunger.

There are, as has already been mentioned, many fads about food, although one is treading on dangerous ground when one mentions them; for every faddist is a fanatic, and every argument one may put before him is seen as an attack on himself. For example, there was the "Hay diet," now, it appears, largely forgotten; then the "Gaylord Hauser diet" much favoured by Americans, which seems to be based largely on large quantities of molasses and brewer's yeast; and there was not so long ago a gentleman who lived on grass freshly clipped each morning from Hyde Park—it would be interesting to know whether he has survived his self-imposed ordeal. However, few doctors would deny that, although diet in some cases is an adjunct to the cure of disease (for example, peptic ulcer, diabetes, sprue), it is not a cure for disease, and those who make such claims are claiming a great deal too much. It must be repeated that, so long as a diet contains adequate amounts of the basic foodstuffs, adequate amounts of vitamins and the necessary minerals, and so long as it supplies adequate Calories for the build of the individual and the amount of work he does, it matters very little how these needs are supplied.

Vegetarianism.

This can hardly be called a fad, although it cannot be denied that many of its adherents are faddists. It apparently has two main sources. There are those who abstain from animal food for moral reasons because they believe that killing is wrong, even for food; and there are others who believe that vegetable food is more healthy than animal food. Some vegetarians live almost entirely on vegetables and fruits, whilst others allow themselves milk, eggs, and cheese. The moral issue cannot be argued here, although it must be admitted that few people who have visited a slaughter-house for the first time have as much appetite for their steak the day after, so we shall only discuss the health aspects of vegetarianism. On the negative side, it must be said that, in general, vegetable foods are much less rich in protein than animal foods, so one has to eat a great deal more in order to get an adequate amount. If, however, one includes in a vegetarian diet cheese, milk, and nuts or eggs this difficulty is largely obviated. Cows and other animals living on grass or vegetable matter have to spend practically their whole lives eating, precisely because they would not otherwise get sufficient protein. On the positive side we have the recent discoveries that, in predisposed people over forty, excess of animal fats can lead to cholesterol being deposited in the blood-vessels, notably the coronary vessels in the heart, and thus to coronary thrombosis. Vegetable and fish oils do not seem to have this effect, hence the infrequency of thrombosis amongst those peasants in Europe who are too poor to afford much meat, and amongst the Eskimos who eat fish. From the point of view of evolution it would seem that Man is designed to be both carnivorous and vegetarian; for he has sharp, cutting teeth in the front for tearing meat and flat, grinding teeth at the back for dealing with grains. We must conclude that those who are vegetarians for moral reasons should have all our respect; for killing is not a pleasant thing, and we have already too much of it. From the merely medical point of view vegetarianism has both advantages and disadvantages. Nobody will suffer from being vegetarian, but, apart from the exceptions mentioned, there is little reason to suppose that their health will be any better than that of meat-eaters. We are less able to influence our fates than we often suppose, since longevity and good health are much more a matter of heredity than is ordinarily believed.

THE DEFICIENCY AND METABOLIC DISEASES

INTRODUCTION.

If you have read earlier parts of this section you will know that there can be two types of malnutrition; the first, of course, is the type we ordinarily think of when the word is mentioned, and in this case the individual is simply not getting enough food or enough of the right kind of food. The second type might well not be regarded by most people as malnutrition: for here we are referring to diseases such as diabetes and sprue, in which, although there is adequate supply of certain foods, the body, owing to some deficiency, is unable to make use of them. The patient with diabetes cannot make use of sugar, the patient with sprue of fat—they are starving in the midst of plenty, as is shown by the fact that in both cases one of the prominent symptoms is wasting.

We shall deal first with the ordinary type of malnutrition and later with the second. Since diabetes and sprue have already been mentioned, we shall be looking at some other conditions in which something or other is missing or is present in the wrong amounts, as in the diseases of the endocrine glands.

Two-thirds of the population of the entire world are undernourished, and particularly in Asia famines are common—famines like the one in Bengal in 1943, in which 3 million people died of starvation. In Europe such conditions exist only when war dislocates food supplies, but nevertheless individual cases of malnutrition can occur. For example, the lazy or ignorant mother of a large family may feed them largely on bread and margarine, with no fresh fruit or vegetables and only tinned meat because she "can't be bothered" cooking. Or the self-sacrificing mother of a large family may give all the meat and protein food to her working husband (somehow or other many men fail to notice that a housewife works!) and her children. Then old people or people living alone are liable to neglect their food, either because they have lost heart, because they are too frail, or because they cannot afford to buy enough good food. Lastly, those who are addicted to alcohol neglect their food and, drinking on an empty stomach, soon get such a degree of gastritis that they find it difficult to eat even when they need to.

A human being can live about six weeks without food, and a much shorter time—a week or ten days—without water. Naturally, human nature being as it is, there have been many claims to longer periods of starvation, and some of the more enthusiastic claim not to eat at all! Thus, in the sixteenth century Eve Fliegen of Brabant appears to have lived for fourteen years solely on the smell of a rose, and, coming nearer our own time, Mollie Fancher of Brooklyn, who died in 1916, similarly lived for fourteen years without eating, and in 1864 even stopped breathing. However, presumably becoming bored with this, she resumed her respirations after only fourteen weeks.

These people, needless to say, were humbugs, as is revealed by the grim case of Sarah Jacob "the Welsh Fasting Girl," who towards the end of last century allegedly took no nourishment whatever for two years, two months, and one week. The one week, at any rate, is certain; for, at the invitation of the local vicar, who was convinced of her genuineness, a number of doctors from London came to observe her. They put relays of nurses to sit by her bed day and night to note whether she ate, but in a few days she began to decline so alarmingly that the doctors begged the parents to feed her. This they refused to do, and Sarah would not ask for food. She died within a week on December 17th. The most famous non-eater of today is Theresa Neumann, who lives in Bavaria and claims that nothing but the wafer, the Eucharist, at Holy Communion has passed her lips since 1927. The Roman Catholic Church, however, has been careful never officially to recognise her claims as true. So we shall still assert that six weeks, more or less, is the longest period a human being can go without eating.

DEFICIENCY DISEASES

The materials which are necessary to the body have been mentioned elsewhere, and we can now look at some of the diseases (other than those already discussed) which result from their lack.

Lack of iron leads to anæmia, but less well known is the type of deficiency caused by lack of iodine. Iodine is found in large amounts in seaweed, which obtains it from the sea surrounding it and concentrates it in its fronds. But ordinary water contains enough for our needs. In some districts, however, especially where the main rock is limestone—Derbyshire and some valleys in Switzerland and the Himalayas—the water contains very little iodine, and there the inhabitants are prone to develop goitre. There are several types of goitre, but this type is caused by lack of the iodine which is necessary to build up thyroxin, the secretion of the thyroid gland. It is a deficiency goitre known in adults as myxœdema, but in those parts where iodine is lacking in the water supplies the disease develops in childhood and the children become, although perfectly normal when born, dull, gross, and stupid—they become idiots or, as they are more correctly described, cretins. This is one of the commonest types of mental deficiency in children, and, if noted in time, they can become completely normal by the use of thyroxin or thyroid tablets. But prevention is better than cure, and this terrible disease has now been almost eliminated in the districts where it used to be prevalent by adding iodine to the water supply of towns and villages, by giving iodised chocolate at schools, or otherwise supplying the missing element.

In this country cretinism and myxœdema are found in individual cases for reasons other than lack of iodine: in children, cretinism may be due to congenital lack of the thyroid gland or early failure, in adults myxœdema may occur when the gland, usually in the middle period of life, runs down. Both conditions can be treated by thyroid tablets, which, like insulin, have to be taken for the rest of the patient's life.

Lack of calcium is less common in this country than it once was. Calcium is necessary for building the bones: it is calcium, in fact, that makes the bones hard. Actual lack of calcium in the diet is very rare, because calcium is one of the commonest elements in Nature, and what usually happens is that lack of vitamin D or calciferol, without which calcium cannot be utilised or absorbed, causes the deficiency.

The two main diseases caused by calcium, or rather vitamin D, deficiency are rickets and osteomalacia. Vitamin D is found in fats—but only animal fats such as are found in meat, fish, and milk; it is not found in vegetables, plants, or fruit. A second source of the vitamin is sunshine or ultra-violet light, which manufactures it in the skin; hence, in spite of inferior diet, rickets and osteomalacia are perhaps less common in sunny countries. In *rickets*, a child during the period when its bones are developing does not get enough vitamin D and cannot make use of the calcium taken in. Its bones become soft and are liable to bend, producing defects such as bow legs, curvature of the spine, and deformities of the chest (pigeon chest, funnel chest). In bad cases the skull is deformed and assumes a square shape. Rickets is rare today, at least in Britain; it is prevented by taking vitamin-D-rich oils, such as cod- or halibut-liver oil, or the vitamin can be taken in a more or less pure form in capsules.

In these days when diets are adequate, when children get cod-liver oil at home or school, and when they are much more often in the sunshine than used to be the case, it is not always realised that *overdosage* of vitamins, especially vitamin D, is possible. In its extreme form this is a rare condition, but children have died from overdoses which caused calcium to be laid down where it did not belong—in the kidneys and elsewhere. It is possible to have too much of anything.

Rickets is uncommon in adult life because the demand for calcium is less than in the growing child. But in pregnancy the demand increases, and especially in Eastern lands, where famine is frequent and where, although there is plenty of sunshine, the women are veiled from any of the sun's rays, there may occur the disease of *osteomalacia*. In this disease the bones soften and deformities occur which are particularly important in the case of women, in whom the pelvis becomes deformed, with resultant difficulties in child-birth. Osteo-

malacia is a main cause of the high maternal and infant mortality in such countries as India.

In old people who do not get enough food, lack of vitamin D causes no deformity, but leads to the condition known as *osteoporosis*, in which the bones, through lack of available calcium, become brittle and break easily.

Scurvy is another once-common deficiency disease which is now rare except under such unusual conditions (or perhaps not so unusual in these days) as life in concentration camps or amongst prisoners-of-war. It is due to lack of vitamin C, which is found in fruits and vegetables, particularly in lemons, oranges, tomatoes, and turnips. In scurvy the gums swell and bleed, there is increasing anæmia, and spontaneous bruises, due to hæmorrhage under the skin, occur. In former times the disease was the bugbear of sailors and travellers, because on long journeys or voyages before means of preserving food were known other than drying or salting no fresh fruit was available. It was no less a personality than Captain Cook who on his long voyages found that the simple use of lemons or limes would prevent the disease. Hence the almost international description of Englishmen as "Limeys"—a name which is not always used flatteringly, but of which we have every reason to be proud. Minor degrees of scurvy may occur in British children even today through faulty diet, but this is much less common since orange, blackcurrant, or rose-hips syrups became available to all.

We now come to the B group of vitamins. There are, regrettably, many members of the vitamin B family, but we shall mainly deal with vitamins B1 and B2.

Beri-beri is caused by lack of vitamin B1, which is found in most grains, principally in the embryo and the outer covering. Now, since many people are snobs, who prefer white bread to wholemeal and polished rice to the crude article, it has become the habit to remove the precious outer covering of the grain and its embryo which contain the vitamin: white bread and polished rice *look* so much better. Thus, in those parts of Asia where rice is the staple diet, it was frequently machine-milled, with loss of the vitamin, and the result was the serious form of neuritis known as beri-beri. Just as Captain Cook eradicated scurvy from his men by the use of citrus fruits, so, in 1882, Takaki eliminated beri-beri from the Japanese Navy by giving a good mixed diet. This led two Dutchmen, Eijkman and Grijns, to study the disease experimentally. They found that fowls fed on polished rice developed the disease, whereas those fed on rice with the husk did not. In this country we are still in the rather foolish position of carefully removing the vitamin by "refining" the flour and then replacing it chemically. However, although whole-meal bread is probably better, there is really little risk of any European diet lacking vitamin B1.

The symptoms of beri-beri are neuritis (*i.e.*, degeneration of the nerves), which leads to weakness of the muscles, wasting, and sensations of "pins and needles"; the heart muscle is also affected and œdema—swelling of the limbs—or ascities (fluid in the abdomen) occurs.

Pellagra. Vitamin B2, or rather the vitamins of the B2 group, of which the main ones are riboflavin and nicotinic acid, is another substance deficiency of which in this case leads to pellagra. Pellagra is found in those parts of the world where maize is a staple diet, that is in parts of America and the Far East and round the Mediterranean. Maize does not contain the vitamin which, like vitamin B1, is found in most other grains and vegetables, but, since vitamin B2 is also normally produced by the action of bacteria in the human colon, it would appear that there is some other factor than the mere absence of the substance from the diet. Probably maize contains a substance which prevents the absorption of the vitamin from the colon.

In pellagra there is wasting, soreness of the mouth, diarrhœa, skin rashes on the hands, forearms, face, and neck. In severe cases insanity may occur. The disease does not occur in this country in its full-blown form, but minor degrees may develop with the use of certain antibiotics, such as chloramphenicol and aureomycin, which kill the "good" vitamin-producing bacteria in the intestine as well as the disease-producing ones.

Vitamins.

Whereas vitamins B and C are found mainly in vegetables and fruits, vitamins A and D are found in oils and fats. Vitamin A is, indeed, found in the form of carotene in all green vegetables, but it is not much use to us until it has become concentrated in the fat and milk of the animals who eat the vegetables. Lack of the vitamin leads to *night-blindness*, to difficulty in seeing in the dusk. This is because the retina, the "mirror" at the back of the eye, requires adequate amounts of a substance known as visual purple for its full efficiency, and visual purple is manufactured from vitamin A. (It must be noted, however, that not all cases of night-blindness are due to lack of vitamin A—there is often a very large neurotic element, and it was frequently found during the War that men who on this account pleaded their inability to carry out sentry duties at night might show a very considerable talent for seeing their girl-friend at the camp gate even in pitch darkness.) Vitamin A is also connected with the health of the skin and the ability of the body to resist diseases of the respiratory tract such as bronchitis. Like vitamin D, it is most easily obtained from fish oils, such as halibut-liver oil.

Lesser-known vitamins are vitamins E and K. The former, found in wheat-germ oil, influences fertility; the latter influences the clotting power of the blood and the healing of wounds. Most vitamins can now be produced in the laboratory synthetically; in the case of vitamin B1 from coal-tar.

It is important to realise that vitamins, although necessary to health, are not cure-alls. There are few sights more ridiculous than the fad of over-fed individuals taking vitamin pills as a tonic to keep themselves up to scratch. Any vitamins taken in excess of requirements may either cause damage—as in the case of vitamin D—or else are simply excreted from the body. Extra vitamins are not a tonic, those who take them in excess are simply wasting their money, and if one eats a good mixed diet they are totally unnecessary.

GLANDULAR DISEASES.

The Endocrine Glands.

The workings of the body are regulated in all sorts of different ways—by the nervous system, the circulation, and by the endocrine glands or ductless glands, as they are sometimes called. We have already seen that there are glands, such as the liver (the largest gland in the body) and the pancreas, which manufacture substances and pass them through a duct or tube to their destination. But the ductless glands, as their name implies, have no duct and pass their secretion directly into the blood; the pancreas, for example, discharges the pancreatic fluid down a duct, but it also produces insulin, which is secreted directly into the blood. It is thus partly an endocrine gland and partly an ordinary one. The other endocrine glands are particularly important in that they produce hormones (the word means "chemical messenger"), which have a great deal to do with personality and health.

Myxœdema, we saw, is due to lack of thyroid hormone either because the gland, which is situated at the base of the neck astride the windpipe, has failed or because it has insufficient iodine to manufacture its product. The opposite effect occurs when the gland becomes overactive, and then we get a quite different state of affairs: instead of being dull, slow-witted, and flabby-looking, the patient with an overactive gland—*exophthalmic goitre* or *thyrotoxicosis* is excitable, nervous, flushed, and thin. The eyes become prominent and bulge forward, giving a staring,

scared look. The disease is commonest in young adults, mostly women, and there can be little doubt that what usually sets it off is an emotional shock. Thyrotoxicosis is not primarily a disorder of the thyroid gland, and it is believed that the sequence of events is: emotional shock, which influences the nerves supplying the pituitary gland at the base of the brain, overactivity of the pituitary with overproduction of the hormones, which in turn affect the thyroid. (The pituitary is the main endocrine gland in the body and gives off hormones which control all the other glands—it has been called the "conductor of the endocrine orchestra.") All the body processes—the basal metabolism—are speeded up in this disease, which, however, cannot be treated at its roots in the pituitary. Sometimes it can be treated medically by the drug thiouracil, which damps down the activity of the thyroid, but more usually an operation is necessary to remove part of the gland. It is also possible in suitable cases to give the patient radioactive iodine—a radio-isotope which is carried, as all iodine is, to the gland, where it destroys some of the overactive tissues. The results of these procedures are good, but any exophthalmos, the prominence of the eyes, which may be present always remains.

A similar condition, appearing in middle age, may result, not from shock or from an overall enlargement of the gland, but from a *toxic adenoma*, which is a simple, non-malignant tumour. In this case exopthalmos does not occur, but the tumour should be removed.

The Parathyroid Glands.

We have already discussed the importance of calcium in the body and seen how vitamin D is necessary for its utilisation. But the calcium content of the body is controlled by another factor, the parathyroid glands—two pairs of small glands lying behind the thyroid. Now, calcium, in addition to building the hard structure of bones, has another function in that it acts as a kind of sedative, damping down the nerves and preventing overexcitability. When the parathyroid glands do not work properly, or when they have been partially removed during a thyroid operation, *tetany* (not to be confused with tetanus) arises. The hands and feet go into spasm and there may be generalised convulsions. Tetany can be produced in a number of other ways which influence the amount of calcium in the blood: for example, alkalosis when people have taken too much alkali for stomach disease, or when they have lost acid through persistent vomiting, or even by overbreathing—*i.e.*, persistent deep and rapid breathing, which causes the body to lose carbon dioxide—a condition which may occur in hysterical or neurotic patients. The treatment is to give large amounts of calcium and vitamin D.

Overactivity of the parathyroid glands, usually due to a tumour, causes the reverse effects. The blood calcium is high, but this calcium has been withdrawn from the bones, and a disease known as *generalised osteitis fibrosa* arises, in which the bones become soft and there is pain, fractures, and deformities. Sometimes cysts form in the bones. The treatment is operative removal of the tumour.

Salt is very important in the running of our bodies. Indeed, our blood has been described as an "inner sea"; for, whereas primitive creatures in the ocean, such as sea-anemones and sponges, get their sustenance from the sea surrounding them and do not need a blood-stream within, in the course of evolution the situation gradually changed. As sea-animals grew bigger, the water outside did not suffice, and they had to develop some sort of circulation within; even more so, when they developed into land animals they had to carry their sea about with them. Loss of the salt in this inner ocean is occurring all the time, both through the urine and through sweating. Workers who do heavy jobs in a hot atmosphere lose a great deal of salt through sweating, and if afterwards they drink a great deal of water the remaining salt in the body becomes even more diluted, with the result that they will get painful cramps. Similarly, diarrhœa or prolonged vomiting can bring about the same result through loss of salt from the body. After long periods of exercise it is much more refreshing to take water with added salt than to take pure water, which will increase rather than diminish our fatigue.

Suprarenal Glands.

A glandular disease which influences the balance of salt in the body is *Addison's disease*, named after the famous English physician who first described it. This disease is characterised by great weakness of the muscles, tiredness, loss of weight, low blood-pressure, and a brown pigmentation of the skin. Until recently it was always fatal. Addison's disease is caused by damage to the suprarenal glands, two small glands which sit one on top of each kidney like little cocked hats. These glands produce a number of hormones, one of which controls the excretion of salt from the body; if it is lacking, too much salt escapes, with the results described above. The disease is now treatable by the use of cortisone, one of the suprarenal hormones.

These glands consist of an inner part or medulla which secretes a hormone known as adrenalin—the substance which, when released into the blood, prepares us for states of emergency. It reinforces states of anger or fear, and aids in the process of fighting back or running away. The cortex (the word means "bark of a tree"), on the other hand, secretes a number of hormones, one of which, as we have seen, is connected with the salt content of the body and another which plays some part in sexual development. Thus a tumour of this area may bring about a state of *hyperadrenia*, in which excessive secretion leads to premature or excessive development of masculine sexual traits. Boys show precocious sexual development, their voice breaks, and their muscular development increases. Girls assume male characteristics. This is known as the *adreno-genital syndrome*.

The Pituitary Gland.

The pituitary gland, lying at the base of the brain, is only about the size of a small cherry, yet it not only regulates the behaviour of all the other glands but is responsible for sexual development and growth. It consists of two parts, the anterior (which does all the interesting things), and the posterior, which secretes a hormone known as pituitrin, thus raising the blood-pressure and causing the muscle of the uterus to contract. Many conditions are described in which the anterior part of the gland either produces too much or too little of its hormones. For example, when this part overacts in early life the result is a giant—*i.e.*, anyone over 6 ft. 8 in. In later life, when the bones are set, the result of overaction is *acromegaly*, in which the face is elongated, the hands are relatively huge, as also are the feet. The head, too, is large, and the patient gives a somewhat gorilla-like impression.

When the anterior part of the pituitary underacts there are many unpleasant possibilities: the individual may develop into a fat boy, like the one in *Pickwick Papers*, sleepy, greedy, and monstrously fat; or into a human skeleton who appears to have hardly any flesh at all; or there may develop painful masses of fat in the wrong places, a condition described as *adiposis dolorosa*; or again, dwarfism may result and the individual retain the appearance and size of a child with normal adult mentality. These conditions are known by the various names of *Frölich's syndrome* in the fat-boy type, *Simmond's disease* in the human skeleton, *Dercum's disease* in the case of adiposis dolorosa, and *Lorrain's disease* in the case of dwarfism.

The Sex Glands.

In women these are the ovaries, and in man the testes. The ovaries produce two hormones, one of which, œstrin, brings about, under the influence of the pituitary, the normal sex changes at puberty, controls the release of the ovum from the ovary, and, in animals, produces sexual excitement. The other, also controlled by the pituitary, is progesterone, which in general has a sedative

effect: it prepares the uterus for pregnancy, and, when a pregnancy exists, maintains it.

The internal secretion of the male sex glands is testesterone, and it, like œstrin, produces the sex changes at puberty. The problems of sex, however, will be discussed later.

DISEASES OF THE URINARY SYSTEM.

Everyone knows what kidneys look like—in fact, the term "kidney-shaped" is used to describe other objects. Within the kidneys the blood-vessels carrying waste materials subdivide and finally end up in little coils or glomeruli through which waste products are filtered into the other system, the system of tubes which, beginning as tiny cups around the glomeruli, become larger and larger until they join the ureter passing out at the root of the kidney, the hilum, a point at which both the veins and tubes enter and leave. The kidneys, of course, lie one on each side in the loins, so that if one puts one's hands on the hips and then slides them farther back they will cover the area over the left and right kidney. The ureters pass down on each side to the bladder, which is the storage tank of the products excreted by the kidneys, and lies in the mid-line low down in the abdomen; it is somewhat pear-shaped, and at its base in men there lies the prostate gland—a gland which apparently has few functions but can be a nuisance. Its only known function is that it adds something to the semen from the testes without which the semen would be sterile. Then, from the base of the bladder a single tube, the urethra, passes to the outside. One can, in fact, visualise the urinary system as a capital **Y**, in which the two upper limbs are the ureters, the place where they meet is the bladder, and the single limb at the foot is the urethra. Clearly, then, there may be diseases of the kidneys, of the ureters, of the bladder, of the prostate gland, or of the urethra.

The amount of urine may be increased or diminished. It is *increased* in the following conditions: after drinking excess of fluids; after taking drugs (known as *diuretics*) which are given to increase the flow; in diabetes of both types—mellitus and insipidus; in some types of chronic kidney disease; and finally, in emotional states of excitement. It is *decreased* in the following conditions: acute nephritis; any disease in which fluid is being lost in other ways, such as diarrhœa or sweating in fevers; when the fluid intake is small; and when both ureters are blocked by stones. Passing a great deal of urine is known as *polyuria*, passing very little as *oligouria*, passing frequent small amounts is simply called *frequency*. Normally, the urine is acid, but in infections of the bladder it may become alkaline owing to decomposition by bacteria. Abnormal substances, or normal substances in abnormal quantities, may occur in the urine and give the doctor an indication of what is wrong. In fact, urine analysis is a very important part of medical diagnosis. Thus urea is a normal content of urine which is increased in fevers, wasting diseases, or diabetes; the amount of urea is to some extent a measure of the degree of tissue breakdown. Uric acid is found in small quantities in normal urine, but the amount is increased in fevers and after an attack of gout (uric acid plays some part in the causation of gout, but has nothing at all to do with rheumatism in general, so one may disregard the advertisements in the popular Press showing unpleasant pictures of joints with sharp crystals of uric acid which are alleged to cause the pain of rheumatic disease). Oxalates are not ordinarily found in urine, but, since they occur in such foods as rhubarb and strawberries, and some people are unable to deal with them, such individuals may develop stones or have pain on passing urine after eating oxalate-containing fruits.

Two very important substances which ought not to be in normal urine are albumen and sugar. Albumen is a protein, and its presence in the urine indicates that the filters of the kidney are leaking—they are allowing protein to pass out which ought to remain in the body. Albumen is easily tested for, and its presence may indicate kidney disease or nephritis as it is usually called by doctors. On the other hand, small amounts of albumen occur in fevers and in nervous conditions—*functional albuminuria*. Sugar, too, should not be present, but its presence does not necessarily indicate diabetes; for small amounts may occur in nervous conditions or in some people after taking large quantities of carbohydrate.

Blood in the urine may give it an appearance which varies from bright red to a dark, smoky colour. It is found in many diseases: acute nephritis, stone, tumours, poisoning by certain drugs, infections such as bilharzia or malaria, papilloma (*i.e.*, non-malignant tumour of the bladder), after injury, in high blood-pressure, scurvy, and blood diseases. Sometimes it occurs for no known reason at all.

It will be remembered (or if it is not, you can look it up on p. 28 (1)) that streptococcal infection of the throat may cause in some people disease of the valves in the heart or endocarditis. In such cases, although the germ is found in the throat, it is not found in the heart or indeed anywhere else in the body. *Acute nephritis* occurs in the same circumstances, with the sole difference that the kidneys instead of the heart are affected. The disease appears to be an allergic reaction to the toxins of the streptococcus. The patient, often a child, has a sore throat (and even this may be absent or fail to be noticed) or sometimes the infection may arise in other sites: after scarlet fever, erysipelas, burns, and disease of the ear. A few days later there is headache, vomiting, pain in the loins, slight rise in temperature, and especially typical is *dropsy* or œdema. This begins in the face, first around the eyelids, and then affects the ankles; later it may become more general and affect the rest of the body. Blood and albumen are found in the urine, and the blood-pressure is slightly raised. The outlook is usually good if the kidneys are rested by reducing the amount of protein taken in and also the amounts of salt and water. When this is done, the inflammation soon goes and no permanent harm results. In other cases, however, if treatment is inadequate or the condition severe, the symptoms may go, but the albumen found in the urine persists. This means that permanent damage has been done, and although there may be nothing else to show for many years, *chronic nephritis* develops. In this case, the blood-pressure continues to rise, and since the filters of the kidneys no longer work efficiently, urea, the principal waste-product of the body to be excreted in the urine, is retained in the blood and only small amounts escape from the system. Hence chronic nephritis sooner or later leads to heart failure or hæmorrhage in the brain from the rising blood-pressure, or to the form of poisoning known as *uræmia* which results from the retention of urea in the blood. Uræmia may come on suddenly or gradually, but ends in progressive coma, drowsiness, and unconsciousness. There may be convulsions similar to those of epilepsy, high fever, and difficulty in breathing to complicate the picture.

Another type of nephritis which seems to have nothing at all to do with streptococcal infections, and the cause of which is completely unknown, is *nephrosis*. Developing in early adult life, its onset is insidious, and the patient first shows signs of œdema in his white and puffy face and the swelling of his legs. (It should be said here that if you have swelling of the ankles or elsewhere, you would be foolish to jump to conclusions; for such swelling is common in many diseases—in heart disease, in allergic conditions, in neurotic illness, and even just from hot weather.) When the urine is examined in a case of nephrosis it is found to be full of albumen and, as in chronic nephritis, the blood urea starts to rise. Ultimately, the end-results of nephrosis are the same as those of chronic nephritis, so the outlook is not good. Of course, all these diseases must be treated by a doctor, but it must be realised that damage done to the kidneys is irreversible.

Pyelitis is an infection of the pelvis of the kidney, that is to say, of the part where the ureter leaves the kidney. It is usually caused by the bacillus coli, which is normally present in the body, or by the streptococcus. These germs may reach the ureter through the blood-stream or may

pass upwards from the bladder. Obstruction anywhere in the urinary tract which causes the urine to stagnate is liable to cause pyelitis. Symptoms come on suddenly, with high fever, pain in the loin (the infection is usually on one side only, and is commoner in women), and pain in the abdomen. When urine is passed there is a burning sensation, and it is passed frequently and in small amounts. On examination, the urine is found to be highly acid and full of bacillus coli or whatever the causative germ may be. Pyelitis is fairly readily treated by the antibiotics or sulpha drugs. Plenty of fluids should be given and the urine made alkaline by administration of alkalis.

Cystitis means inflammation of the bladder, either acute or chronic, and its causes are much the same as in the case of pyelitis. There is pain over the lower abdomen, frequency, and sometimes slight fever. The treatment is as for pyelitis. *Urethritis* is an inflammation of the urethra, with burning pain on passing water and frequency. The most serious cause (although it can usually be easily dealt with now) is gonorrhœa. But non-specific urethritis is common, and in this case various germs or none may bring about pain and frequency; there is often a large neurotic element. Urethritis should be regarded as probably due to gonorrhœa, which has already been discussed elsewhere, when there is a thick, creamy discharge from the penis or discharge in women following sexual intercourse with an infected person.

Kidney stones or Renal calculi sometimes form, and, as in the case of gall-stones, what causes them is not certain. They may be caused by disorders of metabolism—that is, in the inability of the body to deal with calcium, proteins, uric acid, and other products; or by vitamin deficiency, obstruction in the urinary tract, and urinary infections. But when a stone or stones are formed various events may occur: thus it may remain in the kidney and cause no symptoms; or it may cause repeated attacks of pain, infection, and blood in the urine (hæmaturia); or it may completely block the passage of urine from the kidney to such a degree that it degenerates and becomes useless; or, lastly, it may pass into the ureter, and when this occurs very severe pain, known as *renal colic*, will occur. A stone passing down the ureter into the bladder may become stuck in the urethra, although this is uncommon, since a stone small enough to get down the ureters is likely to be capable of manœuvring through the rest of the tract. In fact, about 80–90 per cent. of stones are passed spontaneously. Stones not passed spontaneously may have to be removed by operation, but whether this is undertaken or not depends on various factors, such as the general health of the patient, the amount of trouble caused by the stone, and the health of the other kidney —for it is dangerous to operate on one kidney unless one is sure that the other is functioning efficiently.

If a stone blocks the passage of urine on one side for any length of time *hydronephrosis* may result, in which the part where the ureter enters the kidney swells with the retained urine. Ultimately much of the kidney may be destroyed by the back-pressure. The same effect may be produced by kinking of the ureter or anything else which causes obstruction. Sometimes children are born with hydronephrosis, and when the dilation is due to kinking of the tube the condition may be intermittent, with attacks of renal colic during which only small amounts of urine are passed; this is followed with relief and the passage of large quantities.

Tumours and Cysts. The kidney may also be the site of tumours and cysts which produce pain in the loins, sometimes a lump over the kidney which can be felt, and blood in the urine. Cancer of the bladder is a serious condition in which the bladder may have to be removed, so the urinary flow has then to be directed elsewhere. Either the ureters are brought out on to the skin surface, a procedure known as *cutaneous ureterostomy*, or they are implanted in the large bowel, so that the urine flows out with the fæces. This is described as *uretero-colostomy*.

There may also be benign tumours of the bladder or *papillomas*, which are soft and bleed easily; a great deal of blood is passed, but there is usually little or no pain. In this, and similar, diseases of the bladder examination of the inside of the organ is carried out by means of a cystoscope, a thin tube which is passed up the urethra and has a small electric light at the end which enables the surgeon to see what is going on. Instruments may also be passed through the tube, and simple papillomas can be cauterised. Similar instruments are used in the examination of the stomach (gastroscope) and the bronchial tubes (bronchoscope). When some obstruction in the outlet of the bladder or in the urethra occurs the bladder, of course, fills with urine, which cannot be passed, and very painful dilation occurs. In this case an attempt may be made to pass a catheter, a thin rubber tube, into the bladder to relieve the tension, or if this fails a *suprapubic cystomy* is performed—an incision is made in the abdomen over the bladder and a tube inserted into it, through which the urine escapes. This is ordinarily a temporary expedient, and later when the patient's health has improved an attempt will be made to remove the cause of obstruction. The most common cause of such obstruction is *enlargement of the prostate gland* at the base of the bladder, which surrounds this area and the beginning of the ureter. About 40 per cent. of men over sixty have some degree of obstruction due to this cause, and about 20 per cent. of these require operation. The gland is about the size of a walnut, and, as we have seen, its function is to supply part of the fluid which makes up the semen, the male sex secretion. Enlargement of the prostate may be benign or malignant, and, although nobody knows just why, such benign enlargement tends to occur in most men in later life. There may be no symptoms, but characteristically there is frequency during the day and the need to get up at night to pass water. The flow of urine being impeded by constriction of the urethra, the passage is less forceful than normal, and there is a tendency for dribbling to occur. If the obstruction is severe and not relieved the back-pressure may be transmitted to the ureters and kidneys, resulting finally in kidney failure and uræmia. The prostate, except in cases of very mild enlargement, has to be removed either through the abdomen or through the perineum (the part of the body lying between the sex organs and the anus). Sometimes, in less serious cases, it is possible without an incision to cut away the obstructing part by an electrocautery inserted, as is a cystoscope, through the urethra. Prostatectomy was once a serious operation, all the more so because the patient was usually elderly and not in good condition, but new techniques and the use of antibiotics have greatly improved the outlook.

Cancer of the Prostate is always serious, but if discovered in time it can be operated on successfully. The gland, of course, has to be completely removed; in inoperable cases, or in patients unfit to stand operation, the tumour may be treated by means of female sex hormones, which cause it to shrink and may prolong life by some years.

DISEASES OF THE NERVOUS SYSTEM.

The brain and nervous system are like a telephone exchange which sends out and receives messages from the rest of the body. Essentially it consists of two levels, the lower centres, where primitive emotions are felt, the viscera controlled, and simple actions initiated, and the true brain, which holds the lower centres under control. When, for example, one is pricked with a pin, a message is passed up the nerves (the sensory nerves or nerves of feeling) through the spinal cord to the lower centres, which return a message through the motor nerves (the nerves dealing with movement), causing the hand to jerk away. All this takes place without any conscious interference, and can, in fact, happen even when the true brain has been removed. It is, of course, possible for the movement which jerks the hand away to be inhibited, because in this case the brain intervenes; all mental life is a constant interaction between the lower and higher centres.

When we become angry, for instance, the anger originates in the lower centres, but may be inhibited by the higher ones. To some extent, the former correspond to what a psychologist would describe as the unconscious mind, the latter to the conscious mind.

The nervous system is made up of nerve cells which are smaller than the head of a pin but end in a long, thin fibre, which may be several feet long. These fibres form the nerves of the body, and they end in the motor nerves, which bring about muscular movement, or in the skin, where there are separate nerve-endings dealing with pressure, heat, cold, pain, and so on. It used to be supposed that there were areas in the brain dealing with such mental faculties as acquisitiveness, conscientiousness, and other abilities; but this is known to be quite untrue. There are, indeed, areas dealing with movement, sight, hearing, speech, feeling, and thought, but certainly none dealing specifically with the more complex mental faculties. Nor is it correct to suppose that each nerve cell carries some particular thought or feeling; for it appears that thinking and feeling are represented by nervous circuits in the brain and are not isolated in any special area. Thus large parts of the brain can be removed without interfering with mental activity.

The most primitive part of the nervous system is the autonomic nervous system, which has its "brain" in the hypothalamus at the base of the true brain. It is divided into two parts: the sympathetic nervous system, which supplies the viscera with impulses which prepare the body for flight or fight (causing the heart to beat faster, the muscles to become congested with blood, the skin to become pale, and the blood-sugar to rise whilst the intestines become less active), and the parasympathetic nervous system, which, in general, produces relaxation. When the parasympathetic system acts, the heart beats more slowly, the skin becomes flushed, the intestines digest food, and the body is prepared for rest. Since, as we have seen, the lower centres are the centres controlling both emotion and the internal organs, it is clear that emotional states will influence the action of the body. This is the basis of psychosomatic medicine.

The brain and the spinal cord, which passes down the bony canal within the spine, are covered with the thin layer of tissue known as the meninges and surrounded with cerebro-spinal fluid, which is also found in the cavities of the brain known as ventricles. A specimen of cerebro-spinal fluid, or C.S.F., may be removed by pushing a hollow needle between the vertebræ in the lumbar region, and such specimens can give a great deal of information about what is going on in the nervous system.

The diseases of the nervous system can be divided into various groups: there are those due to injuries, such as fractures of the skull or divided nerves; the infectious diseases, most of which have been discussed already; the diseases due to hæmorrhage or embolism; tumours; and, perhaps the biggest group, the degenerative diseases.

The blood-vessels of the brain are one of the common sites of *aneurisms*, bulges like small berries, often at the base of the brain, caused by weakness of the vessel wall. This is sometimes the result of arteriosclerosis, syphilitis infection, or injury, but perhaps most often the aneurisms are congenital—*i.e.*, the individual is born with them. There are usually no symptoms, although if the aneurism is large enough it may press upon other structures and cause symptoms recognisable by the specialist. In most cases the diagnosis is apparent only when the aneurism, as may occur, ruptures. When this happens the symptoms are those of brain hæmorrhage. There is severe headache, vomiting, and loss of consciousness, the patient breathes heavily, and when the doctor does a lumbar puncture the C.S.F. is stained with blood. Such an event is very serious, and ordinarily all that can be done is to rest the patient; nevertheless, over 60 per cent. of cases are fatal.

When, in the few cases in which symptoms occur *before* hæmorrhage, the presence of an aneurism is suspected, this may be confirmed by X-ray. Since soft tissues are not seen in X-ray pictures, it is necessary (for example, in the gall-bladder, the kidneys, the bronchi, or the blood-vessels of the brain) to inject some radio-opaque substance which outlines them. In the brain this is known as arteriography, and when by this means aneurisms or other abnormalities are found surgery is sometimes possible. Hæmorrhage into the brain substance produces what is generally known as a *stroke*. The artery affected is usually the middle cerebral, when in later adult life it has been strained and weakened by high blood-pressure or arterosclerosis. It can, however, be caused by bleeding into a tumour, or in children by birth injuries. Hæmorrhages may also result in the small veins from the strain of coughing in whooping cough.

A stroke comes on suddenly, and the patient is flushed with a bluish tinge. He breathes heavily and, as he breathes, the cheek on the affected side may be blown in and out. Since the left side of the brain supplies the right side of the body, and *vice versa*, the side of the body on the opposite side from the hæmorrhage is paralysed. The limbs and face right down the affected area are flaccid and useless, but if the patient survives they will at a later stage become spastic. There are, therefore, two types of paralysis: flaccid and spastic. In the first, the limb is incapable of movement, and when lifted it falls back like a dead weight; there are no reflexes, so that when the knee-cap is tapped to elicit the knee-jerk there is no response. Flaccid paralysis is typical of injury to the lower parts of the nervous system, and it means that no impulses are getting through. Spastic paralysis, on the contrary, is characterised by rigidity of the limb, overactive reflexes, and even when movement is possible it is out of control. This, in fact, is what has occurred; for spastic paralysis indicates that, although the lower nerves are undamaged, the controlling centre in the brain has been affected.

If the patient survives, there may be varying degrees of improvement in the paralysis, which is always at its greatest in the beginning.

When such an emergency occurs it is best to leave the patient where he is, keep him warm, take out his dentures if any, call the doctor, and on no account to give him any fluids or alcohol. No patient in coma should ever have fluids poured down his throat. Other causes of coma are diabetes, alcohol, uræmia, acute hypertensive (high blood-pressure) attacks, and thrombosis or embolism.

In thrombosis and embolism a similar picture to that of hæmorrhage occurs. Embolism comes on suddenly like a hæmorrhage, but in thrombosis or clotting the onset may be more gradual, with premonitory symptoms of headache, giddiness, and numbness or pins and needles in the limbs. There may be difficulty in speaking.

Tumours and Abscesses. The brain is soft, greyish white in colour, and from the upper surface closely resembles a huge walnut in that it has two sides joined across the middle by a smaller part known, in the brain, as the corpus callosum. It resembles a walnut, too, in that its surface is crumpled up into convolutions. Investigation of the brain has become more and more refined in recent years, the following being some of the techniques employed:

(1) Straight X-rays.

(2) Arteriograms, which have already been described.

(3) Encephalograms or ventriculograms, in which some of the fluid, the C.S.F. surrounding the brain or in the cavities known as ventricles within the brain substance, is removed and replaced by gas. The gas may be helium or oxygen, and it has the effect in an X-ray picture of outlining the brain and ventricles so that any distortion of shape due to a tumour or abscess is outlined.

(4) Electroencephalograms are pictures made of the electrical brain waves produced by the brain, just as the electrocardiograph takes pictures of the similar waves produced by the heart. Electrodes attached to the scalp may show abnormal waves over the site of a tumour or abscess.

(5) Still more recently, radioisotopes have been used to locate tumours, since radio-

active substances become concentrated in the area of the abnormal tissues.

The main symptoms of brain tumour are severe headache, vomiting, and disturbances of vision; such symptoms must be referred to a doctor at once. The pulse-rate is usually slow. All these symptoms are caused by increasing pressure within the brain because of the space taken up by the tumour.

The popular belief that a brain tumour is tantamount to a death warrant is simply untrue; for at least 80–90 per cent. of cases recover. The main types of tumour are meningiomas (*i.e.*, tumours of the brain coverings or meninges); tumours of the nerve fibres within the brain or neurofibromas; tumours of the pituitary gland; and gliomas, which are tumours of the brain substance. The outlook for all of these is good, except in the case of the glioma, which is a type of tumour which tends to infiltrate into the substance of the brain fairly rapidly. It is not localised, and therefore complete removal is not always possible.

Brain abscesses may be spread from the bloodstream in people with bronchiectasis, osteomyelitis, infected sinuses, or chronic ear disease. The symptoms are similar to those of tumour, but there is also fever and drowsiness.

Aphasia is a disturbance of the ability to speak, write, or to understand spoken or written words. It is usually due to a tumour, abscess, thrombosis, or embolism of the speech area in the brain. In motor aphasia the muscles of speech are normal, but the patient is unable to speak intelligibly. In nominal aphasia the patient cannot name objects, which he nevertheless is able to recognise. In agraphia the patient cannot write, although his muscles are normal. In word-blindness and word-deafness the patient cannot understand written or spoken words respectively. Treatment depends upon the cause, but in hopeful cases re-education is sometimes possible.

Headaches. This seems a convenient point to say something about headache, which must surely be one of the commonest symptoms suffered by the human race. We shall begin by noting that at least 90 per cent. of all headaches are nervous in origin or the result of such other minor troubles as gastric upset. It is doubtful whether headache is as frequently brought about by eye-strain as is often supposed, but there is certainly no harm in having one's eyes tested if frequent headaches are present.

A doctor will first try to distinguish between headaches due to mental causes and those due to organic or physical ones. When the cause is physical the headache is often very severe, usually located sharply in one area (for example, on one side of the head), and it is likely to be accompanied by other symptoms, such as vomiting and eye-disturbances. The person with this type of pain often tries to minimise the pain he suffers, but his behaviour—for example, his obvious fear of moving his head—belies him. The neurotic person, on the other hand, suffers from headaches which are "terrible," "awful," "unbearable," vague in their location (they are "all over"), and, if they are accompanied by other nervous symptoms, the diagnosis is clear. Apart from the neurotic type, headaches are caused by migraine, increased pressure within the skull, as in brain tumour or abscess, sinus disease, and eye diseases. Treatment obviously depends on the cause, and the sensible thing to do is to go to a doctor, believe what he says, and take his advice. Neurotic headaches may be dealt with by investigation of the sources of worry, frustration, and so on which cause the pain, or by taking aspirin or other pain-relieving drugs. (Pain, in fact, is one of the very few things aspirin is good for, and as has already been said elsewhere, those who believe that it is good for "nerves," insomnia, and all the various conditions which make aspirin an almost universal cure in the minds of many, are deluding themselves.)

Migraine is a disorder which many claim to possess and not so many really do; if all the people who claim this dubious honour—often those who have little better to do than be bored with themselves—if all these were put end to end, or even stood upright in a line, they would surely encircle the Earth. True migraine, however, is a very clear-cut disease, and happens in a very definite type of person. The owner of the migraine tends to be a highly intelligent and conscientious—even over-conscientious—individual (not at all like Mrs. Jones, who says she suffers from it and could by no stretch of the imagination be described either as intelligent or over-conscientious). The headaches are severe, usually on one side of the head only, occur in periodic attacks, and are not, like the headaches suffered by Mrs. Jones, "there all the time." Vision is affected so that there may be hemianopia (*i.e.*, half-vision), flashes of light before the eyes, and the so-called fortification spectra (*i.e.*, zig-zag patterns in the field of vision). The pain is often prostrating, and is usually followed by attacks of vomiting. Migraine is a mystery disease which apparently has something to do with the personality, with emotional stresses, and conceivably in some cases with allergy; the actual pain appears to be caused by spasm of the blood-vessels in the brain. The usual treatment is with tablets of ergotamine (Femergin), but other remedies are also helpful in different cases.

There are a number of other nervous diseases the cause of which remains a mystery, and of these we shall mention epilepsy, chorea, and pink disease.

Epilepsy is a disease which has troubled many famous men—it has been attributed to St. Paul, Julius Cæsar, Napoleon, and (with more justice, perhaps) to Dostoievsky. Epilepsy manifests itself in various ways, the common type being *grand mal* seizures, in which the patient falls down unconscious, his muscles become tense, his jaw clenched so that he is in danger of biting his tongue, and his body is rigid all over. This is known as the tonic phase, and it is followed by the clonic phase, when, within a minute or so, the limbs begin to contract rhythmically. As this phase passes away the patient lies limp and gradually recovers consciousness. Often he does not know what has happened. Sometimes he is confused, forgets where he is, and wanders away in an attack of loss of memory (amnesia or epileptic fugue). In *petit mal*—the name means the little sickness—the attack may be hardly noticeable. The patient is perhaps talking or doing something, when without any warning he simply stops, looks dazed or confused for a brief period, and then carries on again. Occasionally there may be localised twitchings of the arm or leg. In temporal epilepsy, in which the condition arises in the lobe under the temples, there is no obvious interruption of consciousness, but the patient suddenly stops what he is doing and proceeds to do something else. For example, a man whilst at work may stop what he is doing and for no apparent reason at all proceed to go through his pocket-book, examining its contents with great care, and then puts it back in his pocket without afterwards knowing what he has done. Rarely, criminal acts may be carried out whilst the individual is in this state.

Epilepsy tends to run in families, and it varies greatly in severity from the case where an isolated fit occurs once in a lifetime to the case where fits are frequent and violent, and there may finally be some degree of mental deterioration. Some cases, although not many, pass into a state in which one fit succeeds another until death results. This is known as status epilepticus. Fits may have many causes: hypoglycæmia (*i.e.*, lack of sugar in the blood produced by an overdose of insulin), lack of oxygen, uræmia, injury to the brain from an accident, brain tumours, and meningitis. But true epilepsy shows no such antecedents—it just happens, and although it is apparently the result of something wrong with the chemistry of the brain, what this something is, is not known.

It is important not to jump to the conclusion that because someone has a fit they therefore have epilepsy, and all such cases should be carefully investigated. Children, in particular, may have convulsions during a fever when the temperature is high without necessarily having epilepsy. The treatment of idiopathic epilepsy, that is, the type due to no known primary cause, is to give sedatives which damp down the brain activity. In former

times bromides were used for this, and later phenobarbitone, which, indeed, is still used, but more recently the tendency has been to use such drugs as Epanutin with or without phenobarbitone, as this drug makes the patient less drowsy and is, in some cases, more effective.

Epileptics often find it difficult to get work because of the reluctance of employers to take on someone who may be more prone to accidents and whose fits may distress other workers. Obviously there are some jobs which epileptics should not do because of the danger involved, and they should not drive a car; a few cases are so severe that work is almost impossible. But employers have a duty, whenever possible, to employ these people, whose mental health may suffer greatly if they are made to feel outcasts and who ordinarily are as efficient, or even more so, as the next man. If some of the famous men who have suffered from this disease had had to rely on the charity of some employers today the world would have been much the poorer, although possibly we could have managed without the generals.

Chorea, or St. Vitus' Dance, is connected in some way with rheumatism, especially with rheumatic fever. It is much less common than formerly, and is also known as Sydenham's chorea, after the English physician who first described it and to distinguish it from Huntington's chorea, a serious hereditary and incurable degenerative disease which leads to progressive mental deterioration. Fortunately, Huntington's chorea is rather rare. The patient with Sydenham's chorea is a child, most often a girl, and one who has been rather delicate and nervous. She shows an inability to keep still and makes purposeless movements, such as writhing and twitching of the limbs and grimaces of the face. The speech may be affected, and the muscular inco-ordination may be so pronounced that dishes or other objects fall from the hands when lifted. The treatment for chorea is that for acute rheumatism with the addition of sedatives. The heart may be affected.

Pink Disease is a disease of young children between the ages of six months and three years. Why it should be included here is not certain; for its cause is unknown, and the theories to explain its origin range from the supposition that it is a vitamin-deficiency disorder, an infection, or the result of poisoning by mercury in teething powders, to the more probable theory that it is a vasomotor disorder like chilblains brought about by the nerves which control the diameter of the arteries. (Here it should be said that "teething powders," whether or not they play any part in causing this disease, should never be used, anyhow, since in the first place—doubtless to the great indignation of mothers who, of course, always know best—one must say that it is extremely uncertain whether the many disturbances allegedly due to teething have anything to do with teeth at all, and secondly, that whether or not teething causes anything, it is certain that the numerous powders available in the shops can do nothing about it.) Pink disease was first described in Australia in 1914, and the general picture is that of a child in acute misery with itching or burning of the hands and feet, which are swollen and pink in appearance. Sometimes the face, ears, and nose are affected, there is loss of appetite, sweating, insomnia, and thirst. The treatment of the condition, which may last many months but with an ultimately good outlook, is injection of the B vitamins, especially B12, rest, and sedatives.

Angio-neurotic œdema. Another mysterious disease, common to both children and adults, and mentioned here because it, too, seems to be caused by malfunctioning of the nerves controlling the blood-vessels, is angio-neurotic œdema in which attacks of œdema (swelling) occur in various parts of the body, but are most apparent in the face. Undoubtedly allergy to various foodstuffs can play some part, but emotional factors are at least equally important. Very frequently, without any warning at all—but often after an emotional outburst—the face within a short time swells so that the patient is almost literally unrecognisable. Sometimes the swelling is so severe that breathing is endangered by œdema of the glottis, the entry to the windpipe. An immediate injection of adrenalin usually starts to clear up the condition, and for later use the antihistamine drugs have proved helpful.

THE DEGENERATIVE DISEASES.

There are very many conditions coming into this category, and they are given different names according to the parts of the nervous system affected. However, they all have this in common, that they are the result of a degeneration of groups of nerve cells, usually for no known reason, and, since nerve cells once destroyed can never regenerate, the diseases are usually irreversible and progressive. In a few cases, however, they can be arrested.

It would be impossible to deal even briefly with all these diseases, so here only a few of the more common ones will be discussed. The ones we shall mention are: muscular atrophy, amyotrophic lateral sclerosis, disseminated sclerosis, syringomyelia, and subacute combined degeneration.

Muscular atrophy is, in fact, a whole group of diseases in which there is some damage to the lower parts of the nervous system, usually in the nerve cells at the point where they leave the spinal cord. The common type, *progressive muscular atrophy*, occurs in middle age or over, and the patient begins to note wasting of the muscles in first one hand and then the other. Ultimately, the hand becomes claw-shaped, and some wasting may spread up the forearm. It may finally spread up to the base of the brain, with fatal results. There is no known cure. In children a similar condition is *peroneal muscular atrophy*, in which degeneration of the nerve cells in the spinal cord leads to wasting both of the hands and legs. In this case, however, the disease may stop of itself after several years.

Amyotrophic lateral sclerosis affects both the lower and higher nerve cells. There is wasting of the hands and arms, with increasing weakness, and the legs show a spastic type of paralysis, *i.e.*, they do not waste, but the muscles are in varying degrees of spasm and the knee-jerk and other reflexes are increased. The disease has been treated with concentrated vitamin E, but the results are uncertain. It should be noted that to say that a disease is incurable is not at all the same thing as saying that the patient is going to die from it. Some of these diseases progress very slowly, or may stop of themselves, and any disease process tends to go slower as one gets older. For example, many old people with cancer die of old age long before they are in danger of dying from the disease.

Disseminated sclerosis—sclerosis means hardening of the affected parts of the nervous system—is a progressive condition which goes on with periodic intermissions of improvement. Often the first symptom is double vision or sudden weakness in a limb, but the later symptoms are largely those resulting from loss of muscular co-ordination; thus, when the patient is asked to shut the eyes, stretch out the arm at right-angles to the body and then touch the tip of his nose, he manages the first part of the movement fairly adequately, but as the finger nears the nose it starts to wobble and fails to reach its goal. There is thus some loss of sense of position and difficulty in carrying out such actions as drinking tea from a cup. Another typical symptom is nystagmus, in which, when he is asked to look to one side, the patient's eyes jerk back and forth (this condition is, of course, also a feature of so-called "miner's nystagmus," which appears to have a large psychological element and certainly has nothing to do with disseminated sclerosis). In later stages the spinal cord becomes affected and there are varying degrees of paralysis in the lower half of the body so that the legs are useless and there is loss of control of bladder and bowels. Thus, although disseminated sclerosis is not by itself a fatal disease, it does result in the long run in the patient becoming increasingly bed-ridden. Ex-

amination of the nervous system reveals that the covering of the nerve fibres—which have a sort of insulating layer much the same as in the case of electric wires—has been damaged and the underlying fibres have degenerated themselves. Where this damage occurs, and this appears to be completely fortuitous, determines the nature of the symptoms and where they occur. Many treatments have been tried, but their number only emphasises how little we know. The disease may be the result of inborn weakness in the fibres, of allergy, or of a virus infection with a so far undiscovered virus, but since it occurs in young adults in the prime of their life it is a particularly tragic disorder. Strangely enough, it is confined almost entirely to Europeans, and is rare elsewhere in the world.

Syringomyelia, another degenerative disease, is caused by the formation of small cavities in the upper parts of the spinal cord in the neck and chest regions. These cavities become surrounded with scar tissue, and hence interfere with nerve impulses passing down the areas where they occur. The patient may be any age between ten and thirty, and suffers from both sensory and motor symptoms. There is wasting of the muscles of the hand, and sometimes of the arm and shoulder, and specially typical is loss of the sense of pain with retention of the sense of touch. Because of this, the patient may burn or cut his fingers without noticing anything. The disease is slowly progressive over a long period of time, and there is no known effective treatment.

One of the few degenerative diseases which can be treated is *subacute combined degeneration*, which is invariably associated with pernicious anæmia. A middle-aged patient notices numbness, pins and needles, and so-called lightning pains in the fingers and toes and later in the limbs. The muscles are weak, and the tongue is smooth and glossy. On examination, the symptoms of pernicious anæmia are found. Treatment for the anæmia puts a stop to the disease, although damage already done may remain.

INFLAMMATORY DISEASES.

These are those, such as shingles or neuritis, which may be due, as is shingles, to virus infection, or to various causes, as is neuritis. The virus causing *shingles* is apparently the same as that causing chickenpox. Shingles, or to give it its proper title *herpes zoster* (it must not be confused with *herpes labialis* or cold sore of the lips, with which it has no connection whatever), shows itself in the form of a band of pain surrounding the upper abdomen or chest, which is then followed by an eruption with blisters in the affected area. There is no specific treatment; aspirin may be given for the pain and the eruption painted with collodion or " New Skin." Ordinarily the condition clears up fairly quickly, but the pain may persist for a long time. Injections of vitamin B12 are sometimes helpful.

The word " neuritis," meaning inflammation of a nerve, covers many different types of illness: polyneuritis, simple neuritis, neuralgia, sciatica, prolapsed vertebral disc, and other conditions. All they have in common is nerve pain; for, as in the case of " colds," one cannot assume that because a condition has one name it represents one disease or has even one cause.

Multiple, peripheral, or polyneuritis is, as the name indicates, a condition in which numerous of the peripheral nerves, mainly in the limbs, are affected. The symptoms will vary according to whether motor or sensory nerves are attacked. The causes are various: poisons, such as lead, arsenic, or alcohol; bacterial poisons, such as those of diphtheria, typhoid, or gonorrhœa; vitamin deficiencies, as in beri-beri; and, finally, diseases of metabolism, such as diabetes. Rarely, an infection known as acute infective polyneuritis causes the symptoms. The parts affected depend to some extent on the cause. Thus alcohol brings about, when taken in excess, pain in the calves and foot-drop (*i.e.*, the foot hangs down and cannot be raised to its normal position); neuritis due to diabetes and arsenic shows similar symptoms, whereas in lead poisoning not only the foot but also the wrist may be affected. Diphtheria tends to attack the palate and the eyes, causing difficulty in swallowing and in vision.

The ordinary type of neuritis, however, is localised—and here it should be said that many pains described as neuritic are nothing of the sort, being probably caused by fibrositis or muscle and joint disorders. Typical of localised neuritis is *Bell's palsy*, neuritis of the facial nerve, in which one side of the face is paralysed so that the eye on the affected side will not shut, and the mouth droops down. Asked to whistle or blow out his cheeks, the patient with facial paralysis is unable to do so. The usual cause of Bell's palsy is cold—for example, it is common to find that the patient has been driving with the car window open in cold weather. But facial paralysis may also be caused by infection in the middle ear. Most cases clear up in a fairly short time, but in a few instances the palsy is permanent. There is very little evidence that the treatments usually employed, such as electrical stimulation, have any effect, but injections of concentrated vitamins B may be useful.

Other familiar types of neuritis are *sciatica* and neuritis in the arm. They can be caused by fractures, or pressure from tumours, or the callus (excess bone) in badly healed fractures; cold, too, is said to be a factor, and then there is always " idiopathic neuritis "—which, in everyday language, means that one does not know the cause. Most cases, regrettably, are idiopathic. In sciatica, we have a condition which is not a disease but rather a symptom. The familiar pain down the back of the leg may be caused by alcohol, rheumatism, diabetes, tumour, fibrositis, " slipped disc," arthritis of the hip joint, infection from local areas in the body, such as tonsillitis, and so on. Treatment depends on the cause, which frequently is never found.

Prolapsed Intervertebral disc is a popular disease in these days. It causes a sciatica-like type of pain, and is brought about by the bulging of an intervertebral disc (the shock-absorbers, which lie between the vertebræ of the spinal column) into the area where it can press upon the nerve root. Treatment is first by rest and pain-relieving drugs; if this is not enough laminectomy is performed and the protruding part of the disc removed.

Paralysis agitans or Parkinson's disease may result in young adults following an attack of encephalitis, or in older people, in whom the part of the brain concerned simply deteriorates. The face becomes expressionless, the movements stiff and slow, the gait shows a shuffling tendency, in which the patient bends forward and seems to be running to catch up with himself. There is tremor of the fingers and the so-called " pill-rolling " movements, in which the thumb and fingers are constantly moving against each other. Treatment is by drugs, such as hyoscine or more modern proprietary ones; in some cases surgical operation has been used with varying degrees of success. The disease is also known as " shaking palsy."

MENTAL DISEASES.

Psychosis.

Mental diseases are divided into psychoses (*i.e.*, insanity) and neuroses (*i.e.*, what is ordinarily known as " nerves "). Psychoses, in their turn, are divided into organic and functional—those due to physical disease and those in which no physical cause has been discovered. In point of fact, the distinction into organic and functional is rather meaningless; for if we accept the modern view of psychosomatic medicine which regards the body

and mind as a single unit it is clear that organic disease brings out psychological defects which were already there and that functional disease must, in the final analysis, be the result of physico-chemical causes, even if this is brought about by mental stress.

Organic disease results from poisoning of the nervous system by such poisons as alcohol, carbon monoxide, or lead; vitamin deficiencies, as in pellagra; infections such as syphilis; and degeneration of the brain, either primary or as a result of poor blood supply. In all cases its main symptoms are confusion, signs of other disease, and loss of memory. Alcohol leads to various conditions: in *delirium tremens* heavy bouts of drinking end in delirium ("D.T.s"), confusion, hallucinations—although not necessarily of pink elephants or rats. It is a serious disease, but the outlook is much improved since it was discovered that injections of concentrated vitamins B and C in the form of "Parentrovite" can help. In more chronic cases *Korsakov's syndrome* manifests itself in the form of mental deterioration and memory defects. There can be little doubt that previously existing mental instability is a predisposing factor in these conditions. The same may be said of *general paralysis of the insane* or G.P.I., and in this case the immediate cause is syphilitic infection of the nervous system. Nevertheless, of all the patients with chronic syphilis, only a small number get syphilis of the nervous system. G.P.I. is typically associated with the usual symptoms of organic disease and delusions of grandeur; for example, a man with this disease may go out and buy several expensive cars in one day. However, it is not uncommon to find G.P.I. associated with severe depression—again the picture depends on the previous personality. At one time G.P.I. was considered hopeless, but treatment by malaria (that is, deliberate injection of malarial germs) was found to be helpful. Today, although in some places the treatment is still used, penicillin is found to be adequate. The association of the above symptoms with a positive Wasserman test—which proves the presence of the spirochæte in the blood—indicates neurosyphilis. When the lower centres of the nervous system are affected the disease is known as *tabes dorsalis*, in which there is difficulty in passing urine, limb pains, inability to stand when the eyes are closed, and finally difficulty in walking. The patient becomes paralysed and ultimately bedridden. Treatment is with penicillin.

People age at varying rates, so that some are hale and hearty at eighty or ninety whereas others are old at sixty or seventy. They present the typical picture of old age: "second childishness and mere oblivion, sans eyes, sans teeth, sans everything." When this condition, which is caused by degenerative changes in the brain or by defective blood-supply resulting from arteriosclerosis, is pronounced we speak of *senile psychosis*. There is mental confusion, forgetfulness, and delusions, in which the previous personality defects which we all have are accentuated. Such patients may have to be put under special care, but the process is largely irreversible.

The functional psychoses are two in number: schizophrenia and manic-depressive insanity. In *schizophrenia*, which, when it occurs in early adult life, is known (or used to be known) as *dementia præcox*, the symptoms are bizarre. There are delusions and hallucinations, so that the patient often believes himself to be persecuted and hears voices which say objectionable things to him. Sometimes the schizophrenic is wildly excited, and in other cases he goes into a state of stupor which is described as a catatonic state. Although the disease is described as functional, recent discoveries seem to suggest that there is some derangement of the blood chemistry. Treatment by insulin and the new tranquillising drugs has revolutionised the outlook in this admittedly serious disease. Indeed, some cases of psychosis are more easily treated than neurotic patients, since the former respond to physical methods, whereas the latter may require fairly prolonged psychotherapy (psychological treatment).

In cases which do not respond to other methods, the brain operation known as *leucotomy* may be performed. Leucotomy is also performed to alleviate intractable pain, as in incurable cancer, but some of the ataraxic drugs (tranquillisers) are probably equally useful for this purpose. Leucotomy involves the severing of the connecting nerve fibres between certain areas of the brain, and the results are most favourable, but in fact the operation should be performed only in cases where the outlook is otherwise very poor; chronic severe neuroses, frequent attacks of manic depressive psychosis, severe chronic depression, and schizophrenia which has not responded to other forms of treatment. The operation reduces anxiety, fear, aggressiveness, and agitation, but may result in the less-desirable symptoms of apathy, impaired judgment, lack of self-control, and loss of initiative.

Schizophrenia developing in later life is likely to be less dramatic in origin, and the delusions tend to be more systematised—that is, they take a persistent form, which does not change from day to day. This type of the disease is known as *paraphrenia*. In those beyond middle age the rare but dangerous condition described as *paranoia* may develop in which there are no hallucinations and the only symptom is a completely systematised collection of persecutory delusions, which on recital may sound entirely convincing even to the ordinary doctor. Such people are dangerous precisely because they are so plausible, and they fill the ranks of the litigious, the trouble-makers, and the political and religious eccentrics. One such patient known to the writer spent his life in a mental hospital from which he had parole, which he used to form a society propagating highly eccentric sexual and political beliefs. It says little for the intelligence of the general population that his meetings were invariably crowded out (although, of course, when one reads of the people who apparently believe that the various fictitious families on radio or television—the Groves, the Archers, and the like—really exist, one need not be surprised at such examples of communal dottiness, even if one may despair of democracy).

Manic-depressive insanity is characterised by mood swings in which the emotions alternate between wild elation without obvious cause and equally causeless depression. However, the picture is not quite as simple as this; for phases of mania or excitement may occur without depression obviously following, or there may be a single attack of depression with no manic phases. The disease may be absolutely incapacitating, or there may be periods of relative normality; typically, then, manic-depressive insanity is a disease of alternating moods. The depression responds to electroconvulsive therapy or E.C.T., but mania is less responsive to treatment. However, it ordinarily remits of itself. Sometimes in middle age *involutional depression* occurs, and this in the vast majority of cases is cured by E.C.T.

Neurosis.

The main neuroses are anxiety neurosis, hysteria, and obsessional neurosis. *Anxiety neurosis* is an illness in which the main symptom (as the name implies) is anxiety. There is fear which rationally the patient knows to be groundless; there may be anxiety attacks, in which the heart pounds, the patient feels he is going mad, is unable to sleep, and worries "for no reason at all." In hysteria, anxiety is largely absent, but there may be apparently physical symptoms ranging from paralysis of the limbs to blindness, deafness, inability to write, and lapses of memory (the so-called hysterical fugues or loss of memory). Typical of *hysteria* is the fact that the patient is less worried by his symptoms than would be expected from their apparent seriousness; this is what the early psychiatrists described as "la belle indifference." The reason for the indifference is simple—it is that the paralysed individual *wants* to be paralysed, the blind *want*

to be blind, the deaf to be deaf (there are none so blind—or deaf—as those who don't want to see, or hear), and the person who doesn't want to write conveniently finds that he cannot.

Generally speaking, neurotic people are suffering from a failure to face up to reality. They are not physically ill and are largely the end result of a faulty upbringing. It is wrong to suppose that the only bad families are those in which the children are ill-treated; much the worst ones are those in which children are spoilt, the parents possessive, and the wrong kind of love is dispensed. Neuroses are the result of a conflict between primitive desires and what the individual has been brought up to believe he should be. For example, before an examination a student may develop a nervous breakdown because he fears failure when he has been brought up to expect success. The excuse, of course, is "overwork"—an entirely non-existent condition. With his breakdown he solves his problem, he avoids the fear of failing and preserves his self-respect: he has been ill. Similarly, the soldier with "shell shock" (another non-existent condition) has a conflict between his sense of duty and his fear of death, which again is solved by becoming ill. Or, to take a final example, a woman feels the duty to look after her ageing mother. But she also wants to get married. So she unconsciously develops a neurosis which says, in effect, "I should like to do my duty in looking after my mother, but unfortunately I am unable to." There is an unconscious rebellion on the part of the mind.

Neurosis, in effect, is not a disease—it is a self-inflicted injury, a form of maladaptation to life. The neurotic, no matter how much he suffers, does not want to get well; he has found some way of getting along, even if a foolish way, and he intends to keep it. Often his symptoms are the sort of excuse that say: "If only I wasn't ill what wouldn't I be able to do!" The neurotic is a person who is different and is afraid to be himself; his problem is a conflict between being "ordinary," "like other people," and being what he was supposed to be. You will find some other suggestions about neurosis in the section dealing with Family Affairs.

Obsessional Neurosis is a more severe type of neurotic illness; for although in anxiety neurosis we find such symptoms as phobias—irrational fears of open spaces, closed spaces, animals, and so on, obsessional states are characterised by compulsive feelings that certain acts must be performed or certain thoughts thought. In a mild form we all have obsessions: we feel that we must walk on the spaces between paving-stones, that we must touch lamp-posts, and so on. But when this type of compulsion gets to the stage when we must go back several times to make sure the lights have been put out, when we feel the need to wash our hands every few minutes, become obsessed with numbers on cars or dates on coins, then it becomes a nuisance and requires treatment. Usually the treatment is psychotherapy—whether psychoanalysis according to the method of Freud or shorter methods—and, in serious cases, physical methods such as L.S.D. (lysergic acid) or leucotomy. The obsessional neurotic is a person who feels that life must be controlled; he is "a creature who moves in predestinate grooves—he's not even a bus but a tram." His symptoms are an attempt to devise self-imposed rules which will control the unconscious desires of which he is so afraid.

Neurasthenia is an entirely imaginary condition allegedly due to exhaustion of the nervous system. Since no such condition exists, we need not bother with it. Neuroses cannot be treated by feeding the nerves (which are perfectly normal). They can be helped by such things as sedatives, but not cured. *Neurosis has nothing at all to do with disease of the physical nerves, so nerve tonics do not exist, and anyone who asserts that they do is a humbug.* Glycerophosphates and the usual contents of tonics are excreted almost as soon as they are taken in, and tonic wines are one of the best ways of becoming an alcoholic. The one reason for not taking alcohol is when one craves it, and many a "respectable" old lady has required several dust-carts to carry away the store of empty bottles left behind when she died.

Psychopathic Personality is the term given to anyone who has different standards of behaviour from those generally accepted by society. Some of these unfortunates may be *inadequate*, that is to say, although perfectly intelligent, unable to earn their own living. Others are the *creative* people, who, as in the case of Van Gogh, did many eccentric things but also many productive things—Van Gogh was gifted, or cursed, with an intense sensitivity. Lastly, there are those who have what others regard as peculiar sexual habits. Of the first two classes nothing more need be said, and all that is necessary is to mention certain of the so-called sexual perversions. (When we say so called the implication is not that none of these forms of behaviour is perverse but that some of them are carried out by otherwise quite ordinary people.) *Sadism* and *Masochism* refer to, in the first place, pleasure in inflicting pain and, in the second, to receiving pain. The pleasure is sexual, and it is incorrect to talk of cruelty in itself as sadism. Sadism is named after the Marquis de Sade, who suffered from this perversion, although he certainly did much less harm in his small way than numerous politicians or generals of our time, and masochism is named after the Austrian novelist Sacher-Masoch, who wrote books which, although unpleasant, were not notably more so than certain Sunday newspapers of today.

Masturbation, which used to be known as "self-abuse" and, even more incomprehensibly, as Onanism (after a story in the Bible which has no relationship to the problem at all) is sexual self-stimulation. Needless to say, it produces no more *physical* harm than ordinary sexual intercourse—that is to say, none at all, although some people have the strange belief that every act of intercourse weakens the body and it has even been believed that each act shortens life by a specific length of time. This is rather illogical in view of the fact that most of the famous rakes have been noted for their longevity! Masturbation is almost universal in infancy, adolescence, or even in later life when other outlets are not available. It need only be a matter of concern: (*a*) when it is chosen in preference to normal sexual activity, or (*b*) when it is compulsive and excessive, since then it is a sign, not of sexual desire, but of severe underlying anxiety.

Homosexuality is, as presumably most people now know, an attraction between individuals of the same sex. Feminine homosexuality is not illegal in Britain, but male homosexuality is. The Wolfenden Report of 1957 takes a much more tolerant view of the problem than has been hitherto current, recommending, in effect, that homosexual acts between consenting adults should be legalised. Homosexuality is, so far as is known, not inherited, and is the result of psychological difficulties in early development; occasionally it can be treated by psychotherapy, but it is doubtful whether those "cured" in this way were ever genuine homosexuals. To any humane person it must seem that the Wolfenden Report gives a sensible solution to the problem; for it is difficult to see why the homosexual should be treated differently from the heterosexual offender. That is to say, what adults do (with consent) together is their own business, but the male homosexual who seduces a boy under age should be treated in no way differently from the man who seduces an under-age girl.

All that remains to be said is that many of these conditions are treatable or, if not treatable so far as cure is concerned, they can at least be relieved. The world is full of people who are "different"; there are those who are different in the right way, who should take satisfaction from their achievements, and those who are different in the wrong way, who should seek expert advice. Since psychological treatment is time-consuming, it is not very easy to obtain it within the National

Health Service, although group treatment has simplified the problem. However, any person with such difficulties would probably benefit from a discussion with his family doctor.

DISEASES OF THE SKIN.

The skin in the course of development before birth is particularly closely associated with the nervous system. It is therefore not surprising that so many skin diseases are influenced by emotional states. Other causes of skin disease are infections, glandular disorders, vitamin deficiencies, and the numerous conditions for which no cause has been discovered, but which presumably are due to metabolic disorders.

One of the commonest of skin symptoms is *itching or pruritis*, as it is more properly described. This may be caused by parasites, such as the *scabies* mite or *lice*. The scabies mite is very small, and since it burrows under the skin surface, is even less likely to be seen; it is the cause of itching most commonly between the fingers and on the front of the wrists. The itching is worse when the body becomes heated, as when one goes to bed. Treatment is hot bathing, followed by inunction with sulphur ointment, although there are now more pleasant preparations available. Scabies, of course, is contracted through close personal contact with an infested person. Lice are specialists, one type of which affects the scalp, another the body, and a third the genital area. There are various preparations which can destroy head lice, from lethane, a relatively pleasant treatment, to the traditional mixture of equal parts of olive oil and paraffin, which, needless to say, is as unpleasant as it sounds. The head must be covered with this mixture for about two hours and then washed. Body lice are best dealt with by D.D.T. powder, and genital lice by shaving off hair and washing. Obviously, the clothes, especially in the case of body lice, should be disinfested, either by the use of D.D.T. or, if this is not available, by using a hot iron over the seams, which lice (for some inexplicable reason) seem to favour. Apart from the discomfort they cause, lice are dangerous as potential carriers of typhus fever.

Itching may also result from other causes, and is especially common around the anus and genital organs. In these areas it may be caused by worms, by irritating vaginal discharge, by acid urine or —as in diabetes—by sugar in the urine. General diseases in which itching may occur are diabetes, jaundice, gout, and leukæmia. Lastly, and perhaps most commonly, pruritis may occur during the change of life in women, in old age, or in nervous conditions. Itching during the menopause is sometimes helped by sedatives and sex hormones, and there are ointments which may help; in very severe cases X-ray treatment may be necessary.

Baldness, or Alopecia, is a very common condition, as is manifested by the extraordinary number of preparations advertised as curing it. When many preparations are offered for the treatment of one condition it is a fair judgment to assume that none of them is likely to be effective. There are, in fact, two types of baldness; one, which is much the commoner, is hereditary, and cannot be influenced in the slightest by any treatment, the other, *alopecia areata*, is caused by nervous stress, and would recover in most cases by itself, whether one used a solution of soot and water or the most expensive "hair food." There is no such thing as a hair food, any more than there is such a thing as a nerve food, and although it is probable that hair hygiene may delay baldness, it certainly cannot prevent it. All hair tonics and "foods" are useless, and their uselessness is only equalled by their costliness. Those who have lost their hair and find it growing again after using some alleged tonic are people who have had *alopecia areata* and whose hair would have grown back anyhow.

Seborrhœa is a condition in which there is over-activity of the sebaceous glands, with subsequent infection. The most usual form it takes is *dandruff*. However, it takes other forms, and those who have dandruff may also have rashes on the face, shoulders, and chest. In these areas there is a patchy, greasy, and often itchy, rash which does not clear up until the primary condition in the scalp is dealt with. The scalp should be washed with one of the modern sulphur-containing shampoos at least twice a week, and the affected parts on the face and chest should be dealt with by the use of sulphocalamine lotion (*not* on any account by greasy ointments). Seborrhœa is not in itself difficult to treat, but, since the condition depends on over-secretion of sebum, the skin lubricant, treatment may have to be persisted in during the years of early adulthood, when it is most active.

Erythema Intertrigo is, quite simply, the sort of irritation which occurs usually from excessive sweating under the armpits, between the legs, and under the breasts in women. All that need be done is to wash frequently and to dust the affected areas after washing with powder. This is the condition which, in the tropics, is known as "prickly heat" and elsewhere as a "sweat rash." In some people *hyperidrosis* or *excessive sweating* is a problem, especially when the sweating is accompanied with body odour—the sort of thing that, according to the advertisements, "even your best friends won't tell you." There is little need for anyone in these days to suffer in this way: for the cosmetic firms have produced many highly efficient deodorants which not only control odour but also control the amount of sweating. Chlorophyll, which has been much advertised as removing odours, is, there can be little doubt, effective when applied directly to surfaces which give off an unpleasant smell. It is effective, for example, in septic wounds, and probably in the mouth. What is much more doubtful is whether, when taken by mouth, it prevents body odours. One is reminded of the fact that goats are: (*a*) noted for their strong odour, and (*b*) live on chlorophyll in the vegetation which they ordinarily eat:

> "The goat that reeks on yonder hill,
> Has fed all day on chlorophyll."

But, say the manufacturers, the chlorophyll we prepare is different; it is not sufficient simply to take chlorophyll as it comes from grass or any other type of green vegetation. And they may be right—who knows? In any case, one way or another, there is no reason why, in these days, one's best friend should have anything to tell at all.

A symptom which is only important because some people regard it as a sign of saintliness is *chromidrosis* or *hœmatidrosis*—the sweating of coloured perspiration, or what sometimes appears to be blood. Alas! the red coloration (as in the case of a certain "miracle" which occurs yearly in a church, which—to avoid offending religious susceptibilities—shall be nameless) is caused by bacteria. Blood is not sweated by anyone; not even by saints.

Chilblains are extremely common in cold weather, especially in those with poor circulation. Ordinarily they occur in the toes and fingers, but may appear on the nose and ears. The part affected becomes swollen, dusky, and there is pain and itching, sometimes leading to ulceration. Treatment is to give plenty of nourishing food and to stimulate the circulation. Vitamins A and D are useful, in the form of Adexolin or capsules of halibut-liver oil, and either nicotinic acid or "Pernivite" may be used. It is best to wear woollen socks and gloves during the cold weather. A skin affection caused by heat is rather grandiosely described as *erythema ab igne*, and is frequently seen on the legs of ladies addicted to roasting their legs before the fire. It takes the form of red patches on the front of the legs, and can be removed only by avoiding the cause.

Dermatitis means "inflammation of the skin," and therefore the word could be, strictly speaking, applied to any skin disease. It certainly does not

warrant the terror it usually seems to inspire when, as is often the case in industry, the worker, on being given the diagnosis, says: "You don't mean *dermatitis*, do you?" For some reason or other, the word is now ordinarily used to describe skin diseases caused by substances which harm the skin either because the individual is sensitised to them or because they are in themselves dangerous. When the injury is the result of a substance such as strong acids or alkalis which would be harmful to anyone, the condition is known as "primary dermatitis," and it is typical of such injuries that when the harmful material is removed the dermatitis goes. When, on the other hand, the disease is caused by allergy to an otherwise harmless substance—vegetables, detergents, soap, fruit, and even cosmetics—it may persist for a long time, even after the patient is no longer in contact with the material. At least 95 per cent. of cases come into this category, which has been described by an eminent skin specialist as "a disease of the personality," and only the remaining 5 per cent. are dermatitis caused by genuine irritants. As regards these cases, no problem exists; they clear up rapidly with conventional treatment. But the other 95 per cent. are a serious problem; such cases may respond to the antihistamine drugs, sedatives, and psychological treatment. In the most real sense they are suffering from a self-inflicted injury due to their problems, their resentment, or anxiety, and it is noteworthy that most cases of this type of dermatitis occur in departments where morale is low.

Impetigo is an infectious skin disease caused primarily by the streptococcus, but later often infected with staphylococci. It usually occurs on the face, and takes the form of blisters filled with pus on a red base; when the blisters burst their place is taken by yellow crusts. Impetigo is very infectious and easily spread by the fingers, dirty towels, or cloths; therefore, one of the first necessities is to prevent infection of others or reinfection of oneself by avoiding scratching and using a different towel each day, which must on no account be used by anyone else. Treatment is simple, with sulphonamide powder or penicillin, so the main issue is prevention of contamination. If care is not taken on this point, no treatment is of the slightest use.

Sycosis or "Barber's Rash" occurs in men, and is similarly treated.

Urticaria, or Nettlerash, is a familiar skin disease in which blisters appear on the skin for no obvious reason. It is not infectious, and is caused by allergy to some foodstuff (such as shellfish, mushrooms, or fish of any type which is "a bit off"), certain drugs, and nervous stress. The blisters are itchy, and in those who are specially susceptible it may even be possible to write on the skin with the finger-nail: the "writing" appearing in the form of weals. This is known as "dermographia." The immediate treatment is an injection of adrenalin; afterwards the antihistamine drugs may prove useful.

Acne, or "Blackheads," is a condition found on the face and shoulders; its appearance is so familiar that no description is necessary. Acne is one of those conditions which is the end result of many factors. There is, first, a greasy skin, the result of glandular upset (which is why the disease usually occurs in adolescence); secondly, there is infection of the skin; and thirdly, there is blockage of the sebaceous ducts, which ordinarily allow the grease from the skin to pass out on to the surface. Since the condition starts with excess secretion of grease, ointments should never be used, and probably the best application is sulphocalamine lotion. The face should be frequently washed, and it is possible now to obtain detergent solutions which are both antiseptic and prevent grease formation. In severe cases X-ray treatment may be necessary.

Rosacea. As has already been implied elsewhere, although the wages of sin may be extremely unpleasant, the wages of extreme virtue may be no less troublesome. Thus *rosacea*, in which the nose and cheeks become red and greasy and the skin coarsened, occurs alike in chronic alcoholics and elderly ladies with no vices other than a preference for strong tea. Both cases are associated with indigestion, since, regrettable as it may seem, strong tea and alcohol are about equally liable to cause the gastritis which is invariably at the root of this complaint. Treatment consists in the careful attention to diet and temperance in all things—especially tea.

Lichen Planus is one of the numerous skin diseases which seem to be due to nervous states of tension. It may occur on any part of the body, but is most common on the front of the forearms and legs. The rash takes the form of blisters which are lilac in colour and have a dent on the top; when these disappear a stain is left behind. There is severe itching. Treatment is a matter for a specialist, as it also is in the case of *psoriasis*, a very common disease of largely unknown origin, which is extremely resistant to treatment. It takes the form of slightly raised papules, usually on the elbows and knees; typically the papules are covered with dry, silvery-looking scales. Apart from the rash, the patient is usually in perfectly good health and there is no itching. Many drugs have been used in psoriasis, notably chrysarobin, and while it is not difficult to cause the rash (which may occur anywhere on the body) to disappear in one area or even in all areas for a time it has a strong tendency to return.

Warts, or Verrucae, are familiar enough. They are caused by a virus, and are, theoretically at least, contagious (although having removed many warts, the writer has never found them contagious). Most frequently they are found on the hands, but may occur elsewhere. Treatment is best carried out by a doctor, who will use a cautery, a caustic stick, or in severe cases X-rays. A curious feature of the common wart is that it can sometimes be caused to disappear by suggestion, which is presumably why so many old wives charms are not necessarily without effect. Different altogether from the common wart is the *plantar wart*, which occurs on the soles of the feet and often causes a good deal of discomfort. It is best dealt with by a chiropodist or in bad cases by a skin specialist.

Icthyosis. A condition with which some unfortunate people are sometimes born is *icthyosis*, in which there is absence of secretion from the oil and sweat-producing glands, rendering the skin dry and scaly like the skin of a fish. It is, however, possible to help the condition, which does not affect the general health, by frequent alkaline baths to wash off the scales, and the subsequent use of lanolin to replace the lacking oil. Large doses of vitamin A seem to help in some cases, and there have been reports in the medical Press of cases being helped by hypnosis; this, however, is very much a matter of opinion.

Cancer, Rodent Ulcer, and Cysts. Cancer of the skin occurs mostly in old people, and takes the form of what is described as an *epithelioma*. It is most common on the face or hands, and usually appears as a nodule which breaks down and produces an ulcer. The glands may later be affected, but such cancers can almost invariably be cured unless a considerable time has elapsed during which they have been neglected. *Rodent ulcer* is a form of ulcer which appears on the inner corner of the eye or the side of the nose in old people. It does not spread over the body, but acts by eating into the tissues in the area where it has started. X-ray or operation is necessary, but the outlook is good. *Cysts* on the skin are due to blockage of the sebaceous glands. They may become very large, and should always be removed, as they may become infected. They do not turn into cancer, and there is no such thing as "male" and "female" cysts. It does sometimes happen that *moles*, especially of the bluish-black type, may become malignant, so it is perhaps best to have them removed surgically

when they exist. *All moles which change in appearance or size should be at once referred to a doctor.*

Skin Grafts.

These are a very complex subject which can be only briefly discussed here. They are used basically for a number of conditions in which large areas of skin have been removed from the body, as in burns or serious accidents. In other cases, as in plastic surgery, grafts may be used to make a new nose, eyelids, and so on. The following are the main types:

Pinch Grafts are small, circular pices of skin cut from some other part of the body. (The former method of using grafts from another person has been given up almost completely, since such grafts—except in the case of identical twins—never "take.") The small pieces are laid on the area without skin and gradually grow together. *Split-thickness grafts* are grafts removed from another part of the body by an instrument known as a dermatome, which cuts sections about 4 in. by 8 in. containing part of the deep layers of the skin.

In *Full-thickness Grafts*, on the other hand, the whole thickness of the skin is removed from elsewhere and applied to an area which has to bear friction or heavy weights, such as the hand or the foot. Lastly, and this is largely used in plastic surgery, there is the *Pedicle graft*, which, unfortunately, although it is certainly the most exciting type, is rather difficult to describe. Briefly, if one, for example, wants to make a new nose, one cuts an area of skin and underlying fat about 2 in. wide and 5 or 6 in. long in the abdomen. One end, however, remains attached so that it gets adequate blood-supply. The problem is how to get this tissue to the nose, and this is done by a complicated process of leap-frog. First, the free end of the graft is attached to the forearm, whilst its "root" remains in the original site, and when it begins to grow and get its blood-supply from the arm, the original "root" is cut. So we now have a "sausage" of tissue attached to the arm. The arm is then lifted to the face and kept firmly in position there until the new free part becomes attached. It is then detached from the arm, modelled to the correct shape, and grows where the nose used to be!

THE RHEUMATIC DISEASES.

The main rheumatic diseases (or so they are described, although they seem to have little relationship one with the other), are *rheumatic fever*, the acute form, which has already been dealt with; *chorea*, or rheumatism of the nervous system, also mentioned; *rheumatoid arthritis*; *osteoarthritis*; *gout*; and *fibrositis*. The only thing these diseases seem to have in common is that most seem to be associated with the muscles or joints—this, of course, with the single exception of chorea. Apart from this, there is very little similarity.

Rheumatoid arthritis often starts without evident cause in early adult life, and affects the small joints of the fingers and toes, causing swelling and pain. No infective process has been discovered, yet the disease goes on and on, sometimes better, sometimes worse. It is (and this is all one can say) a disease commoner in women, commoner in temperate climates, commoner following emotional stress. Although, as we have seen, rheumatoid arthritis is a disease characterised by frequent remissions, it takes a considerable time to burn itself out. The most likely explanation for its occurrence is that stress reactions act on the suprarenal glands and the secretion of cortisone is inadequate to play its usual part in preventing the body from responding too severely to injury. However, the injection of cortisone has proved, on the whole, less useful than might have been expected, and there is little reason to suppose that in most cases it is any better than aspirin.

Osteoarthritis is essentially a degenerative disease of old people. The bones affected are ordinarily the larger joints: the shoulders, the hips, or the spine. There is no disease in the ordinary sense, and essentially what has happened is that these joints have got "old" and the bone has overgrown so that movement is less simple than it once was. Osteoarthritis is not curable, but can be relieved by drugs and physiotherapy.

Gout, so far as one knows, has nothing at all to do with rheumatism. It is a metabolic disease caused by the inability of the body to deal with certain protein breakdown substances, such as uric acid. Typically, the pain develops in the big toe, and the foods concerned are such luscious products as wines, spirits, liver, sweetbreads. Although drugs such as cinchophen can help, the plain fact is that those liable to gout can either have sweetbreads and wine, liver and spirits, or gout! Most people, perhaps, would prefer the food and wine, but those who dislike gout must abstain.

Fibrositis. All diseases are annoying to the patient, but fibrositis is just about equally annoying to the doctor. Fibrositis, in fact, is a condition in which people come along (and how often they do so!) with muscular pain which may be caused by anything from falling down the stairs to quarrelling with their mother-in-law. Although at one time, and perhaps even now, it used to be said that those with fibrositis could be diagnosed by the presence of "nodules" in their muscles, it is almost certain: (*a*) that there are no such nodules, and (*b*) that muscular pain may be due to many causes and very largely to psychological ones.

DISEASES OF THE EYE AND EAR.

The Eye.

The eye is frequently compared to a camera, and in a general sort of way there is some resemblance. First, there is the very thin protective conjunctiva, the part which gets inflamed and irritable when you get germs or dust on the surface of the eye, and beneath this there lies the similarly transparent cornea. Light entering the eye passes through these two layers and then through the iris, which corresponds to the aperture or diaphragm of a camera; as in a camera, the amount of light passing to the back of the eye is regulated by the size of the aperture. When light is very strong, the aperture of the iris contracts to cut the light down; when it is dark it dilates to allow the maximum amount to enter. Behind the iris is the lens, which is controlled by a series of muscles which increase or diminish its curvature, and thus produce, according to the nearness or distance of the object, a clear picture on the retina, the screen at the back of the eye. (It is the lens which has developed an inability to focus properly which is the cause of short and long-sightedness, and the defect of the lens has then to be compensated for by glasses—that is, external lenses.) All these parts of the eye may, of course, be affected by disease. But here we shall deal only with a few of the more common ones.

Blepharitis is an infection of the eyelids which is easily recognisable from the red, sore appearance at the margins, the formation of crusts, and the falling-out of the eyelashes. If it has just developed, an attempt may be made to treat it at home with hot bathing and the so-called Golden Eye Ointment, but *blepharitis* is liable to become a chronic disease, and it is wiser to see a doctor. Penicillin cream or ointment can cure the disease, but must *never* be used save under medical advice; allergy to penicillin is commoner in the eyes than anywhere else, and in some cases patients have lost their sight through its use in this way.

Conjunctivitis is the result of infection of the conjunctiva, and the symptoms are the familiar

ones of a feeling as if some grit had got into the eye, running from the eye, and frequently gummed-together eyelids in the morning. In some cases it can be treated by hot bathing and eye-baths with one of the proprietary lotions on the market, but it is much wiser to see your doctor, who can supply much more effective remedies and may save you a lot of unnecessary discomfort.

Other Eye Diseases. We can only mention briefly *keratitis*, inflammation of the cornea; *iritis*, inflammation of the iris; and *glaucoma*. These are all potentially serious diseases, and should not be diagnosed or treated by the layman. Glaucoma, in particular, may lead to blindness if help is not sought in time. If there is redness and congestion over the eye, dimness of vision, *severe* pain (as contrasted with the irritation caused by conjunctivitis), and perhaps even vomiting, the doctor must be called immediately.

The main disease of the lens is *cataract*, in which the lens becomes opaque and varying degrees of blindness result. Ordinarily, cataract is a condition found in people after middle age, but sometimes it is found in children at birth. The treatment is by operation—one which has been carried out for centuries—in which the opaque lens is removed. The patient thereafter has to wear glasses, but the vast majority of patients obtain good vision.

In *retinitis*, however, where the "screen" at the back of the eye is affected, the general outlook is more serious. This is because, whereas cataract is a localised disease, retinitis often signifies some bodily illness: infection, hardening of the arteries leading to hæmorrhage, diabetes, or kidney disorders. Sometimes the retina becomes detached, leading to blindness. As has been suggested above, except in very minor conditions, such as styes (a localised infection treated in the same way as blepharitis), or conjunctivitis, the doctor should always be consulted. He should be consulted, too, when a foreign body gets into the eye unless it can be removed by very gentle manipulation with a handkerchief, for it must be remembered that such "poking about" on the surface of the eye may do much more harm than the original condition. So, if a couple of minutes fail to remove the grit, give up, and go to the surgery.

The Ear.

This is not merely the outer portion which is visible to all of us—this part of the ear performs the sole function of collecting the sounds and leading them into a tube which consists of three parts: the outer part (which is the part in which the main troubles are collections of wax, small boils, and sometimes skin irritation); the middle ear, which is separated from the outer ear by a membrane, the ear-drum, and the main disorder of which is otitis media, due to infection; lastly, the inner ear, where the sound impulses, transmitted by a chain of tiny bones through the middle ear, reach the nerve which passes them to the brain.

Wax, or Cerumen, is naturally secreted in the ear, but in most cases will dry up and fall out. Some unfortunate people, however, tend to accumulate it, so that after varying periods of time the ear is completely blocked and deafness occurs. Then they have to go to the doctor to have it syringed. There is no cure for this tendency except periodic syringing, although there is an oil on the market which allegedly softens the wax and makes it come away of itself. *Boils* in this part of the ear are small but rather painful; they should be entrusted to the doctor, who will give something to relieve the pain. However, once the boil has started, it is unlikely to regress, and will probably come to a head and burst, with consequent relief to the patient. Whilst we are dealing with the outer ear it should be said that, like the eyes, it should not be interfered with except by someone who knows something about it. Mothers should not poke the corners of towels into the ear in an attempt to clean it, nor if, as frequently happens, a child puts a bead or a pea into the ear should they try to dig it out. This should be left to the doctor.

Otitis Media, or infection of the middle ear, is another cause of earache, and, since the middle ear is shut off by the ear-drum from contact with the outside world, the ordinary source of infection is from the throat by way of the Eustachian tube, a narrow tube which passes between the back of the throat and the middle ear. Its normal function is to equalise pressure between the middle ear and the atmosphere—that is why, for example, when a large gun is being fired, soldiers are told to keep their mouths open, otherwise their ear-drums might be burst. But not only air but germs can pass up the tube, and when infection exists in the throat (such as adenoids or tonsillitis) it may move up to the middle ear and start disease. When this happens, pus begins to form and accumulates until it presses against the ear-drum, which causes severe pain. Without treatment one of two things may then happen; either the ear-drum bursts or the infection may spread backwards into the mastoid area—an area of spongy bone immediately behind the ear. This is known as *mastoiditis*, and together with otitis media, can be dealt with only by a skilled doctor. Sometimes antibiotics are adequate, but in other cases operation is necessary.

Tinnitus is the medical term for noises in the ears, which is one of the commonest conditions met with in the doctor's surgery. There are numerous physical causes, but there can be little doubt that very many of the cases seen are neurotic and show no physical disorder at all. Some of these unfortunate people, who undoubtedly suffer a great deal, go around from one doctor to another seeking relief and failing to find it, because the trouble is so often in their minds rather than their ears. One of the physical causes of tinnitus is *otosclerosis*, a disease of the inner ear in which the tissues become hardened and increasing deafness results. The treatment has not been, on the whole, very successful, but the fairly recent operation of fenestration sometimes gives good results.

DISEASES OF WOMEN.

The internal sexual organs of women, like the urinary system, can best be described as shaped like a capital Y. At the tips of the letter are the ovaries, the female sex glands; the two limbs running downwards are the Fallopian tubes; the point where they meet is the uterus or womb; and the single leg at the foot is the vagina. The ovaries have already been mentioned. They give out two hormones which control the sexual life: œstrin, which, in a very general way, may be said to be stimulating, and progesterone, which, during pregnancy, has a sedative effect on the womb. These two hormones also control the menstrual cycle: (*a*) by producing an ovum each month which passes down the Fallopian tube to the womb ready to be fertilised (this happens about the fourteenth day—half-way between two periods), and (*b*) when fertilisation does not occur, bringing about the removal of the lining of the womb—which is the meaning of menstruation—and then proceeding to build it up again.

The breasts, too, are secondary sexual organs, and are also under the influence of the ovarian hormones. One of the commonest and most trivial complaints encountered by the doctor is that they are either too small or too large. However, small breasts cannot be made larger, and are just as efficient for feeding babies as large ones, which are not always so effective as they appear. If breasts become too large they can be dealt with by plastic surgery. Two more serious conditions are *mastitis* and *cancer of the breast*, both of which are characterised by lumps within the breast tissue. It is not proposed here to discuss these two conditions in detail except to say that mastitis may be uncomfortable but is not necessarily dangerous, and can usually be treated medically, whereas cancer is obviously extremely grave. The reason nothing more is being said is that any woman with a lump in her breast must go *at once* to a doctor—reading about it is useless,

and, although nothing serious may be wrong, there can be no doubt that, if there is, every day wasted lessens the chance of prolonging life.

Abscesses also occur in the breast, nearly always during the time when the mother is feeding her child. Here again a lump appears, but in this case it is accompanied by redness over the area and fever. Treatment is surgical.

Oophoritis and Salpingitis. The former means inflammation of the ovary, which is ordinarily not due to infection but to some internal defect. The symptoms are usually low back pain (which is a very common gynæcological symptom) and heavy loss during the periods. Treatment is entirely a matter for the gynæcologist. The latter disease is an infection of the Fallopian tubes, often following abortion, but sometimes conveyed by the blood from another septic source in the body. There is high temperature, pain in the lower abdomen, and frequently vaginal discharge. Since the disease can become chronic and is likely to lead to sterility, immediate attention should be sought. *Ovarian cysts* are of different types and of varying degrees of severity; before the era of effective surgery it was not uncommon for certain types of cyst to become larger than the patient. But needless to say, this does not occur now.

The womb, or uterus, is subject to many diseases, but here we shall only mention *fibroids*, a non-malignant tumour, which, however, may necessitate major surgery. The main symptom of fibroids is severe menstrual loss.

Cancer of the Womb is of two types, cancer of the body or of the cervix. The womb is pear-shaped, and the body is the main part, whereas the cervix is the narrow part which projects into the vagina. Cancer of the cervix usually occurs in middle-aged women with a large family, whereas cancer of the body of the uterus occurs slightly later in life (fifty to sixty) and most commonly in those who are childless. The symptoms will not be described in detail, but any woman who, after the menopause, has slight bleeding, especially after intercourse, and fairly constant watery discharge, *must* see her doctor at once. The treatment of cancer depends upon circumstances. Operation is nearly always necessary, but in certain cases radium will be used. Finally, the uterus may have an infected lining, *endometritis*, another cause of discharge and low back pain, or its ligaments which ordinarily support it in the pelvis may sag with age or frequent childbirth, and *prolapse* may occur. In prolapse, the womb sags down into the vagina, and the cervix may even appear outside. The usual symptoms, apart from visible evidence, are low back pain and a heavy, dragging feeling in the lower abdomen.

Discharge, or Leucorrhœa (strictly speaking, leucorrhœa refers to white discharge), may be, as we have seen, due to many causes—in fact, to infection of any part of the genital tract. In the upper part, the womb and the Fallopian tubes, the most common cause of infection is following a childbirth in which all the products have not been removed or after abortion, but discharge is also common when the vagina has been infected with various types of germs and fungi. Generally, it is advisable for a patient who has discharge which is (*a*) too copious, (*b*) blood-stained, (*c*) offensive, or (*d*) irritating, to see a doctor as soon as possible. On the other hand, there is a perfectly normal discharge, more plentiful in some women than others, which may become offensive if personal hygiene is inadequate. This need not be the subject of concern, but women would be well advised to adopt here the continental habit of douching—not with antiseptic, but with ordinary warm water.

Dysmenorrhœa, or pain with the periods, is very common, and occurs in many different conditions. However, in those who have not had children, and especially in young girls, it is likely that there is a large psychological element involved. In a symptom which has so many varying causes the sensible thing to do, if the pain is troublesome, is to see the doctor.

Many women are very troubled at the prospect of the change of life or *menopause*. This, in itself, is not unnatural; for nobody likes growing older. But this quite natural fear is overlaid with all sorts of additional ones based on sheer nonsense; women often talk to each other as if the change of life means the end of being a woman, as if it must be accompanied by all sorts of painful and uncomfortable symptoms, such as "hot flushes," depression, severe losses of blood, and so on. Now the menopause has no influence whatever upon the sexual life (although naturally it has upon fertility); desire is not affected, and indeed it is recounted that a famous courtesan, at the age of eighty, on being asked by Voltaire when women ceased to feel desire, replied: "I don't know—I haven't lived long enough." The "hot flushes" appear to be a disease of civilisations, since they are rarely found amongst simpler peoples. In any case, they can be treated by hormones and clear up fairly readily. The same applies to heavy losses of blood. There is no reason at all why women should suffer during the menopause.

Abortion is a word which, to the doctor, does not have the unpleasant connotation which it apparently has to those who perhaps too avidly read some of the Sunday newspapers. It does not necessarily signify any criminal act, and its simple definition is: "Expulsion of the uterine contents before the viability of the fœtus (*i.e.*, the twenty-eighth week)." This means that an abortion or miscarriage is the termination of any pregnancy prior to the time when the fœtus is able to survive. The two main symptoms of abortion are: (*a*) bleeding, and (*b*) abdominal pain. The bleeding may be slight initially, but obviously any bleeding during pregnancy ought to be reported at once. Pain is in the lower abdomen and spasmodic in character; like colic, it works up to a height and then temporarily passes off. Any pregnant woman with pain and bleeding should at once go to bed and send for the doctor. *Criminal abortion* is brought about deliberately, either by the use of drugs or by injecting substances into the womb. Both these practices, although very common, are extremely dangerous; there are no drugs taken by mouth which can produce abortion without also endangering life, and injecting water or anything else into the womb is liable to lead to sepsis and death. The frequency of abortions in general is about one in every five pregnancies.

Amenorrhœa means stopping of the periods. It may signify either pregnancy, glandular disease, or can be purely psychological.

Contraception.

This is another subject which will be only briefly dealt with, since if one does intend to practise birth control one should either go to the local Birth Control Clinic or to a gynæcologist. The matter of whether or not a baby is born is too important to leave to chance, so any method used should be effective. Basically, there are four methods of contraception: (1) chemical, whether with tablets, douches, or jellies; this is increasingly reliable, but certainly not 100 per cent. effective: (2) The use of appliances, such as the sheath in men or the cap which fits over the opening of the womb in women (these, properly fitted, and combined with a chemical contraceptive jelly, are almost 100 per cent. effective); (3) The type of method which is "physiological" —that is, which makes no use of any artificial appliance or chemical; one such method is simply to cease intercourse before emission takes place—to say the least of it this method is unreliable. The other is the use of the "safe period," which is recognised by the Roman Catholic Church and based on the fact that ovulation occurs at some time in the mid-period, usually about the fourteenth day. Intercourse outside this period is unlikely to lead to pregnancy, since, in effect, there are only about four days in the month when this could occur. The only problem is: which four days? It is possible to find this out by daily readings of the vaginal temperature carried out over some months, but it must be repeated that advice about birth control should be accepted from nobody but a thoroughly qualified specialist.

PART III. INDEX AND GLOSSARY

Malaria, 17.
Malnutrition, diseases of, 41 (1), 16 (2), 72.
Malta fever (undulant fever), 15 (1).
Manic-depressive insanity, 50 (2).
Mastitis, 55 (2).
Mastoiditis, 55 (2).
Masturbation, 51 (2).
Measles, 10 (1).
Measles (German), 10 (1).
Melancholia. *See* **Manic-depressive insanity**, 50 (2).
Meningitis, 14 (2).
Menopause, 56 (2).
Mental diseases, 49–52.
Migraine, 47 (1).
Montagu, Lady Mary (1689–1762). English wit and letter writer, 16 (1).
Mumps, 10 (1).
Myocarditis, 27 (1).
Myxœdema, 41 (2), 42–43.

National Health Service, 6, 62–5.
Nephritis, acute and chronic, 44 (2).
Nephrosis, 44 (2).
Nettle rash, 53 (1).
Neurasthenia, 51 (1).
Neuritis, 49.
Nephrosis, 44 (2).
Neurosis, 50–51.
Nervous system, diseases of the, 45–49.
Night-blindness. *See under* **Vitamins**, 42 (2).
Noguchi, Hideyo (1876–1928). Japanese bacteriologist, 16 (1).
Nuclear radiation, effects of, 21–22, F 46–8.

Œdema (dropsy), 44 (2).
Obesity, 40.
Obsessional neurosis, 51 (1).
Œsophagitis, 34 (1).
Olfactory. To do with the sense of smell.
Oophoritis, 56 (1).
Ophthalmia, 15 (2).
Orthopædics. A branch of medicine dealing with the surgery of bones and joints.
Osteoarthritis, 54 (2).
Osteomalacia, 41 (2).
Osteomyelitis. An inflammatory disease of bone caused by infection with the streptococcus or staphylococcus. The germ is carried by the blood, but the part where it settles depends on local weakness or such factors as blows and injuries. The first sign is severe pain in the infected bone and fever. Usually the site affected is in the long bones of the arm or leg. Later, a chronic state may develop in which a small sinus, or hole in the limb, discharges large amounts of pus which comes from the inside of the bone. Operation may be necessary, but if caught in an early stage, the disease may be treated with penicillin or sulphonamide drugs. The main danger of osteomyelitis is that absorption of the bacterial poisons into the system leads to damage to the other organs of the body.
Osteoporosis, 42 (1).
Otitis media, 55 (2).
Otosclerosis, 55 (2).
Ovarian cysts, 56 (1).

Palpitation. *See* **Tachycardia**, 28 (2).
Pancreas, 38–39.
Papilloma, 44 (2).
Paralysis (flaccid and spastic), 46 (2).
Paralysis agitans, 11 (1), 49 (2).
Paranoia, 56 (2).
Paraphrenia, 50 (2).
Parasites, 8 (1).
Parathyroid glands, 43 (1).
Paré, Ambroise (*c.* 1510–90). French army surgeon, 4.
Parkinson's disease, 11 (1), 49 (2).
Pasteur, Louis (1822–95). French chemist, 5 (2), 16 (1).
Pediatrics. The study of the diseases of children.
Pellagra, 42 (1).
Penicillin, 4 (2).
Peptic ulcer, 34.
Pericarditis, 27 (1).
Peritonitis, 39 (2).
Pernicious anæmia, 24 (2).
Peroneal muscular atrophy, 48 (2).
Petit mal. *See* **Epilepsy**, 47 (2).
Pharyngitis, 31 (2).
Phlebitis, 29 (2).
Physical injuries, 19–22.
Piles. *See* **Hæmorrhoids**, 37 (2).
Pink disease, 48 (1).
Pituitary gland, 43 (2).
Plague, 16–17.
Plastic surgery, 5 (1), 54 (1).
Pleurisy. The lining of the chest wall, which also forms a covering for the lungs, is known as the pleura. When this becomes inflamed, the illness is called pleurisy. Pleurisy is almost always due to infection with a germ, and most often occurs in the course of another illness, such as measles, scarlet fever, tuberculosis, abscess, or sometimes following a blow to the chest. In the early stage, inflammation causes friction between the two layers of pleura, and this causes pain, but later fluid is secreted, and "pleurisy with effusion" results. Treatment in mild cases is mainly a matter of rest, but when fluid has formed it may be necessary to withdraw this with a needle or even by a surgical operation. Nowadays, penicillin or the sulphonamide drugs can be used. The commonest symptoms of pleurisy are pain in the chest, cough, and fever. When fluid has formed, the pain tends to disappear.
Pneumonia, 10 (2), 31 (2).
Poisons, 22.
Poliomyelitis, 11 (1), F 54 (2).
Polycythæmia, 25 (1).
Polyneuritis, 49 (1).
Prognosis. The medical name for the outlook of a disease.
Progressive muscular atrophy, 48 (2).
Prolapsed intervertebral disc, 49 (2).
Prolapse of uterus, 56 (1).
Prostate disease, 45 (2).
Protozoal diseases, 17–18.
Pruritis, 52 (1).
Psittacosis, 12 (1).
Psychosis, 49–50.
Psychosomatic diseases. Psychosomatic diseases are those physical ailments due to emotional causes. They include such complaints as high blood-pressure, gastric ulcer, certain skin diseases, and certain glandular diseases (*e.g.*, exophthalmic goitre). Most physicians nowadays believe that all diseases may show a greater or less degree of emotional causation; that physical and mental factors are both present in all illness. Even in psychosomatic illnesses, heredity and other factors play a large part. Briefly, the main cause of these diseases is worry. The importance of this lies in the fact that they cannot be cured without dealing with the fundamental cause. *See also* **New Views on Medicine**, 4 (1), F 53 (2). Individual illnesses will be found under their names.
Psychopathic Personality, 51 (2).
Pulmonary embolism, 29 (2).
Purpura, 25 (2).
Pyæmia, 14 (2).
Pyelitis, 44–45.
Pyloric stenosis, 35 (1).
Pyorrhœa. An infection of the gums which causes the edges of the tooth sockets to bleed easily when the teeth are being brushed. There is a constant discharge of pus, which causes the breath to smell and may lead to arthritis and other diseases. Treatment should be carried out by a dentist.

THE NATIONAL HEALTH SERVICE

The interest of the State in the health of the people is not a new thing. As long ago as 1642 Parliament accepted the principle that those who fought in the service of the State and were sick or wounded must be cared for by the State. This principle was applied in the wars with the Dutch of 1653 and 1664. There was however, no extension of this state care to civilians for a very long time, and it was not until the appalling living conditions resulting from the Industrial Revolution threatened to spread disease throughout the country that any further national action was taken. The first medical officers of health were appointed just over one hundred years ago, and their main task was to deal with the fearful epidemics, such as cholera and smallpox, which were then prevalent. For the remainder of the nineteenth century the control of infectious disease and the improvement of sanitation and water supplies were the main concern of Parliament and the local authorities, and much progress was made in the prevention of disease. The diagnosis and treatment of illness remained a personal matter between the patient and the doctor. It is true that the State made provision for destitute patients under the Poor Law and that the voluntary hospitals provided free treatment to those who could not afford to pay, but there was no general organisation of medical care. Many people subscribed to clubs and societies to provide medical treatment when they were ill, and it was not until the beginning of the present century that the State began to take an active interest in the medical care of the individual. The health of school children was protected by the formation of the school medical service in 1907, and about this time measures to protect the health of expectant mothers and young children were introduced. The National Health Insurance Act of 1911 provided for the first time a service whereby the bread-winner of a family when he was ill could receive treatment by his " Panel " doctor and obtain certain other benefits. These benefits were limited and the National Health Insurance Scheme did not cover the dependents of the insured persons, not did it make provision for hospital care.

From the time of the Great War of 1914–1918 up to and during the last war remarkable advances were made in medical and surgical skill, and these advances are continually being added to. New aids to diagnosis and new forms of treatment, for example the sulphonamides and penicillin, were discovered, and the great advances in medical care and in surgery were aided by blood transfusion, improved X-ray diagnosis, physiotherapy, and many other new services. The range of treatment now available is wide. It is also very costly. Indeed, many hospitals found it difficult to carry on before the last war, and many patients were unable to afford the expensive investigations and treatment which modern science has made available. For these reasons alone some form of national health service was inevitable, but there were other equally important reasons. For a long time doctors and others who have studied the subject of medical care had felt that a national medical service was essential in order to make the best use of hospitals in each area and to bring the full range of modern medicine within the reach of everyone. Towards the end of the last war a number of social measures were introduced, such as the National Insurance Act and the National Assistance Act. These measures and all the other welfare measures introduced at that time depended on a national health service for their medical requirements. It was to meet these needs that the National Health Service Act was passed in 1946. The new Scheme came into operation on July 5th, 1948.

THE NATIONAL HEALTH SERVICE ACT 1946.

This Act was intended to provide a comprehensive health service in England and Wales. Similar Acts were passed for Scotland and Northern Ireland. The health services to be provided fell under three principal headings:—

(1) Hospital and Specialist Services.
(2) General medical, dental, and pharmaceutical services outside the hospital.
(3) Local Health Authority Services.

HOSPITAL AND SPECIALIST SERVICES.

The Hospital and Specialist Services make provision for every kind of hospital care, including general hospitals, maternity hospitals, infectious disease, and special hospitals such as the mental hospitals and mental-deficiency institutions. They also provide for convalescent treatment and rehabilitation. These hospitals are staffed by consultants and specialists, numbering approximately 6,900 employed on a full-time or part-time basis, who work in the wards, out-patient departments, and in special units, such as X-ray and pathology departments. At the request of the general practitioner, domiciliary visits to the patient's home are made by consultants in cases of emergency. The hospital consultants are assisted by medical and surgical registrars, and by house surgeons and house physicians, many of whom reside in the hospitals.

The total number of available beds in hospitals in the National Health Service in England and Wales is about 477,000, of which nearly 50 per cent. are in mental hospitals and institutions. To nurse the patients in these hospitals there are more than 190,000 nurses and midwives, including student nurses, and a maintenance and domestic staff of 177,000 is also employed. In addition, there are many special workers, such as almoners, records officers, radiographers, physiotherapists, speech therapists, teachers of occupational therapy, etc., so that it will readily be understood that the hospital service is one of the greatest employers of labour, expecially of women, in the country.

There are also many special activities within the hospital service, including the supply of surgical and other appliances. To give only one example, more than 630,000 hearing aids have been distributed from the special distribution centres since the service began.

A most important part of the hospital and specialist services is the National Blood Transfusion Service, which takes blood from a civilian Donor Panel of about 716,000 people and distributes this to the hospitals as required. In a recent year (1958) the total distributions of blood were 775,792 bottles, each containing about ¾ pint and being the gift of one donor. An important part of the work of the Blood Transfusion Service is the testing of the blood of expectant mothers for the rhesus (Rh) factor. Many maternal and infant lives have been saved by detecting this incompatibility.

On July 5th, 1948, the Minister of Health became responsible to Parliament for the efficient administration of hospital services. To secure this he set up fourteen Regional Hospital Boards,* four for London and the Home Counties, and ten for the remainder of England and Wales. The 36 great teaching hospitals in England and Wales have their own governing bodies responsible direct to the Minister. In Scotland the arrangement is that all hospitals are included in the Regional Hospital Board areas. The Regional Hospital Boards are responsible for planning and administering the hospital and specialist services of their areas. For day-to-day administration they are divided into small groups under the care of 388 local Hospital Management Committees. This arrangement also ensures that the best use is made of the hospital beds in each area and that the limited building and staff resources available are not wasted by competition between adjoining hospitals. At the same time it is the duty of the Regional Hospital Boards to arrange for the medical staffing of the hospitals and to see that special facilities are available for the treatment of patients requiring chest surgery, plastic surgery, brain surgery, and other special forms of treatment which can best be provided on a regional, rather than a local basis. The members of the various boards and committees serve entirely voluntarily and receive no payment for their work.

* *Shortly to be increased to fifteen by the division of the South-Western Region into two.*

They number between nine and ten thousand people. Were it not for these voluntary workers the permanent administrative staffs, secretaries, accountants, clerical officers, etc., would require to be much larger than is now the case.

Many patients stay in hospital only a short time, or receive all the care and investigation they need in the out-patient departments, and it is necessary to ensure that there is a close link between the hospital and home care services. This may be ensured in a variety of ways, notably by communication between the consultants and the general practitioners engaged in medical care in the home, and also by close liaison between the hospitals and the Local Health Authorities in the area.

GENERAL MEDICAL AND DENTAL SERVICES OUTSIDE THE HOSPITAL.

The number of persons in England and Wales whose names are recorded as being on doctors' lists is about 45 million, *i.e.*, over 97 per cent. of the population. The general medical services, which include medical and dental services, pharmaceutical services, and supplementary ophthalmic services, are administered locally by Executive Councils. The areas of the Councils coincide with those of the Local Health Authorities, except where two or more Executive Councils have been merged by agreement.

The members of the Executive Councils, who give their services voluntarily, include twelve lay and twelve professional people. The latter include doctors, dentists, and pharmacists. The work of the Councils is mainly executive, but they may deal with complaints and disagreements, and also with applications from doctors who wish to set up practice in their area or to succeed to a vacancy.

(*a*) **Medical.** Under the Service every person in the country is entitled to advice and treatment from a doctor. This care includes the prescription of medicine and appliances and arrangements for specialist advice and hospital treatment where necessary. There are approximately 21,000 general medical practitioners in the Service.

(*b*) **Dental.** Every person is entitled to dental treatment, including emergency treatment as well as the provision of dentures and the preservation of existing teeth.* There are about 10,300 dentists in the Service, and they give full courses of treatment to about 10 million people each year to make them dentally fit. In view of the importance of doing all that is possible to preserve teeth (rather than wait until they are so bad that the only remedy is to remove them), priority is given to expectant and nursing mothers and to children. The school dental service, operated by the Local Health Authorities, plays a vital part in securing the dental fitness of children, including education in the care of the teeth.

(*c*) **Care of the Eyes.** The Service provides for sight testing and supply of spectacles, either at hospital or by means of the supplementary eye service whereby patients may get their eyes tested by general practitioners with special knowledge of the diseases of the eye, or by sight-testing opticians. Opticians undertake the supply of spectacles.* Approximately 4,500,000 spectacles are supplied each year.

(*d*) **Pharmaceutical Services.** The prescriptions given by the doctors under the National Health Service are dispensed by chemists and pharmacists. The 15,000 chemists in the Service dealt with 203 million prescriptions in 1958, at a total cost of £65 million, *i.e.*, 6*s*. 6*d*. per prescription.

LOCAL HEALTH AUTHORITY SERVICES.

The Act has placed important new duties on the County Councils and County Borough Councils. There are 146 of these Local Health Authorities in England and Wales, and they administer their health work by means of a Health Committee and the medical officer of health and his staff. These local authorities provide services which help both the hospitals and the general medical services outside the hospital. For example, they provide a midwifery service in the home, and arrange for home nursing, domestic help, ambulance services, and a number of other facilities. It will be best to describe these services one by one.

(i) **Midwifery.** The County Council or County Borough Council arranges for trained midwives to care for the expectant mother in her own home either by employing the midwives directly or by arrangement with the district nursing associations. There are approximately 7,500 domiciliary midwives in England and Wales. Arrangements are also made for care before and after the confinement. The midwives must be able to call for medical aid when they are in difficulty General practitioners skilled in midwifery are available in each area, and they may in turn call on the obstetric consultants of the hospital service. Thus these home services are linked with the maternity departments of the hospitals. Many women nowadays prefer to have their babies in hospital because the home conditions are not suitable or because of other young children in the house. In such a case the expectant mother may make arrangements direct with the hospital and may have her ante-natal care done in the hospital clinic. If on examination everything is found to be normal the mother may be referred back to her own doctor or to the local maternity and child welfare clinic for regular ante-natal examination. Obviously it is not possible or desirable for every mother to have her baby in hospital, and where home conditions are suitable she may prefer to stay at home. The provision of home helps will assist with the domestic work, and many women also prefer to have the care of their own doctor. Some mothers, particularly those who have already had children, may not go in the first instance to the hospital or to their doctor but will go to the midwife whom they know. The midwife, in addition to arranging for the confinement, will advise the mother to be examined regularly at the welfare clinic or by her own doctor. It is also important that every mother, after confinement, should be examined before resuming work and again a few weeks later. Only by this means can any minor defects resulting from the confinement be found and corrected before they give rise to permanent disability. This post-natal examination can be carried out by the general practitioner, or at the clinic or hospital outpatient department. It is one of the essential features of a comprehensive midwifery service.

(ii) **Child Welfare.** For the first year of life, the health of the mother and the infant are so closely bound up that they may be considered as one person. There are, however, a number of conditions affecting the child which may require specialist knowledge, and indeed disorders and diseases of childhood have for a number of years been a separate branch of medicine under the title of Paediatrics. The physicians specialising in diseases of children are therefore known as paediatricians, and it is one of the duties of the hospital service to provide a paediatric service with children's beds, outpatient and clinic facilities, and trained staff. It is, however, necessary to go farther than this. The study of diseases of children has shown that many of these can be prevented or diagnosed at an early stage. It was to detect such departures from the normal that the maternity and child welfare clinics were first set up, and the work they have done has been invaluable. It is clearly most important to see that the young child is examined regularly by the family doctor or at the Welfare Clinic.

(iii) **Vaccination and Immunisation.**

Smallpox. It is advisable to consider at this stage another provision of the National Health Service, which deals with vaccination against smallpox. Compulsory vaccination against smallpox has been abolished by the National Health Service Act, but every Local Health Authority must arrange for anyone who wishes to be vaccinated free of charge. This can be done either by the patient's own doctor or at the local authority clinics. Although compulsory vaccination is abolished it is nevertheless still advisable that every person should be vaccinated in infancy. Smallpox is now rare in this country, but when it does occur it is just as serious as ever it was and can quickly prove fatal. Only by vaccination can its epidemic spread be prevented.

* *The National Health Service Act, 1951, imposed certain charges on dentures and spectacles, and these have been continued by subsequent ensuing Acts.*

Diphtheria immunisation has produced the most remarkable results in reducing the number of deaths from diphtheria in the British Isles. Local Health Authorities now arrange for free immunisation against diphtheria to be available to everyone, either by the patient's own doctor or through the local health clinics. It is of course, essential that every infant should be immunised against diphtheria.

Whooping Cough. The child may also be immunised against whooping cough, where the family doctor or the doctor at the Welfare Clinic considers this to be advisable.

Poliomyelitis. Responsibility for vaccination against poliomyelitis has been placed in the hands of the Local Health Authorities.

Tetanus. Some Local Health Authorities include the provision of immunisation against tetanus in their approved arrangements for vaccination and immunisation.

(iv) **Home Nursing.** The responsible duty has been laid on the Local Health Authorities of ensuring that trained nurses are provided for people who require nursing in their own homes. The Local Health Authority does this either directly or by entering into arrangements with district nursing associations. District nurses in some areas act also as the district midwives and health visitors. The need for an efficient home nursing service becomes obvious when it is remembered how many people have to be cared for in their own homes, and in particular those suffering from chronic diseases and the aged and infirm. There is, however, another reason. An efficient home nursing service means that patients who now go to hospital for relatively minor conditions can be nursed at home, and other patients can be discharged from hospital earlier to be nursed at home. By this means valuable hospital beds can be saved for serious cases. The home nursing service is organised so that the district nurse is in the closest possible touch with the general practitioners whose cases it is her responsibility to nurse. Normally it is for the doctor in charge of the patient to arrange for the services of the home nurse, but in an emergency she can be called in direct. In 1958 home nurses in England and Wales, numbering about 10,000, paid over 24 million visits.

(v) **Domestic Help.** If sick or aged persons are to be cared for at home the provision of home help is often necessary, and it is also important that a mother who has her baby at home should not be burdened by domestic care. Local Health Authorities now have the power to provide domestic help for these mothers and for any household where there is a sick person, a mentally defective, or an aged person, or where there are young children. Clearly this is a most important service. It is useless to provide home midwifery and home nursing services without someone to do the general work. At the present time there is a serious shortage of woman-power, but this home help service offers a new field of work, whole-time or part-time, for the middle-aged and elderly woman. The Local Health Authority may make a charge for the services of home helpers. In 1958, home help was provided in 271,968 cases.

(vi) **Health Visitors.** Health Authorities have for a long time employed specially trained nurses to act as health visitors to give advice at home or at clinics to expectant mothers and mothers with young children. These health visitors have proved so successful that under the National Health Service their duties were extended to the giving of advice on the welfare of the family. They also advise, in conjunction with the family doctor, on the prevention of the spread of illness within the home. This advice is particularly necessary in such diseases as tuberculosis. There are approximately 7,000 health visitors, whole or part-time, in England and Wales.

(vii) **Ambulance Services.** A most important duty laid on the Local Health Authority is the provision of ambulance services. Every Local Health Authority must arrange for ambulances and, when necessary, sitting-case cars to convey sick or injured persons or expectant mothers or nursing mothers or other types of patients to and from hospital as required. These ambulances and cars travel about 100 million miles in a year and carry 15 million patients at an average cost of 17*s.* 5*d.* per patient. The ambulances are also available to take cases of infectious diseases to and from hospital, but special precautions are taken to prevent the spread of such diseases.

(viii) **Care and After-care of the Sick.** It is not enough to make provision for efficient hospital treatment unless some arrangements are made whereby patients can also receive proper care and attention in their own homes. The National Health Service Act gave the Local Health Authorities power to make arrangements for the prevention of illness and the care and after-care of persons suffering from illness, including mental illness, and the care of the mentally defective. This care and after-care of the sick may include such things as the provision of special foods, blankets, and extra comforts required by the sick person. Equipment for home nursing may be provided so that district nurses and midwives can obtain such items as water-beds, bed-rests, bed-blocks, crutches, and wheel-chairs for their patients. Local Health Authorities can make grants to voluntary organisations for doing work of this kind, but they cannot make any cash payments to the patient, as this is provided for under other Acts of Parliament, such as the National Assistance Act.

(ix) **Tuberculosis.** The extent of care and after-care provided will be governed very largely by the needs of a particular area and the resources of the local authority concerned, but the Minister of Health has given specific directions that every Local Health Authority must make arrangements for the prevention of tuberculosis and the care and after-care of persons suffering from this disease. By this means any person suffering from tuberculosis may be helped before entering and after discharge from the sanatorium or hospital, and the health of his family is also safeguarded. Local Health Authorities must not make any charge for the care of the tuberculous patient. Local Health Authorities are also empowered to offer B.C.G. vaccination against tuberculosis to certain selected groups of the population including school children between the ages of 13 and 14 years. By the end of 1958 a total of 1,215,553 persons had been vaccinated with B.C.G., under Local Health Authority schemes.

(x) **Health Centres.** Under the National Health Service Act provision was made for the building and equipment of health centres. These are intended to be places where general medical practitioners and dental surgeons may see their patients, and specialists from the hospital may attend if necessary. There may also be other clinic facilities. It will take a long time before the ideal type of health centre has been devised, and the restriction on building may also hinder the general development of health centres. Meanwhile there is scope for experiment, and a number of different kinds of health centres are coming into use in various parts of the country, particularly in the new towns and housing estates.

MENTAL HEALTH SERVICES.

The importance of safeguarding mental health, in addition to providing treatment for mental illness, has come increasingly to be recognised in recent years. In this connection it is necessary to distinguish between mental disease, which affects the developed mind, and mental deficiency due to failure, or partial failure, of the mind to develop fully. In the one, treatment and cure may be, and very often are, possible. For the other, *i.e.*, mental defectiveness, true cure is usually impossible, but much may be done to help and teach the mentally defective to become useful and happy members of society.

In addition to disease of the mind, and the existence of mental deficiency, it must also be remembered that mind and body are so closely associated that disability of the one may affect the other. Thus the simplest of bodily ailments, such as a cold in the head, or a bilious attack, may cause temporary mental depression. The pace of modern life is also a factor of importance in the production of mental stress and anxiety.

The care of the mentally ill has in the past been handicapped by the fear which many people had of this type of illness, and also because it was believed to be incurable. Modern experience has shown that illness of the mind is often as amenable to treatment as bodily illness, particularly when

treated early, and both mental and general hospitals now have many patients receiving out-patient care in the same way as those with physical disabilities.

It has also been demonstrated that prevention is better than cure, and the subject of preventive psychiatry is now an important one, particularly in the formative years of life.

The National Health Service makes special provision for mental illness. The mental hospital usually provides both in-patient and out-patient accommodation, and psychiatric clinics are also held at many general hospitals. Long-stay annexes are provided for old people who are mentally infirm, and day hospitals are being developed whereby patients may spend the nights in their own homes, and attend the hospital during the day. Increasing attention is also being paid to rehabilitation of the mentally ill. Mental defectives may be retained in special hospitals or colonies, or they may remain in the community under the care and supervision of the Local Health Authorities.

Mental hospitals and metal-deficiency colonies now form part of the hospital and specialist services. The care and supervision of mental patients and mentally defective people in their own homes is carried out by officers of the Local Health Authority. These officers have special experience in dealing with this type of patient, and the hospital specialists are also available to help. They are assisted by trained psychiatric social workers, one of whose functions is to investigate the social background of the patient and to assist him to return to his place in society when treatment has been completed.

The Report of the Royal Commission on the Law Relating to Mental Illness and Mental Deficiency, published in 1957 (Cmd. 169, H.M.S.O.) recommended that the trend from institutional to community care should be augmented. Under the Mental Health Act of 1959 the local health authorities are given increased responsibilities for the care of the mentally ill, by providing residential accommodation, training centres, the appointment of mental welfare officers, and acting as guardians.

THE AGED AND THE INFIRM.

The introduction of a comprehensive health service has revealed many groups of people in the community who were, in the past, ill cared for, including those suffering from permanent disablement as a result of injury or disease, and also those who by reason of age and infirmity required prolonged care. The old Poor Law infirmaries provided accommodation for many of these people, and, once admitted there, they usually stayed for life. Today it is realised that many disabilities can, if treated early, be prevented from becoming serious, and that the best way to prevent the aged and infirm from becoming a burden to themselves and to others is to keep them actively interested within the community. Rehabilitation after accidents, injury, or disease, is therefore an important part of the health service, and many different ways of ensuring this are employed. Convalescent homes, a short stay in hospital, and home-care schemes are some examples. So important has the care of the older members of the community become that special Geriatric Units have been established at many hospitals under the care of a physician known as a geriatrician. The preservation of the link between the hospital and the home is particularly important with these cases, for unless there is a reasonable prospect of return to their home after hospital care they will remain in hospital, and thereby block the beds required for others. In doing so, their own return to full usefulness in the community may also be delayed.

HOW TO OBTAIN THE SERVICES.

The detailed arrangements inevitably vary from district to district. It is therefore necessary to enquire locally for the precise arrangements, but the following general guide may help:—

1. **Hospitals and Specialist Services.** Through the family doctor.

In case of accident or grave emergency go direct to the hospital if a doctor is not available.

2. **Medical Advice and Treatment.** If you have not already done so, or when you move to a new area, you should choose your family doctor immediately. The simplest way is to ask him to accept you, and if he agrees to do this give him the official application form when you have filled it in. A separate form must be filled in for each member of the family. If you do not know a doctor you will find a list of those practising in the area at the Post Office.

In emergency apply to any doctor practising in the area who has joined the Service.

The names of doctors specialising in midwifery are kept on a special list. Your own doctor will advise you on this.

3. **Medicines and Appliances.** Take your doctor's prescription to any chemist. In country districts your doctor will advise you where to go. He may dispense the medicines himself.

4. **Dental Treatment.** Expectant mothers and children get priority care. Apart from these priority classes you may choose any dentist who provides dental treatment in the Service. The procedure is simple. You call on him by appointment, and he will begin treatment immediately after you and he have signed the appropriate form.

5. **Eye Services.** Your family doctor will recommend you to an eye specialist or ophthalmic optician. If your spectacles need repair you can go direct to the optician.

6. **Supplementary Services.**

(1) *Ambulances* through your own doctor. In emergency an ambulance may be summoned through the police or by dialling 999 on the telephone.

(2) *Home Nursing* through the family doctor or directly to the nurse in an emergency.

(3) *Midwifery Service* through the family doctor or the district midwife or the local welfare clinic or the hospital.

(4) *Health Visitor* through the family doctor or the local welfare clinic or local health department.

(5) *Home Helps* through your doctor or the district nurse, midwife or health visitor, or the local health department.

(6) *Vaccination and immunisation* through your own doctor or through the welfare clinic or local health department.

7. **Care and After-care of the Sick, including Equipment.** Arrangements may vary from one district to another. Your own doctor and the home nurse will be able to advise you.

For care in cases of tuberculosis ask at the hospital or chest clinic or the local health department.

On the home care of mental patients or mental defectives consult your own doctor in the first instance. In case of doubt enquire at the local health department.

Cost of National Health Services. The estimated cost for 1960–61 is £597 million.

THE FUTURE.

The British National Health Service is one of the greatest experiments in health care ever undertaken. For the first time in our history every man, woman, and child in the country is entitled to free medical care. At present the energies of those employed in the National Health Service are devoted mainly to curing the sick, but it must not be forgotten that the main purpose of this Service is to improve the health of the people. To be, and remain, healthy requires many things such as a healthy environment, good food, and healthy working and home conditions. Above all it depends on the intelligence and common sense of the individual concerned. Many of the conditions treated to-day by the doctors in their surgeries or at hospital could have been prevented altogether or cut short. The spread of such a disease as tuberculosis, for example, is preventable. Again, many people fear cancer and will not go to a doctor until it is too late. The ideal for everyone is a happy, healthy, well-balanced life. The National Health Service is a step towards this, but it remains for the individual to ensure that by common-sense application of the simple rules of health, and the avoidance of excesses, he makes the most of his life. State services can help a man, but they cannot live his life for him. That remains his responsibility.

BABY CARE

THE HEALTH OF THE MOTHER.

The health of a baby during its early years of life is so bound up with the health of the mother that the two must be considered together. Indeed the intimate relationship which exists between the two before birth is, in normal circumstances, continued after birth and throughout the whole of the first year. It is therefore necessary to consider first the health of the mother before the birth of the child.

It has now been established beyond doubt that the health of the expectant and nursing mother affects profoundly the health and well-being of her infant. It is not merely a question of good bodily health. Mental contentment and freedom from anxiety are also important. It is necessary, therefore, to encourage a placid state of mind from the outset. This can best be done by making the arrangements for adequate care and supervision as early as possible. As soon, therefore, as pregnancy is suspected the mother should seek the advice of her family doctor.

When the pregnancy is confirmed the question whether to have the baby at home or in hospital must be decided. Much will depend on the opinion of the doctor, who may consider confinement in hospital advisable on medical grounds. Other considerations will also enter into this decision, such as the suitability of home conditions, the care of other children in the family, the availability of domestic help and so on. If it is decided to have the baby at home, arrangements must be made for securing the services of a midwife. The sooner these arrangements are made, and other matters such as the provision of home help and care for the other children decided, the sooner will the mother be able to settle contentedly to prepare for the baby. Subject to the advice given by the doctor and midwife the more natural the life the expectant mother lives the better.

Experience in a number of countries, including Great Britain, in the Second World War, confirmed the view that the nutrition of the expectant mother is of vital importance, both to her own health and to that of the baby. That is so throughout pregnancy, and especially in the earlier months. From the moment that pregnancy is diagnosed, therefore, it is essential that the mother should have a good and varied diet, with plenty of fruit, salads, and vegetables, in addition to fresh meat and fish, milk, butter, eggs, and cheese, for it is from these materials that the essential proteins, the fats, carbohydrates, and mineral salts required by the developing infant are drawn. Adequate supplies of vitamins are also required, especially when the baby is growing rapidly in the later months of pregnancy, and these are usually supplied in the form of cod-liver oil or halibut-liver oil which contains vitamins A and D, and fresh orange or tomato juice or concentrated orange juice, rose-hip syrup, blackcurrant syrup, etc., which contain vitamin C. Multi-vitamin preparations containing a number of vitamins may be taken on the recommendation of the doctor or welfare centre.

Mineral salts, and especially calcium and iron, are essential for both the mother and the child, especially during lactation. Calcium is supplied naturally by means of milk, cheese, and vegetables, and iron by way of green vegetables, egg yolk, liver, peas, beans and lentils, oatmeal, and wholemeal flour.

The old tradition that the expectant mother should attempt to eat enough for two people is, of course, a fallacy. A good, well-nourishing diet taken at regular meal-times is all that is required. Similarly, the other elementary principles of healthy living should be followed, with adequate fresh air, exercise and sleep, and a rest during the day. Before attempting anything exceptional, such as hard exercise or swimming, medical advice should be taken.

MEDICAL SERVICES.

It is no part of these notes to describe the arrangements for the confinement, but it is obvious that this will be made much easier if adequate preparation has been made. The expectant mother should therefore make sure that she is getting all the help which the health and welfare services can give. These services are now very extensive, and they are available to everyone. Under the National Health Service, for example, the help and advice of a doctor and midwife are freely available, and so also are the welfare clinics of the local authority and the expert care of the hospitals. These services are described in detail in the notes on the National Health Service. (P62–5.)

The Local Health Authorities now provide a free ambulance service for those who may need it, and also a home help service whereby a helper experienced in the running of a home can come to assist the family during the time of confinement, and also if necessary during the nursing period. Local Health Authorities may make a charge for this home-help service.

If there are other young children in the family it may be possible to make use of day or residential nurseries where these are provided by the Local Health Authority, and old people in the house may be encouraged to go to an old people's club during the day, or be found temporary residential accommodation elsewhere. In making these arrangements the advice of the health visitor will be valuable. Local Health Authorities are empowered, under the National Health Service Act, to provide nursing equipment and additional comforts in the home. These may take the form of bedding and blankets, and nursing equipment may include such items as bed-pans, macintosh sheeting, air-rings, and bed cradles. Local authorities can make a charge for lending this equipment. Another helpful provision is that of a recuperative holiday after confinement.

It goes without saying that regular examinations of the expectant mother's health should be made, and these ante-natal examinations may be carried out by the general practitioner, at the welfare centre, or at hospital. Similarly, an examination to detect that no minor disability remains as a result of the confinement is also essential to prevent subsequent ill-health. This post-natal examination, which is usually made about six weeks after the confinement, may be undertaken by the family doctor or at the welfare clinic or the hospital.

GENERAL PREPARATION.

Two of the important things to prepare in advance are the baby's clothing, and equipment and furniture.

Clothes have undergone revolutionary changes in the past thirty years. Whereas it was formerly the fashion to provide elaborate sets of clothing, often in three or four layers, the objective to-day is to provide the simplest and lightest clothes which will keep the baby warm and comfortable and at the same time allow free movement and exercise. It is essential to remember when buying or making baby's clothes, and also later on when washing them, that a baby's skin is very sensitive and liable to chafe easily. The under-garments must be of soft and fine material that will wash and wear well, and the layer next to the baby's skin should be the same in summer and in winter and night as well as day. A common mistake is to put too many clothes on the body. A baby loses heat quickly from the whole skin, including the legs, and in cold weather the legs should be covered. The old tradition of wearing bonnets is now nearly dead. Provided that the baby is not directly exposed to draughts and keen winds, there is no need to wear any head covering except in very cold weather, when a woollen bonnet which covers the ears should be worn out of doors.

Vests should be of soft, fine wool, silk or silk merino, and long enough in the body to ensure that there is no gap between vest and napkin. A wide piece of tape can be sewn to the bottom of the front of the vest so that the napkin can be pinned to the vest without tearing it. The neck of the vest should be wide enough to go over the baby's head without force.

Napkins are usually of two kinds; soft muslin squares to be worn next to the skin, and turkish towelling worn over these as an added protection. The various ways of putting on and changing napkins are best learnt by demonstration by the midwife or at the clinic.

In cold weather the baby will need, in addition to vest and napkin, a woollen jersey and knickers and good woollen socks long enough to reach almost to the knee. As woollen socks are easily kicked off they should be drawn in by a ribbon and tied above the ankle. In really cold weather a long-sleeved double-breasted matinee coat of wool should be worn.

In hot weather the baby may need only vest and napkin, but care must be taken to add clothes as soon as it turns cooler. Incidentally it is wiser not to speak of summer and winter clothes when dealing with young children. In the British Isles, at any rate, a winter day can be warm, and cold spells occur in the summer. If the system is adopted of adding warm garments to the foundation of vest and napkin according to the temperature indoors or outdoors, the child will be most comfortable. In this, as in all other matters relating to the care of the baby, common sense plays a very large part.

Bibs are needed to save the clothes when the child dribbles or regurgitates its food after feeding. They should be of soft, absorbent material, such as drill or cotton, with tapes to tie round the neck and the waist. Bibs made of plastic material are not recommended, as they may cover the child's face if he falls asleep, and a young baby was stifled in this manner not long ago.

Binders are *not* necessary after the first ten days of the baby's life. Once the stump of the umbilical cord has separated and the scar at the navel has healed the binder should be discarded.

The equipment and furniture required are simple and will vary with the type of home and financial circumstances, but the underlying principles are the same for all homes. The first essential is cleanliness. This means not only provision for bathing the baby, but also facilities for washing the baby's clothes and napkins, and for the clean preparation of the baby's food and clean surroundings generally. It is essential also that the mother should be able to see to her own cleanliness and in particular the care of her clothes and hands.

A low chair on which the mother can sit to nurse and bath the baby is useful, and this can be improvised by cutting down an ordinary wooden chair. It can be painted a bright colour and it should be scrubbed at regular intervals—for example, once a month.

The cot for the young baby can, if necessary, be improvised from such things as a wicker basket. During the late war, cots were even improvised from orange boxes! It is, however, worth while to buy a wicker cradle and later a large dropside cot, as this will last well into infancy. A point to be remembered about cots and also about play-pens is that the bars should not be more than 3 inches apart, so that the baby cannot get his head through. Also there should be no collapsible parts which can suddenly give way and trap the fingers.

Bedding for the cot will include a blanket to go under the mattress. Next comes the under-blanket on top of the mattress. Over this comes the macintosh or other waterproof material with the flannelette drawsheet over it. The baby is wrapped in a shawl or soft blanket and covered with a top blanket. An extra blanket may be needed in cold weather. Many leading authorities on baby care recommend that a pillow should never be used, and certainly not a soft pillow, for babies have been known to be suffocated by these. When discussing later on the preparation of food, the washing of the baby and the washing of baby's clothes, reference will be made to some other items of equipment required.

With quiet and orderly preparation for the coming of the baby, pregnancy can be a very happy time. Indeed, that is what Nature intended it to be, and most women are never so well as during the months of pregnancy.

THE HEALTH OF THE BABY.

So far these notes have dealt primarily with the health of the mother. Independent life begins for the baby from the moment he is born. The stimulus of the external air makes him draw his first breath, and immediately his own circulation replaces that of the mother on which he has been dependent for the past nine months. But a new association begins. It is the baby's birth-right that he should be nursed and fed by his mother, and the intimate relations which exist between mother and baby render them, in effect, one person for nearly the whole of the first year of life. The more the mother knows about babies in general, and her own baby in particular, the better.

Care of the Newly Born Baby.

This is, of course, the province of the midwife, who, in addition to cleaning the eyes and freeing the mouth from mucus, will bath the baby and wrap up carefully to prevent chilling. After weighing, the baby is put into his cot while the midwife looks after the mother.

The Cord. Before birth the baby gets his nourishment from the mother through a cord which enters his body at the navel and at the other end is fixed to a large sponge-like structure (the placenta) attached to the inner wall of the mother's womb. Although the bloods of mother and baby do not intermingle, oxygen and nutritive substances in the mother's blood pass via the placenta into the baby's circulation and waste products are transferred from the fœtus to the mother's blood. The baby is part of the mother. That is one reason why the expectant mother should not over-indulge in tobacco or alcohol!

Directly after birth the midwife or doctor ties off the cord and the stump falls off in about seven days. The scar at the navel heals about the tenth day. If strict cleanliness is not observed in handling the baby during that time the cord stump may become septic and the baby's life be endangered. The directions of the doctor and midwife must therefore be followed carefully.

Weight and Length. The weight at birth varies usually between 6½ and 8 lb. It is sometimes as high as 10 lb. or as low as 5 lb. Boys usually weigh more than girls; the length of a baby at birth is usually 19 to 20 in.

The premature baby is not necessarily one which is born before the end of the normal pregnancy, and often babies born three weeks before they are expected are normal in size and do not require special care. The newly born baby weighing less than 5½ lb. is usually regarded as premature and treated accordingly. Premature babies have not got the natural resistance of the normal baby and require special care. For example, the results of a cold or influenza, or any septic infection, are more serious in these babies, and it is therefore necessary to exercise strict watch over them and keep them apart from other children and adults. Again, the body temperature of these babies is often low and requires to be kept up to normal by artificial means, such as hot bottles and extra clothing or electric blankets. Some babies are so small and delicate that they have to be nursed in an incubator. Premature babies are difficult to feed and they do not suck so vigorously as a normal infant. On the other hand, it is even more important that they should be breast-fed, if possible, than with normal infants. Extra care is therefore necessary with the premature infant, and many Local Health Authorities have arrangements for nursing these babies either at hospital or at home with a specially experienced nurse. It is important to remember that premature babies need special attention throughout the first year of life, for if neglected they are especially liable to bronchitis and pneumonia. The care taken by health and hospital authorities to save such babies is well worth while, for once they pass the critical early months they develop fully, both in mind and body, into normal healthy people.

The Skin. At birth the skin of a baby is red and covered with a protective fatty substance which comes off with the first bath; the redness persists for a few days. The skin of a baby is extremely delicate and needs very careful attention. This will be emphasised later when the question of washing and bathing is considered.

The Head of the new-born baby may look a little out of shape. This is because of the pressure during birth and it rapidly becomes normal. The bones of the skull are separated from each other in the new-born baby, and on the middle of the top of the head there are two diamond-shaped soft spaces where the skull bones meet. The space towards the front of the top of the head is known as the anterior fontanelle, and the doctor and midwife often gain useful information on the child's condition from the bulging or depression of this area. The other opening towards the back

of the skull is smaller and is known as the posterior fontanelle. This closes in six or eight weeks, but the anterior fontanelle remains open for about eleven to eighteen months.

Chest and Abdomen. No special comment is needed concerning the chest of the baby, but the abdomen is normally more prominent than in older children. This is due partly to the very large liver of the young baby and also to the fact that the stomach stretches to take in as much as 3 or 4 oz. of milk at one feed.

Nervous system. Even a newly born baby can grasp an object and hold it. It can also suck and swallow from birth, but the special senses are not well developed. Loud noises will startle the baby, but he cannot at first recognise where a particular noise comes from. Babies are particularly sensitive to bright lights, but for some time cannot properly control the movements of the eyes and head so as to be able to gaze steadily at anything. The sense of smell and taste develop in a few days. Movements of arms and legs are not co-ordinated at first, but at the end of the third or fourth month of life the child can usually hold up his head. At the end of five or six months the baby makes an attempt to sit up, although this may be delayed until the seventh or eighth month. By the ninth month the child begins to crawl and can usually stand at the end of ten months. At twelve or fourteen months he walks. The young baby is very sensitive to his surroundings. If these are unfamiliar he may, for example, refuse to feed. Also if the mother or a relative is nervous in handling him he will immediately become frightened. It is therefore very important to learn how to handle a baby properly and firmly so as to gain and hold the child's confidence.

Speech. Sounds are made a few weeks after birth, but single words are only said towards the end of the first year. Real talk does not occur until about twenty months or two years.

The Teeth. One of the reasons why it is important to ensure the adequate nutrition of the mother during pregnancy is that the infant's first, or milk teeth, are developing at this time, so that they are already present within the gums at birth. They appear through the gums in the following order —

Lower central incisors	5th to 6th month
Upper central and outer incisors	7th to 8th month
Lower outer incisors	10th to 12th month
First molars	14th to 16th month
Canine teeth (eye teeth)	17th to 18th month
Second molars	24th to 30th month

Although there are wide variations in the time of appearance of teeth, eight teeth should be present by the end of the first year, and all twenty of the milk teeth by the end of the second year.

The prevention of dental decay depends, therefore, partly on the good nutrition of the mother, but also on freedom from illness of the infant, especially one which affects the intake of food for any length of time. The preservation of the teeth depends on the presence of an adequate supply of mineral salts, and especially calcium, and also of vitamin D. Exercise for the jaws by the gnawing of hard crusts, or rusks, is also necessary.

GENERAL MANAGEMENT.

It is important to have a clear idea of the needs of the young baby, in order that a regular routine may be worked out which will place the least strain on the mother and give the baby the maximum degree of comfort and security. It is also necessary to know where to turn for guidance and advice in a difficulty. The family doctor is, of course, the stand-by in emergency and if illness is suspected. He is, however, a very busy man, and the young mother may not want to worry him with enquiries which, although important to her, are relatively trivial to him. The midwife, the health visitor, the home nurse, and the Welfare Centre are all available to advise. When in doubt do not hesitate to ask for advice. The mere sharing of an anxiety with another is helpful.

The baby's material requirements are simple. They are food, cleanliness, warmth, and sleep and, above all, an orderly routine.

The Daily Routine.

Opinion varies as to the frequency of baths for the newly-born infants, but it is now a common practice to bath the baby immediately after birth, and then to leave him until the stump of the cord has separated, at the seventh to the tenth day, the skin being cleaned, when necessary, with olive oil.

After this time the baby will take a bath each day.

A baby's skin is very sensitive and will quickly chafe and get sore if roughly handled. It is therefore necessary to exercise the greatest care in the choice of materials used for washing and in the handling and drying of the skin. Great care should be taken to select the finest soap and the softest of washing flannels or sponges. Towels must be soft, dry, and clean, so that the skin can be dried thoroughly by gentle rubbing. Gentle handling is particularly necessary for the creases of the skin and behind the ears. Some experts say that powder is unnecessary after bathing, but there is little doubt that a good dusting powder helps to preserve and soothe the baby's skin and to keep it dry.

If the skin becomes inflamed and sore expert advice should be sought, as the baby is very susceptible to septic infections which can enter through small abrasions or cracks in the skin.

Sun and Air.

Many skin conditions in infancy, and indeed other illnesses, are predisposed to either by neglect or excessive care. Leaving the baby to lie in wet and dirty napkins is one example, and at the other extreme is the failure to allow free access of air and sunlight to the skin by over clothing. The human skin has many important functions, including the maintenance of the temperature of the body, and it is also concerned with the manufacture of vitamin D by the action of sunlight on the skin. It is therefore essential that the body should obtain a reasonable amount of fresh air and sunlight.

Sore Buttocks. The best way to prevent a baby from developing soreness of the skin of the buttocks is early training in clean habits, as in many instances the inflammation of the skin is due to irritation set up by the child's urine or motions. Obviously a clean dry napkin will not cause this soreness, and the well-trained child soon learns to keep clean and dry. Accidents will, of course, happen and some little upset in the diet may cause frequent stools. It is therefore essential to change the napkins regularly and to clean the buttocks thoroughly after a motion. All fæcal matter should be removed with cotton wool swabs (which are put immediately into the "dirty" bucket), and the buttocks are then cleaned gently with warm water, dried and powdered. If the skin is red and sore, olive oil may be used for cleaning instead of water, and zinc and castor oil ointment or cold cream instead of powder. If the soreness is marked the daily bath can be stopped for a day or two, but expert advice should be sought if it does not clear up quickly.

CARE OF THE CLOTHES.

Apart from the fact that every mother likes her baby to look clean and neat it is essential to keep the clothes clean because of the sensitiveness of the young infant to infection of all kinds. Cracks or abrasions of the skin may turn septic if dirt comes in contact with them, and dirty clothes or towels are particularly liable to cause infections of this kind. Apart from this, badly washed clothes may also set up inflammation of the skin by being hard, and thereby chafing the skin, or because irritating fatty acids from the wrong kind of soap have not been completely rinsed out. The first essential is therefore to wash all articles which may come into contact with the baby regularly and frequently.

The mother must see that her own clothes and body are clean and in particular that her hands are washed thoroughly before the baby is handled. Her aprons and overalls should be washed frequently and discarded at once if soiled. This is particularly important if soiling takes place when the baby's napkins are changed.

Towels must be clean, soft, and thoroughly dry, before they are used.

Flannels and sponges should be washed frequently in hot water and thoroughly rinsed free of soap. Face flannels should be boiled once a week.

Napkins require special care. They should

first be sluiced under running water to wash out all solid matter, and then left in a bucket of cold water until ready for washing. Washing should be done in warm water with a good soap lather with thorough rubbing, and rinsed in several lots of water until all the soap is rinsed out. After wringing they are hung up to dry. Drying should not take place too quickly, as the napkins will then be hard. For this reason it is best to dry them out of doors. Mangling will help to make the napkins soft after drying.

Baby's Clothes. Different materials require different methods of washing, but the principles set out above hold good for all clothes. The washing must be thorough, in water which is hot enough to enable dirt to be removed but not so hot that the clothes cannot be well cleaned by hand. It is particularly necessary to see that neck and cuffs are cleaned properly, and the same comment applies to the lower edge of the vest which may be soiled from the napkin.

Bibs should be boiled at regular intervals, as they are liable to get smelly from regurgitated milk.

SLEEP.

If a baby is warm and comfortable and well fed its natural reaction is to sleep. The newborn infant sleeps for eighteen to twenty hours each day, waking only to be fed, and even at twelve months he will require fourteen or fifteen hours sleep each day. Sound sleep is essential to good health, and bad management of the young baby may result in faulty habits which last throughout life. Thus undue excitement before being put down to sleep, or irregular hours, may sow the seeds of insomnia. Ideally the baby should be made so comfortable that he will sleep from ten o'clock at night until six o'clock the next morning, but hunger may prevent this, and feeds may require to be re-arranged accordingly.

Restless sleep, with sudden nervous starts, is not a normal condition, and expert advice should be sought if this persists. A common cause is some digestive upset, such as colic or constipation, and coughs and colds also disturb the normal sleep rhythm, especially if there is a rise of temperature. It may then take a few days for the normal sleep habit to return.

CRYING.

It is normal for the young baby to cry, and a lusty yell is a good way to expand the lungs. Attacks of crying and screaming do not always signify pain or colic. Although it is a mistake to pick up a baby every time he cries, it is necessary to exclude sources of discomfort, such as hunger, a wet napkin, colic, constipation, and pain. Apart from these, the child may quite easily get into the habit of crying, or the baby, even the very young baby, may realise that he can readily attract attention by a display of tears or temper and thus be spoilt. It is advisable to seek expert advice if the fits of crying persist without apparent cause.

CARE OF THE MOUTH, NOSE, AND EARS.

Common sense applies in the cleanliness of the mouth, nose, and ears, just as in all other matters relating to the care of the baby. The lining of the mouth is very delicate and easily scratched. It should not, therefore, be cleaned. Indeed, any attempt to clean the mouth may result in an infection which will result in difficulty in feeding and fretfulness. As mentioned earlier, the nostrils must be cleaned regularly, but this only means the entrance to the nostrils. Sneezing and discomfort are caused if the cotton wool is pushed up too far. The cotton wool swabs used to clean the nose should be moistened in warm water and twisted to a point. The ears may also be cleaned gently in the same manner as the nostrils, but no attempt to remove dirt or wax with a solid instrument, like a match-stick or hair-pin, must be made. Permanent injury to the ear-drum and hearing may easily result.

BREAST-FEEDING.

Every baby has the right to expect that his mother will feed him herself. That is the natural way and has advantages to both mother and baby. The baby gets the best possible food without any of the risks of contamination that may occur with the preparation of artificial food. The temperature of breast milk is that of the infant's body and it contains various protective substances which help to shield the baby from infection.

The mother, for her part, has the satisfaction of knowing that she is "mothering" her baby in the fullest sense. Incidentally, breast-feeding costs nothing, whereas artificial feeding can be quite an expensive matter. There are certain medical conditions where a mother should not feed her baby herself, but they are very few in number.

As in everything else in life confidence arises from the knowledge of the right way to do a thing. Breast-feeding is no exception to this rule, but it is particularly important that the mother should have full confidence in her ability to feed the baby, as any nervousness and anxiety on her part are soon transmitted to the child. This is one of the reasons why regular visits should be made during pregnancy to the doctor or clinic, in order that the mother's general health may be investigated and such important details as the care of the nipples attended to. The midwife will see that a regular routine is taught during the first fortnight of the baby's life, so that by the time the mother assumes full responsibility for the baby she will have had quite a lot of experience.

The general rules are, of course, quite simple. A regular routine is desirable both for the sake of mother and baby. The latter must be able to have his food at the same times each day, and the regular routine helps the mother to lead her normal life. The mother will already have had instruction on the care of the breasts, and in particular the preparation of the nipples so that they will not become tender when the baby starts feeding. The next essential is, of course, cleanliness. The nipples must be carefully washed before and after feeding and particular care should be taken in drying after feeding, as a little crack or fissure in the skin of the nipple, in addition to causing pain and discomfort, may let organisms enter to cause a breast abscess.

The third essential is to persevere. Many young mothers get discouraged at what proves to be in fact only a temporary upset. For example, the baby with a cold in the nose has difficulty in breathing and feeding at the same time, but a little patience will soon ensure that he does not suffer, by taking a little longer at each feed.

The last great requisite is calmness. Breast-feeding is a natural process, and countless millions of women have successfully fed their babies since the world began. It is not therefore a matter for nervous speculation and anticipation. Any nervousness or sense of strain on the part of the mother is quickly felt by the infant, who will in turn be restless and irritable. A comfortable position in quiet surroundings, and a regular routine, will ensure that the baby can give his entire attention to feeding, and the supply of milk almost invariably keeps pace with the demand. If any little anxiety or doubt arises in the mother's mind she should seek competent advice and not listen to "old wives' tales." The doctor, midwife, or health visitor, are the best people to advise.

WEANING.

No sensible grown-up person would contemplate changing suddenly from a normal diet to one entirely different. In the same way, weaning should be a gradual process. Between the sixth and twelfth month of life the baby will be changing from four-hourly feeds to the "three good meals a day" routine which he will hope to continue for the rest of his life. To begin with, therefore, it will be natural to change his diet by altering *one* of his feeds, for example that at 10 a.m. This may be at first one of the recognised proprietary milk foods, and later such items as milk pudding, potato and gravy, and green vegetables, may be given. From the sixth month onwards, the baby will want to nibble a rusk or hard-baked crust, which may be smeared with butter, egg, honey, etc. It is not necessary to continue breast-feeding beyond the ninth month and many mothers stop earlier. Much depends on the health and energy of the mother. Generally speaking she should try and continue breast-feeding during the hot weather and not wean until the autumn. By this means the anxiety of protecting the baby's food from contamination during the summer months is avoided. It is also inadvisable to wean if the baby is suffering from illness. It is much better to continue with breast-feeding until he is well. It

is sometimes necessary suddenly to wean a baby. For example, the illness of the mother may make this imperative. In that event expert advice should be taken, as the sudden transfer to an unsuitable food may upset the baby's digestion. Again, the amounts of food taken by different babies vary very much, and one may take several ounces more than another in the course of twenty-four hours. It may therefore be necessary to try different kinds and amounts of artificial food before the right one is found, and expert advice on this is most helpful.

ARTIFICIAL FEEDING.

It would be unwise in these notes to attempt to describe the various kinds of artificial food for a baby. Babies vary in their likes and dislikes from one to another just as grown up people do. The basis of artificial food is cow's milk modified in various ways. Very few infants will tolerate whole cow's milk as the amounts and nature of the fat, sugar, and protein, are different from human milk. Expert advice should be sought on the best type of artificial food for the baby, but there are certain fundamental rules which must be followed in all cases. In addition to the essentials already set out for breast-feeding, namely, a regular routine, quiet surroundings, and personal care all the time the baby is being fed, particular attention must he paid to cleanliness. It is very easy to contaminate the baby's food in the course of artificial feeding and infections caused in this way may prove to be serious.

First, the mother must make sure that her own hands are clean by scrubbing with soap and water and drying on a clean towel before each feed is prepared. This precaution is particularly necessary if the mother or one of the other members of the family has an intestinal upset, such as diarrhœa. Next, the room in which the food is prepared must be scrupulously clean and free from dust and dirt. The outside of tins and containers must be cleaned before they are opened and so must the table or tray on which the food is kept. Much time is saved by neat and methodical preparation. If everything required is kept always in the same place, and used articles are cleaned and replaced immediately, the risk of contamination by constant handling of unnecessary articles is thereby reduced. Saucepans and bowls and basins must also be absolutely clean, but the most frequent source of infection is in the feeding-bottles and teats. If these are not cleaned properly after each feed the film of milk left behind makes an ideal breeding-ground for bacteria. Feeding-bottles should be washed after each feed, rinsed, and kept in cold boiled water until required again. They should also be boiled for five or ten minutes every twenty-four hours. Teats should be turned inside out and cleaned thoroughly after each feed, and boiled once a day in water to which a little salt has been added: the salt helps to preserve the rubber. Between feeds they also should be kept in cold boiled water.

It is advisable to boil all milk for babies, especially in hot weather. Indeed, where there are no proper facilities for keeping fresh milk, it may be wiser to use dried milk in very hot weather. It is also essential to see that jugs and bottles containing milk are securely covered to keep out dust and flies.

The actual feeding of the infant should follow the same routine as for breast-feeding. The baby feeds best when he is quiet and comfortable, and the napkin should therefore be changed before feeding. In no circumstances must the baby be given a bottle and left to his own devices. The mother should stay during the whole feed and hold the bottle herself. Only by this means can the little encouragement and attention which mean so much to the health of the infant be given.

Vitamins

Milk, fruit, and vegetables make the basis of the baby's diet, but by the age of nine months he is able to digest tender and finely divided meat, and also fish. At this age all fruits can be eaten, but fruit with pips and skins, *e.g.*, black and red currants and gooseberries, require to be strained and given in the form of gooseberry fool, etc.

Similarly, all vegetables can be taken, provided that they are young and tender and well cooked, and small amounts of lettuce, carrot, and other salads can be given, provided that they are finely divided.

It is essential to ensure that the infant receives an adequate supply of vitamins, especially in the winter. This may be done by adding fresh or concentrated orange juice or rose-hip syrup, and cod-liver oil or halibut-liver oil, to the diet, or by means of vitamin concentrates. It is advisable to take expert advice on the most suitable way of supplementing the vitamin content of the diet especially following an infection, for coughs, colds, and other infections, tend rapidly to lower the reserves of vitamins in the body.

Foods containing iron include green vegetables, and bone and vegetable broths. Calcium, so important for bone formation, is supplied with the milk in the diet.

THE SYMPTOMS AND SIGNS OF ILL-HEALTH.

It is, of course, essential to seek advice immediately illness is suspected. The signs and symptoms of illness in the baby are not so clearly defined as in grown-ups, nor can the baby tell where he has pain or discomfort. Again, anxiety or doubt in the mother's mind is best shared with an expert as soon as possible. The following notes may, however, serve as a guide in interpreting some early departures from the normal.

Temperature. A young child will often develop a rise of temperature for no apparent reason, as the mechanism for controlling the heat of the body is not so well regulated as in older people. A slight temporary rise in temperature may not therefore be so significant as in older children, but if at the same time the child is restless, irritable and "off his food," it should not be neglected. The thermometer should be placed under the armpit with the arm held closely to the side, or in the fold of the groin with the legs held closely together. As the skin temperature is a little lower than the body temperature it should be kept in position for five minutes before reading the result. The normal temperature is 98·4° F.

General Appearance. The mother will be able to tell when a child is ailing, as she sees the baby constantly. Restlessness, irritability, pallor or undue flush, sweating, crying and unusual movements or positions, may all give an indication that the child is unwell. Colic, or vomiting and diarrhœa or constipation, may also help to show abnormalities.

Restlessness and disturbed sleep in a baby who had previously been sleeping and eating well are obviously indications that there is something not quite right. This is especially the case if at the same time there are other symptoms, such as sweating and a rise in temperature. Lying in an abnormal position, or the development of rigidity in the back or neck, should be enough to seek expert advice at once.

The Air Passages. The common cold may be quite a serious matter in the young baby. In addition to making him feverish and fretful it interferes with his feeding because the nose is stuffed up. A cold in the head should not be treated lightly and every effort should be made to keep away people who have a cold so that the baby does not catch it. When nursing a child with a simple cold make sure that he has plenty of fresh air. A stuffy atmosphere delays recovery, and the child will come to no harm if he is warmly clad. Patience in feeding is required, as he will need frequent rests to get his breath. Plenty of warm, sweetened, boiled water will help to relieve thirst. The nostrils should be kept clean and soreness prevented by lightly rubbing vaseline round the nose and upper lip.

Cough and Shortness of Breath. If the baby develops cough, and shortness of breath, expert advice should be sought at once. There is, of course no need to assume that the child has some serious condition such as pneumonia. Probably he has some simple condition which will get better in a few days with expert treatment. On the other hand, it would be sheer stupidity not to take advice, as even a simple bronchitis can cause the baby distress and interfere considerably with his feeding.

Refusal of Food. A young child refuses food either because he does not want it, or he is "full up," or because he is not feeling well, or because he is feeling cantankerous and is "playing up" in consequence. The first and last reasons are soon

cured by hunger, but the onset of illness, and especially the early stages of infection, are not easy to detect, and it is inadvisable to delay too long before seeking advice.

Vomiting and Diarrhœa occurring together should lead the mother to seek advice at once, particularly if this happens during the hot weather and other cases are known to have occurred in the neighbourhood.

Vomiting without Diarrhœa. It is normal for the child to regurgitate a little food after feeding particularly if he has had too much. Again he may bring up a little milk with the wind, but the vomiting of sour curdled milk is not a normal event. Persistent vomiting, particularly if "explosive," or not related to food, will need expert advice, as it may be the first symptom of illness.

Diarrhœa. Slight changes from the normal, righting themselves in a few hours, are only to be expected from time to time. If diarrhœa persists, and particularly if the child is also out of sorts, expert advice must be taken. A change of colour of the motions from orange-yellow to a green slimy stool is an indication for seeking advice at once. In any attack of diarrhœa, however slight, particular attention should be paid to the skin of the buttocks, as this readily becomes inflamed and sore. The treatment for sore buttocks is described earlier in this article.

Constipation is not a cause for anxiety unless it is persistent, or the child is ill in other respects. In fact many babies tend to be constipated. Drastic measures are not called for. It is, of course, essential to persevere with the regular routine each day in order that regular habits may be acquired. The first essential in treatment is to see that the baby is getting enough food, and adequate exercise, together with plenty of sweetened water, or fruit juice and water to drink. Constipation is more frequent in the older infant who is taking mixed or artificial food, and he can be given such simple (and usually effective) remedies as a teaspoonful of prune juice or a teaspoonful of honey in warm water. Persistent constipation requires expert advice, and remedies such as glycerin suppositories or enemas should not be given without that advice.

Feeding Troubles. In addition to the above indications of ill-health there are other signs and symptoms which help to show when the baby is not feeding properly. Distention and discomfort may be indications that all is not normal. Some distention after a feed is not abnormal, but it should subside before the next feed. Persistent distention, especially if it is increasing, should lead the mother to seek expert advice.

Discomfort after feeding is not normal. It may vary from mild restlessness and fretfulness to attacks of colic with screaming and the legs drawn up. Examination of the motions may show that they are loose and green or contain white undigested lumps, in which case expert advice should be sought.

Failure to Gain Weight and Wasting. It is essential to remember that babies are not machine made. Therefore they vary from one to another. One may be big and sturdy with a loud cry and a lusty appetite. Another may be small and quiet with only slow gain in weight. Too much attention must not be paid, therefore, to the weighing machine. If the baby is placid, healthy, and sleeping well, the fact that he is not gaining rapidly in weight does not matter. If, on the other hand, the child looks tired and thin with sunken eyes and the fontanelle on top of the head drawn in, expert advice must be sought. If he also has diarrhœa and is irritable or apathetic, then expert advice should be sought immediately.

Teething. There is no doubt that teething causes temporary disturbances in most babies, but it is important that illness due to other causes should not be dismissed as teething trouble. It is safer, therefore, to assume that any illness is not due to teething and to seek advice. The kinds of disturbance that may occur in teething are local and general. The local symptoms are pain in the mouth with sore and inflamed gums. The child resents any attempt to see the teeth. There may also be dribbling, and enlargement of the glands in the neck. The general symptoms may include a tendency to eczema, and bronchitis, and nervous symptoms, such as fretfulness, irritability, sleeplessness and convulsions. Expert advice should be sought for such conditions as eczema, bronchitis or convulsions. Beyond this no treatment is required except patience and watchful care. Common sense will show the wisdom of studying the child's needs for soft and easily digested food, and avoiding hard crusts and rusks until the tooth is through.

Convulsions. The occurrence of convulsions is a danger signal indicating the need for immediate medical advice. In many instances the cause and the remedy are simple, such as faulty feeding with insufficient vitamins in the diet. On the other hand, they may be an indication of the onset of an acute infection, or some other condition requiring careful investigation. Fortunately convulsions are rarely fatal, and the first-aid treatment is to put the baby in his cot in a quiet corner of the room and send at once for the doctor.

Head Injuries. Babies and young children can fall in the most alarming manner without sustaining anything more serious than a bruise. If, however, following a head injury, the baby is pale and drowsy with vomiting, then expert advice must be sought immediately.

PREVENTION OF ACCIDENTS

Each year about 6,000 people die, in England and Wales alone, as the result of accidents in the home. More than one-quarter of these are children under the age of fifteen, and between the ages of one and five years a fatal accident in the home is the third most frequent cause of death. Many of these are either due to accidental suffocation or to burns and scalds.

Down pillows for small babies were formerly a common cause of suffocation. Burns and scalds may result from an unguarded fire, or one in which the fire-guard is faulty. Electric flex with worn insulation is a particular danger to the toddler, for he may fall over it, or get an electric shock if he plays with it. A saucepan handle put within easy reach of the child, or an over-hanging table-cloth with a tea-pot on the edge of the table, may result in a bad scald if the child can reach to pull it down.

Medicines or garden chemicals, etc., left lying about may tempt the child to eat them, and in this connection it should be remembered that young children are more susceptible to poisons than adults.

Finally, a very young child, like an old person, falls readily, and care should be taken not to put obstacles in its path, such as a loose mat on a slippery floor, or a worn carpet with loose strands.

The young baby should be so well protected that accidents do not happen, but they do sometimes occur, even in the best regulated families! The first essential is, of course, prevention, and the wise parent will look carefully round the rooms in which the baby lives to see that all fires are protected by guards, electric light and power flexes and switches are not exposed, and that hot kettles and taps are out of reach. The table must be so laid that sharp knives cannot be touched and table-cloths cannot be pulled, and tea-pots, and other vessels containing hot liquids, thereby spilled over the infant. *See also* S38.

Protection against Smallpox, Diphtheria, Whooping Cough, and Poliomyelitis.

Smallpox is now rare in the British Isles because of the care taken at the sea and airports to keep it out of the country, and because vaccination prevents it from spreading if it is introduced. It is a very serious disease with a high mortality, particularly in young children.

Although compulsory vaccination has been abolished it is still essential that every baby should be vaccinated. This can be done either by the family doctor or at the Welfare Centre.

Diphtheria, Whooping Cough, and Poliomyelitis. During the late war the diphtheria immunisation campaign was so successful that the number of cases and the deaths from diphtheria were reduced beyond all expectation. Diphtheria remains, however, a very serious disease and the baby must be protected against it. Immunisation is a simple procedure and does not leave any after-effects. It can be done by the family doctor or at the Welfare Centre. It is now possible to immunise also against whooping cough, and poliomyelitis, and it is a wise precaution to take medical advice on protection against these serious diseases.

MATERNAL AND CHILD CARE IN THE SO-CALLED BACKWARD AREAS OF THE WORLD.

People living in wealthy countries, with highly developed medical services, soon come to take those services for granted. In many parts of the world, and particularly in tropical and sub-tropical regions, the combination of poverty, the great killing diseases such as malaria, and malnutrition, make the problems of care of mothers and children peculiarly difficult to solve.

Fresh milk and feeding-bottles for infants may be unknown, and the scarcity or pollution of water supplies may render the preparation of infant food a hazardous undertaking. The simple nature of the houses renders elaborate provision impossible and there may not be storage space for food. There is often a shortage of fuel, and few cooking-utensils are available. In many areas the food for the infant is prepared in the same pot and at the same time as that of the adults. The result is that breast-feeding is prolonged, often for two years or more, with a sudden change to the diet of adults. As this may consist largely of carbohydrates, and because first-class proteins in the shape of meat and fish are only rarely available, children tend to be kept on starchy food. They are thus deprived of the balanced diet of fats, carbohydrates, and proteins, and of the essential vitamins which are required for healthy development. As their mothers may also be undernourished, they start life with a double handicap. The result is then only too clearly seen, in the form of anæmia due to deficiency of iron, and various conditions due to lack of proteins and vitamins. Avitaminosis, as it is called, may take a number of forms, including the onset of blindness or rickets. Indeed, rickets is now more common in such countries as India, tropical Africa, the Middle East, and some areas in South America than it is in temperate climates, in spite of the adequate amount of sunshine.

A condition which is receiving much attention at the present time is the disease known as kwashiorkor, due to deficiency of first-class protein, and seen in many tropical and sub-tropical countries. The child victims of this disease not only fail to grow but also show marked mental changes, manifested by lack of interest in their surroundings and a general appearance of misery. Other symptoms include widespread skin lesions, changes in the colour of the hair, loss of appetite, and vomiting. In more extreme cases the infant may display the wizened, shrunken appearance of extreme starvation, a condition then known as marasmus.

It will readily be appreciated that such infants are particularly susceptible to infections of all kinds, in addition to those peculiar to the region in which they may live. Besides the common infectious diseases of childhood, these undernourished children are at risk from tuberculosis, malaria, yaws, worm infestations, and dysentery. It is not surprising, therefore, that as many as 40 per cent. of children born in such areas may fail to survive the early years of life. Poverty, a low standard of health, and a general shortage of medical and nursing services, combine to produce high infant and maternal death-rates, and these are usually associated with high birth-rates.

It is clear that any programme for the protection of maternal and child health in the so-called backward countries must be based on adequate knowledge of the area concerned, including its climate and culture, the standard of health of the population, the economic circumstances of the country, the level of education, and the efficiency of the government organisations.

After the Second World War two international agencies were established which have a special interest in maternal and child care. They are the United Nations Childrens' Fund (UNICEF), and the World Health Organisation (WHO). *See below and also* C18.

WORLD HEALTH.

The study of world health is a very recent development, made possible only by the establishment of the great international organisations, such as the United Nations and the World Health Organisation. One of the functions of these bodies is the collection and comparison of statistics from many countries, and, although much of this information is as yet incomplete, it has, within the last few years, become possible to form a rough estimate of the population of the world, its rate of growth, and its state of health. Thus, in 1957, the population of the world was estimated to be 2,795 million people, of whom over half lived in Asia, 15 per cent. in Europe, 9 per cent. in North America, 8 per cent. in Africa, 7 per cent. in the U.S.S.R., 5 per cent. in South America, and less than 1 per cent. in Oceania (*United Nations Demographic Yearbook* 1958). The average birth-rate was 34 per 1,000 population and the death-rate 18 per 1,000, with an annual growth rate of population of 1·6 per cent.

Although these statistics are most valuable in predicting broad population trends, and for estimating the food requirements of the world in future, they are by no means a true picture for various parts of the world. Further scrutiny of the statistics reveals, for example, that in Northern and Western Europe the birth-rate is only 18 per 1,000 and the death-rate 11 per 1,000, with a population growth of 0·6 per cent. In South-West Asia, on the other hand, the birth-rate is 42 and the death-rate 18, with a population growth of 2·4 per cent. In Tropical and Southern Africa the birth-rate is very high, at 45 per 1,000 population, but death-rates are also high, at 26, so that the rate of population growth is only 1·8 per cent.

Clearly, then, health conditions vary widely in different parts of the world, and this is emphasised by the fact that while the average expectation of life at birth in some countries is seventy or more years, in others it remains at about thirty. That is due principally to the fact that the great killing diseases of infancy, childhood, and early adult life have been brought under control in some communities but are not yet under control elsewhere.

We live, in effect, in two worlds. In the smaller, composed of countries like those of Western Europe, North America, Australia, and New Zealand, the population is composed of relatively few but healthy children, many healthy adults, and an increasing number of old people. The principal causes of death are those of later life, such as heart disease and cancer. In the much larger part of the world the killing diseases of infancy and childhood, the great acute infective diseases such as smallpox, typhoid fever, dysentery, and pneumonia, and the chronic infectious diseases illustrated by tuberculosis, malaria, and syphilis, still take a heavy toll of human life, especially in the early years. These diseases are also the cause of much human misery and suffering, especially when they are associated, as is so often the case, with severe malnutrition, with resulting deficiencies of vitamins and first-class proteins.

Twelve years ago, on April 7th, 1948, the World Health Organisation came into being. In the preamble to its Constitution health is defined as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity." Article I stated that "the objective of the World Health Organisation shall be the attainment by all peoples of the highest possible level of health."

During the past twelve years the World Health Organisation has striven to attain this end, in association with other international agencies such as UNICEF (The United Nations Children's Fund), in a variety of ways. Through its head-

quarters in Geneva, and the Regional Offices for Africa, the Americas, Europe, the Eastern Mediterranean, South-East Asia, and the Western Pacific, attacks on a massive scale have been made on the great killing diseases of the world. Malaria, tuberculosis, the venereal diseases, and other infections have been met with the most modern methods of prevention and treatment. At the same time the education and training of skilled medical, nursing, and ancillary staffs have been undertaken, together with the improvement of nutrition, environmental sanitation, and the organisation of health services.

Although the amount of money available for all this work work is limited, much progress has been made. By its Constitution WHO is restricted to assisting Governments on request, but there are very few countries which are not now in active association with the work of the Organisation, and it is truly world-wide. Definite improvements are already apparent. In some countries the control of one disease, malaria, has caused the death-rates to fall to one-half of their former numbers. In many countries, also, the expectation of life from birth has risen so rapidly as the result of the control of disease that it is now forty-five years or more as compared with thirty years or less until quite recently. A very great deal remains to be done, but already it is possible to foresee the time when it could be one world again from the point of view of the control of disease and the maintenance of health.

Unfortunately, it is not just a simple matter of preventing and curing disease. The success achieved so far has already revealed further problems. Many more people are now surviving to adult life, more babies are being born into the world, and they in turn are being aided to survive the great killing diseases of infancy and childhood. As noted earlier in this article, world population is now increasing at the rate of 1·6 per cent. each year, and the most urgent problem is to ensure that sufficient food is produced for these increased numbers to survive and live full and useful lives. There is no point in preventing death from disease merely to die later of starvation, or to live in a state of chronic malnutrition. All Governments are now aware of this danger, and it is fortunate that modern methods of agriculture enable more intensive cultivation of existing land to be undertaken, and that additional land is continually being brought into use.

The first advances towards health were made by attacking the physical environment. Attention was paid to the purity of water supplies, the disposal of waste products, contamination of food, better housing conditions, and the prevention of industrial injuries and poisoning. Atmospheric pollution was also found to be an important cause of disease. While these improvements were being made the growth of scientific knowledge made it clear that man was also at risk from other living organisms, especially bacteria, viruses, and various parasites, and so began the attack on the biological environment, in the effort to control the diseases caused by these organisms and to prevent their transmission from one person to another. The most recent development has been the realisation that many conditions favouring ill-health are made by man himself. That is particularly true of mental stress and anxiety, and much attention is now being paid to the subject of mental health. The social environment has only received detailed consideration in the present century, but much is now being done to instruct and advise people to be more enlightened in their dealings with others.

The individual, the family, the local community, and the State each have their parts to play in the promotion of health. We are, indeed, only at the beginning of our struggles to conquer disease and promote health throughout the world, but a most promising start has been made.

WORLD MENTAL HEALTH.

In ancient times, as in many parts of the world today, the strange behaviour and unpredictable reactions of the mentally ill were regarded with fear, as a visitation by some supernatural force or "possession" by a spirit. Indeed, in many primitive societies some form of seizure or fit, of a hysterical nature, is still the socially accepted reaction to a personal disaster, or emotional crisis, to be cured only by the exorcisms of the priest or witch-doctor.

The treatment of the mentally afflicted in such primitive societies was often violent and cruel, but, on the other hand, the closely knit ties of family provided for community care in the best sense of the term, just as the simpleton was kindly treated by the other inhabitants of the village in mediaeval Europe.

As civilisation became more complex, particularly in Western Europe, the lot of the mentally afflicted became harder. Segregation in institutions, such as Bedlam (originally Bethlehem) in London, confinement in chains, whippings, and beatings, and even public exposure like wild animals in a zoo, were the usual fate of the insane poor, while the wealthy were imprisoned in a locked and barred room with a keeper. So heavy was the stigma of insanity that its presence within a family was concealed, as is the case in some Eastern countries today.

This grim picture began to change in Western countries about one hundred and fifty years ago when Philip Pinel in Paris first struck the chains off the lunatics under his care and the Quakers founded The Retreat at York in England. But, although physical cruelty became unfashionable, society still required the insane to be confined in asylums, usually for life, and this imprisonment was not accompanied by any form of investigation or treatment worthy of the name. It did, however, provide opportunities for the study of mental disease, and gradually certain broad patterns of mental disorder became apparent. It was recognised, for example, that one form, known as mental deficiency, was due to an incomplete or arrested development of the mind, either because of some defect of development or as a result of some injury or disease in the formative years of life. It also became clear that certain forms of mental illness appearing in those whose minds had already developed fully were, in essence, extreme manifestations of the normal emotional responses. The violent alternations of excitement and depression which characterise the manic-depressive, the despair of the melancholic, and the withdrawal from the outside world of the schizophrenic, to give only some examples, are all pathological manifestations of reactions which, in moderation, might be regarded as normal for an individual of a given temperament. Thus many apparently obscure mental conditions were found to be capable of rational explanation, and the way was opened to more enlightened methods of care and, indeed, prevention.

With the extension of these studies to the backward areas of the world it is becoming recognised that similar departures from the normal may be found in all races. It has been found that the tribal African, for example, will reveal certain broad patterns of abnormal mental behaviour which are similar to those of his more sophisticated counterpart in the West, but, by reason of his upbringing and environment, the detailed nature of his disorder may be very different.

Although the nature of man's mental reactions may be determined at the moment of conception, it is his external environment, particularly in infancy and childhood, which determines his subsequent development, mental as well as physical. Thus a person of excitable temperament, easily roused to anger or moved to tears, may by early training in a suitable environment learn discipline and self-control, so that these endowments become assets and not hindrances. If the early environment is not favourable, or if he is transplanted to

unfavourable surroundings, such a person may become at best unstable or, at worst, show signs of gross mental disorder. When a member of one culture is suddenly transferred to another the reactions may be equally unpleasant. The African in a European city may respond to stress by violence, while the European can deteriorate rapidly in the loneliness of a tropical environment unless he is by nature calm and placid, with adequate reserves of self-control.

It is against this background that the world picture of mental health must be assessed. Basically it may be said to be one world, in that all men are born with certain common patterns of behaviour, just as they share a given number of blood groups, and similar anatomical and physiological development. From a very early age, however, even before birth, the effects of differences in environment become evident. Malnutrition and disease in the mother, poverty, and even the place of birth, may be decisive in determining the future mental development of the individual, quite apart from the nature of the family into which he is born and the society in which he matures.

Hence it ceases to be one world and becomes two, for the people of the Western countries have so modified their environment that they have succeeded in adding many years to their average expectation of life. A man in such a country may expect to live for seventy years and a woman for several years longer than this, whereas in an under-developed country the expectation of life, especially for a woman, may not exceed thirty years. Those who live in the vast rural areas of the world are at the mercy of the elements, whereas Western peoples have become dependant on the machine, and the speed of existence is governed largely by this. In the former, endurance, amounting almost to fatalism, is an essential requirement for survival, whereas in the latter speed and precision are required, sometimes with a margin only of seconds between success and disaster. These factors produce different manifestations of mental stress in the two types of society.

In highly industrialised communities the problem child, the problem family, and juvenile delinquency, for example, flourish in the overcrowded and congested areas of large cities, especially those parts which are falling into decay. The long time-lag between sexual development at puberty and full social maturity, which may occur ten or even twelve years later at the end of university education, also imposes heavy strains on the young which are not felt in the under-developed countries where early marriage and unrestricted child birth are customary. The adult in urban society has also many responsibilities in addition to the stress and fatigue of his work and the journeys to it. Failure to achieve promotion, or inability to hold down a more senior post, may produce unfavourable reactions in the individual concerned and in many of those in contact with him, both at his place of work and in his home. Finally, the mere extension of the expectation of life brings problems unknown to the short-lived communities in other parts of the world. The depressive states associated with the sexual changes of later middle life, and the slow mental and physical deterioration of the aged, are exaggerated by the restrictions and loneliness of urban life. But it is, above all, in the loosening of spiritual and family ties that the greatest differences between the two worlds may be seen. In spite of its many hardships, poverty, and disease, the pattern of life in the "backward" rural communities provides a continuity, and a sense of permanence and security, which is lacking in industrialised societies.

It might be said, therefore, that the inhabitants of these two worlds have drifted so far apart that their problems in the field of mental health are no longer comparable, but that is not true. The poorer countries, aided by the more wealthy, are now in a state of ferment. Great industrial cities are developing, and the rural workers are finding that their ancient way of life, hitherto unchanged for thousands of years, is becoming the subject of intensive study, so that all aspects of it, even the number of children they should have, are being questioned. With the control of the great killing diseases the expectation of life is rising rapidly, the pressure of population is increasing, and the problems of mental health, hitherto obscured by more important aspects of a brief and hard life, are becoming important in those countries also.

Thus it is not irrelevant to speak of world mental health, and indeed the World Health Organisation chose the theme "Mental Illness and Mental Health in the World of Today" for World Health Day in 1959. What, then, are the requirements? First and foremost is the need for accurate and acceptable definitions of mental disease. Unlike tuberculosis of the lungs, for example, mental disorder may manifest itself in a great variety of ways, but with the growth of modern knowledge certain broad categories are merging, such as a state of subnormality so severe that the person concerned is incapable of guarding himself against common dangers, or of being taught to do so, as compared with mere backwardness requiring special education or training in a sheltered environment. Among those whose minds have developed fully it is possible to recognise those who are so ill that they require the same kind of care in hospital that is given to the great crippling diseases of the body. Between these extremes are a large and ill-defined section of people who are not mentally defective, nor do they suffer from one of the gross psychoses, but they are mentally unwell for shorter or longer periods of time, and often the illness is a recurrent one. Included here, for example, would be those suffering from some psychopathic disability, in which the disorder of mind renders the victim irresponsible, anti-social, or aggressive, so that he does not fit readily into the pattern of society. The precise definition of these various groups is, of course, a matter for the experts, and psychiatrists are now reaching a degree of unanimity which would not have been possible a few years ago. The study of mental illness will become as exact as that of bodily illness, although there is still a long way to go in this respect.

The next requirement is for accurate statistical information. Western countries have come to take for granted the reliability of medical certificates, but in some parts of the world as many as 70 per cent of the people may live and die without any medical care, other than that provided by the untrained village practitioner. In such communities, where even the reported cause of death may be limited to "cough" or "fever," accurate statistics of mental illness are quite impossible to obtain. All that can be done at present is to draw certain broad inferences and check these by surveys conducted by trained research workers.

Fortunately the basic requirements for promoting and maintaining mental health are sufficiently well known, and they are capable of application throughout the world. Thus, it is generally accepted that a happy home life in infancy and childhood, with devoted parents, is, in itself, the greatest safeguard, especially if the individual concerned remains within the society in which he was reared. If he is removed to an alien environment he may break down, but even then his early training will usually enable him to survive, particularly if it is reinforced by some spiritual sheet-anchor. In this respect the village community, with its tradition of mutual help, has great advantages over the impersonal nature of the cities, where loneliness plays an important part in precipitating mental illness.

These problems are now capable of free discussion, and the recognition that each individual can only reach optimum development in favourable surroundings will go far to prevent the misfits of the past. Indeed, the main task today is so to improve the physical and social environment that every child may have an opportunity to attain full physical and mental maturity according to his capabilities.

Family Affairs

TABLE OF CONTENTS

Family Affairs

INTRODUCTION.

THIS section has been written with an entirely practical purpose: for it is going to deal with the problem of how you or I, the man, or woman, in the street can be happy and make the most of our opportunities in this exciting, fascinating, but often perplexing and terrifying world in which we live.

Of course, it would be impossible to deal with every special human problem in the space available here. Nor is it desirable to do so; for most problems cannot be solved merely by reading about them. The section attempts to do two things: first, to give understanding (which is the first step in solving any problem) and, second, to suggest where you may go for more personal and detailed advice.

There are also suggestions in this Family Affairs section for those who are thinking of buying a house; and there is a guide on the whole field of insurance, both on life and property. It would indeed be a tragedy if you should be needlessly worried or unhappy when there are so many people willing to help. Let us see what can be done!

I. HUMAN RELATIONS

By a Doctor

In most countries scientific knowledge has made possible greater material well-being, better education, improved health, and a higher standard of living for the ordinary man and woman, yet it is doubtful whether our capacity for happiness and peace of mind has correspondingly increased. There is an old saying, "happiness is with people," which means that satisfaction in living springs from good relationship with our fellows. This is something which wealth, health, and good education cannot guarantee, no matter how important these things are in themselves.

CAUSES OF UNHAPPINESS.

If you were a doctor, a social worker, or a psychologist, you would soon find that there are three immediate causes of unhappiness: ignorance, environmental problems, and psychological problems. Most unhappy people are suffering from a mixture of all three.

By *ignorance* I mean that many people are discontented or troubled either because they do not know where to turn for help when it is needed or because they have got into difficulties through not knowing the rules of living.

By *environmental problems* I mean not getting on with the people one has to associate with, being in a job which one finds unsatisfying and all the other everyday situations which arise from clashes between the individual and his surroundings.

Psychological problems are difficult to define; but, generally speaking, I shall speak of "environmental problems" when I mean that the trouble lies mainly in the person's surroundings and circumstances, and of "psychological problems" when I mean that the trouble lies mainly within the individual himself. If, for example, a man is unhappy in a particular job, leaves it, and later finds a job in which he is quite satisfied, we should suppose that it was originally a case of "right man, wrong job"; but if he goes from one job to another, never finding the "right" one, then there is surely something wrong with the man. Similarly, it is quite possible for a girl to meet the wrong man once, or even twice, but if all her attachments end unhappily, it is likely there is something wrong within herself.

THE MEANING OF HAPPINESS.

Pleasure and Happiness.—Many people confuse two quite different things—pleasure and happiness. *Pleasure* is always temporary and usually physical in origin, and is associated with those things which one usually (depending, of course, upon one's tastes) considers "fun" to do: having a good meal, making love, lying in the sun, listening to music. You will notice that all these things have this in common: (1) they all come through the senses of sight, feeling, hearing, and tasting or smelling; (2) they are always temporary; (3) they are all "pleasant" in the sense that they are, quite simply, enjoyable in the most obvious way. But *happiness* is something quite different; for while it is true that all people enjoying pleasure are, for the time being, happy, the reverse is not true. One can be happy when quite unpleasant things are happening. "Happiness," said a famous psychologist, "is a state of going somewhere." It is no coincidence that the suicide rate always drops in war-time; for war, in spite of all its horrors, supplies the three emotional needs felt by all normal people—the need to be appreciated—to "belong" as the Americans say; the need to be useful; the need to have an aim in life. There is a dramatic relationship between human misery and loneliness or lack of an aim in life.

Conclusions.—In order to be happy one needs a goal to strive for, the love of a few, and the respect of those who share our views. The opinions of others need not matter. Therefore one is unhappy:—

(1) If one has no goal.

(2) If one is prevented by circumstances from attaining reasonable goals.

(3) If one has chosen unreasonable goals which cannot be attained.

(4) If one is compelled by circumstances to mix with the kind of people one finds uncongenial.

(5) If one is prevented by one's own personal defects (shyness for example) from mixing with those who are congenial.

There may be three causes of all these five: ignorance, environmental maladjustment, and psychological maladjustment, as has been explained above. The second and fourth, for example, are likely to be due to environment, the other three are more likely to be psychological in origin.

EVERY PERSONAL PROBLEM IS ALSO A SOCIAL PROBLEM.

This means that most of our problems, no matter how personal they may seem, are connected

with the type of society in which we live. How to bring up children, what to do with old people, whether a married woman should go to work or stay at home, problems of loneliness, of the unmarried woman, of sex, and even of religion, are problems of people living in a particular society at a particular time and place. If you are living in present-day Britain, some of these matters are bound to affect you. But if you are living as a small farmer in the South of France or Italy or Greece—or even in the West of Ireland or the North of Scotland—they may hardly have begun to affect you at all. In Central Africa, parts of Asia, or of South America, you could not even conceive of them. Why should this be so?

Peasant Communities.—First of all, those areas—rural France, Britain, Italy, Greece, and much of Asia, Africa, and South America—which we choose to think of as relatively "backward," are, in fact, leading the sort of life which was the rule almost the whole world over prior to about 1750. That is to say, they are areas where people make a living on the land, dwell in villages or small towns, and are guided in their conduct by tradition. Peasants living this sort of life have large families, and you would probably find numerous children, the parents, and the grandparents living under the one roof. There are no financial problems relating to children and grandparents, because both are economic assets: from a very early age the children can work with their parents in the fields, and the grandparents stay at home and look after the very young ones. Nor do problems of how to bring up children arise, because tradition ensures that all children are brought up (rightly or wrongly) in the same way. For the same reason, there are few difficulties about sex or religion or moral conduct generally; most people have the same religion (in Southern Europe, the Roman Catholic Church) and the same rules are accepted by everyone. Women work in the fields or at home, and no question of the type—career or family?—can arise, because the choice does not even exist. Nor is it possible to be lonely in such circumstances—in the village or small town everyone is acquainted with everyone else, and whether their feelings are of liking, disliking, or indifference towards any one person, at least they are never unknown to each other. In peasant society there is little room for romantic love, and the plain woman has just as good a chance of marrying as the good-looking one. There is no need to struggle against one's fellow-men, because few people move up, or down, the social scale, and what one is born, one remains. Man's main fight is against Nature, against disease, hunger, and the weather.

THE PROBLEMS OF MODERN LIFE.

(1) **The City.**—But in time we find ourselves living in a different community—a community in which there are big towns where most of us work in shops or factories. Even if we still work on the land, it is more often for somebody else than on our own small cabbage patch—for agriculture, too, has become industrialised. In this new sort of community life is different. Children cannot work until they leave school, so for fifteen years they are an economic liability—every doctor knows all too well the mother-to-be who tells him: "But, doctor, I can't afford another." Old people also become a liability because they find it difficult to get work in industry.

The functions of the family are increasingly taken over by the State. Children under school age go to kindergarten whilst their mothers go out to work; family squabbles are more often dealt with by social workers than by the parson; medicine is socialised, with many good results and some not so good; there is hardly any aspect of family life which does not have some external body to deal with it. In themselves, these changes are neither "right" nor "wrong"; we have to find out how best to use them, not how to turn the clock back.

(2) **Mass Communications.**—Other important changes have been due to mass methods of communication—to the popular magazines, radio, and television. Two main results have followed from these. The first is that, although we learn more, we understand less. Our minds, instead of being filled with one self-consistent belief, which, whether right or wrong, did make some sense about morals and the nature of things, are now filled with all sorts of garbled theories which, no matter how true some may be, collectively mean little to the ordinary individual. Thus, practically speaking, in the field of medicine (or any other field) we must either know a good deal or nothing at all; formerly, in our ignorance, we simply trusted our family doctor. Now we are in doubt and ask him whether he hasn't read of the new treatment in the *Daily Blank* or *Everyman's Digest*. Yet as G. K. Chesterton used to say, when one form of superstition is got rid of, it is replaced, not by reason, but by other superstitions which are not necessarily going to make us happier. Thomas Hood in his poem "I remember, I remember," tells how, as a child, he used to think that the sky rested on the tops of the tall fir-trees at the foot of his garden. Being older, he can no longer believe that this is so, and he adds:

> "It was a childish ignorance,
> But now 'tis little joy
> To know I'm farther off from Heaven
> Than when I was a boy."

I do not suggest that we must make ourselves believe what we find incredible, but I do suggest that when we seek opinions we should go to those we can trust *and then believe what they tell us*.

The second result of mass methods of communication has been the influence of advertising, which sometimes makes us regard as necessities things which are not necessary at all. We become more competitive and spend our time trying to "keep up with the Joneses"—they have a washing-machine (or a television or a car), so why shouldn't we? There is a perfectly harmless side to this too, but, as a famous psychologist has said: "It is much easier to create wants than to supply the means of satisfying them. To widen the gap between what people want and what they actually have or can reasonably expect to have is to make for widespread discontent and nervousness." We are always hearing that people are "frustrated," but it is important to remember that they are frustrated in terms of what they *think* they should have (and don't) rather than in terms of what they actually need. "Expectation minus realisation equals neurosis"; so the Arab chieftain with fifteen Cadillacs who wants sixteen is just as frustrated as his poorest subject who has no bread for tomorrow.

(3) **The New Position of Women in Modern Life.**—Two world wars have accustomed women to taking their place in industry, and once they acquired the taste they were less easily satisfied with life at home. This is the fundamental cause of woman's new attitude to work and family. But there are other causes which maintain the situation. One we have already mentioned is "keeping up with the Joneses"; for when people have raised their standard of living they are reluctant to reduce it, and obviously another breadwinner in the family raises its standard of living. Another reason is quite simply the social one. Many single girls work in a factory and, for the time being, the one important thing in their lives is to get married. But when they are married they dislike being left alone, as they often are, in a small flat, and return to work in order to be back with their friends.

Economically, women are less dependent on their husbands, so if things are not going well at home they see divorce as the obvious solution. It is this, rather than an increase in "immorality," which has caused the number of divorces to go up. (Incidentally, anyone who thinks that people are more "immoral" than they used to be must know very little about social history—even in the most conventional sense everyday behaviour is more moral than at any previous time.) But when many women are working, a new problem is bound to arise, the problem of career or family. The new situation means that the married woman in her less happy moments is likely to look back

and say: "What might I not have been if I had continued in business?" Whereas the unmarried business woman may wonder: "How happy might I have been had I been married with a family?"

(4) **Loneliness in Modern Life.**—In the large city there are more lonely people than in simpler societies, and there are a number of reasons for this. (Although it must be added that some areas of large cities are more liable to have this problem than others—for example, in the East End of London there is a greater sense of community life than, say, in the well-to-do suburbs.) One obvious reason for the increase in loneliness is simply that, whereas in the small village everybody knows everybody else, their virtues and vices—especially the latter—in the large town there are too many people and one does not feel confident in meeting others precisely because they are unknown. Then, whereas only about fifty years ago there were millions of people who had never been farther from their homes than twenty miles or so, today there is a great deal of shifting about. Students come to the big city to study, or workers to get jobs, and all of them are anonymous to each other. Many are afraid or suspicious of each other just because of this, and quite literally they wonder whether those they meet in restaurants or who live in the room next-door may be in one way or another undesirable. So the individual who is shy or unsure keeps clear of strangers no matter how lonely he may be.

For example, only a short time ago in one of the "better" suburbs of London a man fell down in the street. It was snowing, and many people were passing by, but none of them went near him. (They were, presumably, quite ordinary citizens, and one can imagine that they supposed the man to be drunk or that he had been involved in a brawl—in any case, they only wanted to avoid trouble.) In the morning the man was dead. He had had a heart-attack, and his life would have been saved if a single passer-by had thought to call an ambulance.

Lastly, it is, of course, true, that there is a higher proportion of emotionally unbalanced people in towns than elsewhere; for it is to the towns that not only the successes but the failures gravitate. A few are running away from practical difficulties, some from their families, and some just from themselves. Perhaps most fall into the two latter categories, and these, together with the merely shy and reticent or timid, form the bulk of the lonely. They are literally starving for companionship in the midst of plenty.

(5) **Boredom in Modern Life.**—If there are many lonely people in the modern city, there are others who are suffering from problems which may be classified under the head of "boredom." Indeed, this group may be much larger than the other. Some, surrounded by large families in small flats, will be saying to themselves: "Loneliness? I just wish I had a bit more of it. Why, I can't have even a moment's privacy!" Such people, even if they have some hobby or interest, have neither the space, peace, nor freedom from interruption to practise it. Then there are those with jobs which are either dull in themselves or associated with such emotional tension or resentment in their place of work that they have little inclination to interest themselves in anything else when they get home. Here again the question of stimulation by mass media comes in; for modern man cannot, like his country forebears, do nothing in his hours of leisure or amuse himself in conversation with his family. He feels he must always be "doing something." He must constantly be under some sort of stimulation, and when the radio or television is turned off he feels at a loss. Most often, unfortunately, he is not doing things—he is having things done to him; for his amusements increasingly tend to be passive. Of this type of man the saying of a great French writer, Blaise Pascal, is relevant: "I have discovered that all the unhappiness of men arises from one single fact, that they cannot stay quietly in their own chamber; men only seek conversation and entertaining games because they cannot remain with pleasure at home." Hence those great preservers of the state of matrimony, the pub, the radio, work, and football. Thus there is the man who can boast that he has "never said a cross word to his family," for the very good reason that he never has a chance to—the radio is turned on from the moment he gets back from work until the moment he goes to bed, and nobody is able to talk. This is equally true of the manager who "always has to work late" or of his employee, who, having eaten his supper, rushes off immediately to the local. Family life presents few difficulties, since it does not exist—at least for the husband. There are therefore two problems involved here: (1) the problem of education for leisure and how to use it to the best possible advantage; (2) the problem of supplying adequate accommodation, time and other facilities to allow those with the interest or ability to make the best use of their leisure.

There is nothing priggish in suggesting that one should make the best use of one's leisure. Nor is there anything wrong in going to pubs or football matches. But there is something undeveloped and childish about anyone who spends all his spare time in pubs, or in talking about or watching football. He is just like the man who listens uncritically to the radio: talks, music, variety are all the same to him so long as there is a background noise. If a hobby is to be anything better than a means of drugging the mind and preventing thought it has to be chosen and tested—not an activity which just happens to be ready to hand, but one which has been selected.

How much pleasure and talent is wasted can be seen any day in a hospital, where, when left with nothing to do, many patients find for the first time the happiness they can get from books, painting, or modelling. In order to avoid boredom one has to plan one's leisure as well as more serious activities. You will find some hints on the use of leisure, Q11.

Conclusions.—So far, then, we have tried to point out the main problems of modern life, and since the main pattern of the new way of living cannot be altered, we have seen that, to some extent, we must adapt ourselves to it. (This does *not* mean that adaptation is the one and only solution—in fact, many psychologists have overdone this theme—but it does mean that, living as most of us do, we can't pretend we are living on a desert island.) We have seen, too, that we can respond to the difficulties of modern life in three mistaken ways: by not knowing how to handle them (ignorance); by being faced with practical problems which arise from our surroundings but remain problems even when we understand what they are (environmental); and, lastly, and perhaps most uncomfortable of all, by having the sort of attitude to life which causes us to create our own problems (psychological). Let us deal with these sources of trouble one at a time.

IGNORANCE.

I said above that one of the main difficulties facing us today is the question of knowing what is true and what is not. We are being told so many things, and our heads are stuffed with so much information—much of it contradictory—that we really are in a much more unsatisfactory situation than more primitive people, who, even if they are wrong, can feel that they know what is what. When I first played golf one used to be given a small booklet which told one the rules of the club—what you could or couldn't do from the moment you entered the clubhouse. The booklet said nothing at all about the rules of golf, which you were supposed to know anyhow, but said only how you were expected to behave. But today we are often in the position of being on the course not only without knowing the rules of the club but without even knowing the rules of the game. The papers we read or the radio programmes we listen to are full of snippets of

information which taken together are more puzzling than informative: cigarettes are dangerous, cigarettes are not; milk is good for you, milk after forty makes you more liable to heart attacks; radio-active fall-out from bomb explosions is dangerous to the future of mankind, radio-active fall-out is practically harmless; fat people are jolly, fat people are likely to have shorter lives. So we don't know the rules of the game (and we can have a pretty shrewd suspicion that the experts don't always know either). But worse than this, we don't even know the club rules—that is, how to behave to other people; we know what our parent's attitude would have been about a teenage son or daughter having boy- or girl-friends, what our parents thought about telling the "facts of life," about "getting on," about colour or race problems in their personal aspects, about going to church and so on. But we know only that opinions have changed and ask ourselves whether we should change with them or not. Here is the most general problem about ignorance, and the first thing to understand is that for a new way of life one needs a new approach—an approach which does not reject new information, but is critical about it, which does not wholly believe but does not utterly disbelieve—in short, an approach which is logical, slightly cynical, and prepared on some subjects to keep an open mind. For example, it is highly improbable that the cough-mixture you hear about in advertisements is superior to the one supplied by your doctor (if he is a good doctor). You should, therefore, *prefer* your doctor's advice and prescription without being uncritical about either.

So, first, about the things that matter, you should choose the advice of someone you can trust and act on it. If you are dissatisfied, say so. Second, about the things that don't matter, you should keep an open mind. Thus, all the medical advice about smoking, milk, being fat, and so on, in my opinion is irrelevant to those who are healthy; for, if you took every precaution to live longer you would never do anything at all. Of course, if you have not yet started to smoke, it is better not to begin, and if your doctor advises you to, it is better to stop. Otherwise, why bother? Nothing good ever came from those who are always taking care. On the other hand, the hydrogen bomb is not just a medical problem but a moral one which concerns not only our own lives but those of other people. This is not one of the problems which do not matter, and since it concerns everyone, it should be thought out seriously by all responsible individuals, whatever conclusion their thoughts may lead them to.

So far as behaviour is concerned, we have to realise the hard fact that, although there are fundamental rules of behaviour, the more superficial ones are changing all the time. So you cannot apply the rules your parents applied to you directly to your own children. All one can say is that if you have brought up your children sincerely and with a genuine concern for their own interest (which is easier said than done), then you need have no reason to worry for them later. But to start worrying about them when they are in their 'teens is to start worrying too late. In another part of the section we shall have something to say about this matter.

Most problems, then, have their logical, moral, and personal aspects, all of which must be taken into account in making a decision. Here are some examples of the sort of things that bother people:

(1) **Unnecessary Fears** can be about anything, but are most often about medical, legal, or financial matters, and when I say "unnecessary," I do not mean that they are not real (although, of course, some are not). All that is meant is that, assuming them to be real, then either something can be done about them or it cannot. In the first case we have to do what is necessary, in the second case worry is useless.

When such fears exist it is essential to let nothing stand in the way of getting expert advice. Thus if you think you have cancer or any other disease go at once to a doctor—for you will feel pretty silly if, after months of worrying, you find there is nothing wrong, and if something *is* wrong, the sooner you have it dealt with the better. A disease won't go away just because you shut your eyes to it. If you think, as often happens, that what you have to disclose is embarrassing or shameful, go just the same; doctors, lawyers, psychologists, or any other experts used to dealing with these problems are quite unshockable, and the different forms taken by human wickedness or stupidity are small in number. Thus, in one of my less tolerant moods I am not morally upset because a patient is beating about the bush trying to tell me that he has (or thinks he has) venereal disease, or that she is (or thinks she is) an unmarried mother—I am simply bored that he, or she, will not get to the point when: (*a*) I have seen half a dozen similar cases on the same day, and (*b*) it is perfectly clear what they are going to say before they even begin. The expert is there to supply the information—that is what he is paid for—and your morals are not the slightest concern of his except in so far as they are going to influence his advice. A lawyer is there, too, to give advice, and if you really think that your misdeeds or marital quarrels or financial mistakes are surprising to him you are utterly mistaken. (*See* Q10 for the names of some organisations which may help you.)

Once you have got the advice, what you do will be influenced by your moral, religious, or other personal views. Thus, whether an unmarried mother decides to get married, keep the child, have it adopted, send it to a home, or (if she is physically unfit) agrees to have her pregnancy terminated will depend on her religious and moral views, and in the light of these she can discuss what to do with the doctor. Similarly, in a legal matter concerned with money the client has to consider both what, legally, he *has* to do and what morally he feels he *should* do.

Irrational fears differ from unnecessary fears in that they do not even appear to be sensible. Fears of open spaces, of leaving the house and walking outdoors, of being shut up in a small space (for example, in a railway carriage), of animals, of dirt or sharp objects are perhaps natural enough in their way. They are abnormal to the extent that they trouble you and keep you from leading a normal life; thus, it is reasonable to dislike dirt, but it is not reasonable to do so to such an extent that you have to wash your hands every five minutes. These are what a psychologist would describe as "phobias," and all that need be said about them is that nearly everyone has some phobia, and whether it requires to be dealt with by a doctor depends, as has already been said, upon how much it upsets you. You don't need to trouble about an irrational fear of heights unless you frequently have to be in high positions. Phobias are uncomfortable, but have no serious significance; they never lead to insanity.

(2) **Unnecessary Frustration.**—In talking about happiness, I mentioned the importance of having an aim in life. Now, just as with the problem of knowing what or who to believe, you have to be prepared to compromise about goals. We saw that, in matters of belief, it is necessary to make a delicate compromise between believing everything and believing nothing, and in the same way where goals are concerned you must compromise between what you want and what you reasonably can expect to have. If, for example, you are unhappy at your place of work the one thing *not* to do is just carry on and grumble, since this hurts nobody but yourself. You must either put up with what you have or pull up your roots and go elsewhere. But before you do either be careful to consider whether it is the job or yourself that is to blame—would you really be happier elsewhere? As already suggested, you can get a pretty fair idea of the answer to this by your previous experience—if you have always been somewhat of a misfit it would be better to see a psychologist than to go through the futility of getting another job no better than the one before.

Of course, it is only fair to say that many great men and women were profound misfits throughout a large part of their lives. Bernard Shaw produced little of value until he was nearly

forty, and Elizabeth Barrett Browning suffered from an entirely imaginary illness until she met Robert Browning at the age of thirty-nine. But, since few of us are geniuses, there is little use in departing from the general rule that the more "unsatisfactory" jobs you have had, the more it is likely to be something wrong with you rather than with the job. It is all very well to be idealistic, but it is merely silly to have ideals beyond your ability to achieve, or to blame your difficulties on "the system" or another person, because—and this is an obvious fact very few people seem to realise—in the real world it doesn't matter in the least who is to blame, all that matters is whether within your limitations you succeed or not. Telling others that you might have been the Lord High Everything Else had it not been for "the system" or your father, *whether or not it is true*, makes you only one thing—a bore.

What I have said about jobs applies equally to that very much overdone passion, romantic love. What matters in your choice of a mate is whether or not you can get on together, and romantic love is certainly no guarantee of this. In fact, there is good reason to believe that Bernard Shaw was not far wrong when he said that there would be just as many happy marriages if each of us married the first person he met on walking out of his house. But, whether you believe this or not, there can be little doubt that more "disappointments in love" are due to hurt pride than to genuine care for the loved one. For, if you really care for someone, you are concerned about their interests rather than your own, and by taking the attitude: "I want, I want . . ." you are telling more about your love for yourself than for the other person. A much more sensible attitude would be that of the seventeenth-century poet Sir John Suckling, who, finding himself in just this state of self-pity over the woman he had lost, wrote:

> "If of herself she will not love,
> Nothing can make her.
> The devil take her!"

The moral is: don't have ideals beyond your ability to achieve, since if you do, the only person to be sorry will be yourself. Try your best, by all means, but be realistic

(3) **Unnecessary Loneliness.**—This, on the face of it, appears to be mainly an environmental problem, and we have spent some time in discussing just why town life has made it increasingly a problem. Nevertheless, the personal side is just as important; for, although the normal person may feel at sea for a few weeks or so when he first arrives in a new area, he sooner or later finds his roots and makes friends. After all, even the most "unfriendly" town is full of churches, youth clubs, hobby clubs, and all sorts of institutes where the stranger would be welcome. My own experience is that most people are lonely because they are shy or timid, which is really just another way of saying that they don't like themselves. But behind this timidity there lurks a good deal of conceit, and the real attitude behind the embarrassment of a shy person entering the company of others is, "What are they going to think of me?" To which, fortunately or otherwise, the most common answer would be: "Nothing at all." If you really believe that you are the ugliest or the spottiest or the most peculiar-looking man or woman in the company, if you really suppose that you are more stupid or dull than the rest, what is this but colossal conceit? The fact is that you are much too anxious to create an impression, whereas the normal attitude should be, "I am what I am—take me or leave me."

And indeed you are what you are, so what is to be gained by pretending otherwise? Even if you are able to deceive your new-found company into thinking that you are knowledgeable about something you really know little about, you have gained nothing—on the contrary, you put yourself in the difficult position of maintaining a lie every time you meet them. So you had better assess your abilities more accurately or else find some real ones, although in reality the longer you live, the more you will find that few people are liked because of their abilities (more often they are resented because of them!), and liking and disliking are completely irrational processes. More people are liked in spite of their virtues than because of them.

So far as making friendships is concerned, the great advantages are not beauty, good looks, charm, or knowledge, but tolerance, being genuinely fond of others, and being able to forget yourself. (*See* C30–31 and Q11–12 for the names of various societies.)

ENVIRONMENTAL PROBLEMS.

Difference between Problems of Environment and of Psychology.—We have already seen that the difference between environmental and psychological problems lies in the fact that in the first case the person's surroundings or circumstances really are difficult; whereas in the second we can see that he has largely created the problems for himself by the way he looks at, or interprets, his surroundings, and, of course, by the way he responds to them.

No Problem is Entirely Environmental.—Although the distinction we have made is a useful one, no problem is entirely environmental, for the result always depends upon how the individual sees his situation, and what he does about it. It is "natural" to be unhappy in prison, but some people have been happy there; it is "natural" to be unhappy when one suffers from incurable disease, but, in fact, a large number of people with incurable disease find happiness and more peace of mind than those who are not sick. No, strictly speaking, there are no purely environmental problems—all your troubles are confined in a small area—your head. However, it is useful to make the distinction for practical reasons, for if you are trying to help an unhappy person, the first practical question to ask is: "Can I help him, or her, by getting him a new job, a new home, or new friends, or would he be miserable almost anywhere?" Of course, many people in trouble want to believe it is all the fault of others, of circumstances, of fate (in fact, the more it is their own fault, the more they like to believe otherwise). Some women, for example, assert that all their problems are due to the kind of house they live in, and five or six houses later they are still miserable. Some men are never able to find a "good" job, even after trying dozens. There are men and women who are always complaining of ill-health, but who would be desolate if some doctor were cruel enough to remove their only hobby—their real or imaginary illness and their absorbing interest in it. Although we may agree that all troubles are in the mind, it is necessary to distinguish between those that can be cured by a change of surroundings and those which require a change of oneself. The two overlap quite considerably. So, under the heading of "environmental problems," I am going to discuss such everyday matters as bringing up children, marriage, the problems of old people, and some general rules for leading a happy and useful life. You will have to decide for yourself where your own problem lies: are you an ordinary person in unhappy circumstances, or an unhappy person in ordinary circumstances? If you are seriously troubled, it would be a good idea to go to one of the bodies listed at the end of this section. Misery is not conducive to clear thinking, and it is always advisable to get the advice of others, particularly when they are experts in such problems.

Childhood.—Psychologists believe (and most sensible people have known for centuries) that the really significant time in life from the point of view of character building is the first five years. That is why it is so important for a child to have a proper start, as reflected in its early training. Some parents fuss and worry over their children in the late teens, when the fact is that if a child is not able to look after itself by that age, the parents must have made a sorry mess of their job

Detailed rules cannot be given about a subject such as this. It would almost be true to say: "It's not *what* you do—*it's the way that you do it.*" The only fundamental rule—and, of course, I am talking here about the child's character, not its bodily health—is complete, unconditional, and unpossessive love on the part of the parent. If you cannot give this, then all the rules in textbooks are of no avail.

The Spoilt Child and the Neglected Child.—The job of a father and mother, then, is to look after the child when it is unable to look after itself and bit by bit to give it as much freedom as it is fit to take.

When the first rule is ignored and the child is not looked after or is regarded as a nuisance we speak of a neglected child; when the second rule is ignored and there is no freedom we speak of a spoilt child. Both types are unfortunate, because the first grows up to regard itself as unlovable and the world as a hostile place, and the second grows up always depending on others and unable to make its own decisions. In neither case has wealth or social position much to do with whether a child is spoilt or neglected, and the popular notion that the spoilt individual usually comes from a wealthy home, the neglected one from a poor home is quite absurd. (As a matter of fact, if one were foolish enough to make a generalisation, it would probably be the reverse of the popular belief; for life in a public school is far tougher than in a council school, and the family atmosphere of the traditional upper class is ordinarily a good deal less demonstrably affectionate than in the working class.) It makes not the slightest difference to a child whether it is neglected because its mother goes out to work or because it is brought up by a "nanny" and its mother is always abroad or attending social events.

Possessiveness and spoiling are usually due to anxiety on the part of the parent—sometimes the mother who has lost her husband or is separated from him lavishes all her affection on her son and, not unnaturally, wants to hold on to him, sometimes the child is made a pawn in the conflict between husband and wife, and in yet another type of case the parent who has felt neglected in childhood tries to ensure that the same will not happen to her own family. But in each case the result is the same: the development of a suffocating, possessive, and unhealthy love. This is much less likely to happen in a large family, since the children are less dependent on their parents and more on each other. They have their edges rubbed off by having to learn to give and take; that is why, in the case of a single child or of a small family, it is a good idea to make use of a kindergarten or arrange associations with the children next door.

Children Learn by What You Do—Many parents have the pathetic belief that their disagreements pass unnoticed within the family. Unfortunately, they don't. Children, like other people who live more at the emotional than the intellectual level, know very well what is going on, and if there is some sort of conflict between father and mother they cannot but suffer thereby. How little some ostensibly affectionate parents really care can be seen by the numerous cases one reads of in the papers in which, following a divorce, the child is torn between one and the other quite regardless of its real interests.

No, like all sensible people, children are much more impressed by what you do than by what you say. Thus, if I find that Mr. Smith, who is allegedly too sick to do his quite light job, is able to work really hard in his own garden, then I don't believe Mr. Smith whatever he says. Similarly, a young boy I once knew who was crippled with infantile paralysis bitterly hated his mother, who, although poor, had spent much of her money on cures—some genuinely scientific, others carried out by quacks. He hated her because he knew that the real reason for her behaviour was that she was ashamed of his being a cripple, and he was quite right. The reason I know, too, is that she was my patient and she told me. Another mother was unhappy with her first husband and divorced him; they had one child, who, during the time of her unhappiness, was spoilt. She then married again, and, for reasons which seemed perfectly good to herself, sent the boy to a boarding school (the main reasons were that she had only a small flat, that her second husband wanted to be alone with her, and that she was getting somewhat scared of the amount of affection and possessiveness she had stirred up in her son). Now, in his twenties, the son is resentful of his mother, and although gifted, he finds it impossible to achieve anything; all he thinks about is having been "let down."

These are not unusual cases—on the contrary they are the material of everyday life, and to the statement that children have a pretty shrewd idea of what is going on we must add that what seems to a child to be a betrayal remains a betrayal no matter how good the *logical* reasons for it may appear to its parents. Children don't think—they feel.

Unconditional Love and Consistency.—Two things are necessary in order to rear happy children: unconditional love and consistency. Unconditional love means that, whether the child does right or wrong, it can feel that the parent's love is always there, that however much one dislikes the deed, one never ceases to love the child. Consistency means that there should not be too many rules, but the rules, once made, should in all circumstances be maintained. If you make too many rules, the child will lack character, since it is never free to choose and make its own mistakes; if there are too few, the child feels insecure because it never knows "what's what." In short, children should be as free as they are fit to be at any given age. The whole aim of a good upbringing is not that the father and mother should try to coerce their offspring according to their own parental ideals, but rather that father and mother should protect the children while they are growing into their true selves. After all, few people are such big successes in life that they are entitled to force their children into their own mould.

Mental Cruelty.—Most people in this country are, quite rightly, sensitive to the problem of cruelty to children—that is to say, obvious physical cruelty. But I doubt whether they are equally sensitive to the problem of mental cruelty. Take the example of the little girl or boy of three or four years old who is allowed to feel neglected upon the arrival of a new baby. Previously he has been in the centre of the picture, yet now he is suddenly left out of it, and assuredly his future happiness will not be helped thereby. Or the mother who would be shocked by the idea of hitting her child, but punishes it by saying: "Mother doesn't love you any more." "All right, go away, *we* don't care." Or the mother who said that she could always bring her little boy to heel by taking away his best-loved toy when he misbehaved. Or the mother who is always taking her child to a doctor at every slight ache or pain, and in front of the child tells the doctor: "Oh, doctor, I'm so afraid; his father had pains just like that and had to have a serious operation. He's never been the same since." Is this boy likely to grow up feeling a sense of security and having the courage to face life? What do children feel when the two people upon whom their whole security depends quarrel violently in front of them, or when they are always being left under the care of others while the parents go out? No, cruelty is not always physical, and I would even go so far as to say that the most devastating type of cruelty in its effect upon the child is the type of mental cruelty we have just been describing.

Child Guidance Clinics.—The infant is primitive, born without morals and only gradually comes to share the grown-up's views on sex, cleanliness,

and affection. If you get worried at such things as dirtiness or absence of shame you are revealing more about your own lack of emotional balance than about the child's naughtiness. There is a famous, and very true, saying, "There are no problem children, only problem parents," so if your child is a problem, ask first what mistakes you have made and remember that all psychological difficulties in childhood are due to lack of emotional security. When you notice such signs, take the child to a doctor and ask him to arrange an appointment at the local Child Guidance Clinic. Fortunately, the problems of children are much more easily dealt with than those of adult life. Danger signals which indicate that something should be done are: when the child is more noisy, aggressive, or destructive than the ordinary child; when it is too silent and unwilling to associate with other children; thumbsucking; bedwetting; nightmares or crying or screaming at night; frequent complaints of pain or sickness when your family doctor can find nothing organically wrong. Remember, the Child Guidance Clinics are there for the purpose of helping you, so there is no need to be hesitant in asking for their aid.

Marriage.—Most people nowadays seem to suppose that the only basis of a happy marriage is romantic love. Till fairly recent times marriage was as much to do with parents as with the bride and bridegroom and was regarded as a career for the woman—a career to be carefully prepared for by sex-instruction, and a training in cookery, child-management, and the running of a house. Today many girls rush into marriage from their work in a factory or office knowing considerably less about running a home, mending, or cooking than the man they marry, who may have been looking after himself for some years. Both men and women frequently share the most childish "romantic" notions, perhaps based upon the films they have seen. They seem to suppose that pleasure, rather than happiness, is the aim of life; that romantic love must last for ever; that marriage is the goal of life (whereas it is only the beginning of learning to adapt to a new way of life); that children are nice but a nuisance; that one's wife, or husband, should remain beautiful or handsome. And, of course, when one is disappointed, there is the final delusion: that divorce is always a solution.

Some General Points about Marriage.—Reading about problems is useful because it can show what is wrong and can give some degree of understanding. But full understanding comes only from experience and personal contact with others. So the points I want to make about marriage must be made quite briefly: First, many of the difficulties experienced by husband and wife are related to social problems peculiar to our times. Second, frustration is *in terms of what one expects and does not get*, not at all in terms of objective reality. In other words, if you expect too much, or if you expect different things from what you are going to get, you are bound to be disappointed no matter how "lucky" you appear to other people. It is not always life or "fate" that is to blame for human misery; very often it is the way the individual looks at life and his unrealistic demands upon it that cause the trouble. This point is so important, and so little understood, that it is worth while saying something more about it. When one says that every personal problem is also a social problem, what is meant is that the kind of problem we have to face is partly created by the society in which we live. It does not mean that we are the helpless playthings of fate; for the way in which we deal with the problems is very largely our own responsibility.

Divorce is sometimes the only solution to a marriage which has failed, but there are two dangerous things about divorce which should be taken into consideration. First, the fact that divorce is possible makes people think of it as the obvious answer when trouble arises instead of trying to do something when a marriage could still be saved. Second, just because failure in marriage is always due to the personal defects of both people, unless these defects are remedied the second marriages will be no better than the first.

Steps to Happy Marriage.—I could have occupied some space in this section telling you about the sort of behaviour which leads to a happy marriage: a spirit of give and take, tolerance, and so on. But, unfortunately, people either have these qualities or they do not, and you certainly cannot obtain them by reading about them. So, if your marriage is in serious difficulties, the proper thing to do is to go to a Marriage Guidance Clinic for help. However, here are some aspects which you can do something about, and most doctors and psychologists would agree with the following points:—

(1) Before marriage a woman should learn something about running a house, cooking, and bringing up children.

(2) Reflect upon the meaning of love. Although "love" is a word which is often talked about rather glibly, it can have a number of different meanings. *Romantic love* is based upon sentiment (often upon sentimentality), and its essential feature is an idealisation of the other person, so that one all too often sees in the beloved qualities which are not there. That may be a good thing, but it is certainly no guarantee in itself of a happy marriage, as the divorce courts make it painfully clear. Reflect carefully upon the nature of *possessive love*, based upon a desire to possess the other person regardless of his or her own best interests. One thinks here of the mother or father who unwittingly prevents children who have grown up from leading their own lives, or of the jealous wife or husband who will not let his or her partner in marriage go out or meet other people. Possessive love is not really love at all. True love is based upon mutual respect and a deep desire to further the other person's best interests whatever sacrifice one has to make oneself.

(3) Keep your good appearance. Both husband and wife should keep up appearances after marriage just as they did before; they should not lose their good manners, or dress carelessly, with the implied attitude that it no longer matters what the other partner thinks. In this sense marriage should be an eternal courtship in which one always goes on trying to please the other. True, this will not save a basically impossible situation, but lack of the observance of this rule may break up a marriage which well might have been saved.

(4) Lastly, two observations about children. First, a couple should never have a child with the sole intention of trying to prevent a marriage from going on the rocks. It is unfair to the child, and if a marriage is in such a bad way, having a child is unlikely to have the desired effect. Second (and this may be an unpopular statement), *every child needs the full care of its mother in the first five years of its life.* One of the reasons for the increase in juvenile delinquency in recent years is the failure of mothers to give the child full attention. The family has been called "the character factory of society," and character is formed in the first five years of life; without the mother the factory cannot work properly.

Sex.—It is often said that more marriages break down because of sexual difficulties than for any other single reason. As it stands, this statement is not true. Sexual difficulties come into two categories: those due purely to ignorance, and those basically due to *personality* problems between the two partners. The first kind are a straightforward medical matter, which can be solved by a family doctor, by a Marriage Guidance Clinic, or even by reading a good book on sex technique. The other kind are an entirely different matter: for here the sexual difficulty does not cause the trouble in the everyday relationship between husband and wife, but their unsatisfactory everyday relationship causes the sexual difficulty. For example, if the wife suspects

infidelity on the part of her husband, if she has had an unhappy home life with her parents which leads her to suspect men or fear sex or marriage, if she is afraid of having more children, or if she feels a latent resentment towards her husband over some matter quite unrelated to sex, these feelings may make her sexually frigid. With women, as contrasted with men, sexual happiness is impossible unless the total personal relationship between the partners is satisfactory. A list of books about sex is given on a later page, but where the problem lies in the sphere of personal relationships the help of a psychiatrist or the Marriage Guidance Clinic must be sought. We must, therefore, reverse the statement that sexual difficulties (except those due to ignorance) cause marriage difficulties; the truth is that difficulties in the everyday relationships between the partners cause sex difficulties.

Old People.—We live in a society which has the highest proportion of old people anywhere in the world, and the proportion will go on increasing. Old age is, of course, associated with a decline in physical and mental powers, but social and medical factors may hasten or slow down this decline. For example, the person who has led an active life often rapidly deteriorates when he has to retire or when he lives by himself and is thus cut off from human society; he loses interest, becomes untidy, and does not look after himself properly. He has, in fact, nothing to live for and shows it in his behaviour. In cases like this there is often a dramatic improvement when the old person goes to a Residential Home where he gets proper food and, above all, company and things to do. *A great deal of the appearance of deterioration in old age has to do, not with physical, but psychological factors:* lack of a goal, a feeling of being unwanted, loneliness, and all the things we have already seen to be so important for psychological health and happiness at all ages. The grumpiness, the interfering, the selfishness often associated with old age are largely due to circumstances rather than natural "cussedness"; they are the reactions of anyone who feels unwanted or useless, and many of the so-called problems of the aged would be removed if they were allowed to continue work under suitable conditions. The aged may be cared for:

(1) in their own home, living alone;
(2) in the home of their children or relatives;
(3) in an Old People's Residential Home;
(4) in the Geriatric Unit (for the sick and aged) of a Hospital.

Welfare of Old People.—In 1940 the National Council of Social Service sponsored the formation of the National Old People's Welfare Committee, which now co-ordinates the activities of voluntary organisations, seeks to bring about improvements in legislation, and, in general, studies the needs of the old. Some of the services provided by various bodies, information about which may be obtained from the secretary of the local Old People's Welfare Committee, are: Home Nursing Service, Health Visitor Service, Home Helps, Night Attendance, Physiotherapy, Chiropody, Meals Service (meals brought to the home or arranged in nearby centres or restaurants), extra foods, baths, free laundry service, mending service, coals and logs, and holiday schemes.

Attitude to the Old.—*Where* the aged are cared for depends primarily upon medical factors, which should be discussed with the family doctor. Obviously, a sick person cannot stay by himself at home, but, on the other hand, a healthy person cannot be sent to the Geriatric unit of a hospital. One must think of the other members of the family, and here the moral problems begin: should one look after one's aged relatives even if they are troublesome and a wholetime problem, or should there be a limit set to one's responsibilities in this respect? The answer must be personal, and one suggestion is that the old (and, in particular, our parents) are entitled to expect some attention from their children. But, on the other hand, nobody is entitled to expect another person to give up his whole life to this end. A parent is fully entitled to expect from son or daughter as much as the parent has done for them, and a parent will accept what son or daughter willingly chooses to do. But a parent must not demand the sacrifice of marriage, career, or happiness. If an unmarried daughter genuinely wishes to look after her father or mother, giving up all hope of any other career, she may, of course, do so; but to give up her whole life *unwillingly* to this end is not being self-sacrificing, but wrong. We have a duty to others, and particularly to our parents; but we also have a duty to ourselves. Such problems should be solved by considering the best interests of all those involved—the greatest happiness of the greatest number—and the younger the individuals concerned, the more consideration they are entitled to. One should help one's parents or parents-in-law, even at considerable sacrifice, but not to the extent of sacrificing the whole of one's life, the happiness of one's marriage or children.

The Sacred Rule of Non-interference.—No situation is more liable to cause trouble than the interference of one generation in the affairs of another. In particular, the older generation should never give unasked advice to the younger—especially concerning the upbringing of grandchildren. If your children are not capable of reasonable behaviour once they are adults, they are certainly not likely to be changed by unwanted advice. Nor should parents interfere in the quarrels of their married children; if any interference is called for, it should come from those who are less emotionally involved.

PSYCHOLOGICAL PROBLEMS.

We have seen that a psychological problem is one which is caused less by your surroundings than by the way you look at them. You should suspect that your problems are primarily psychological: (1) if the same situation in life keeps cropping up—love affairs always ending unhappily, jobs always being lost or given up, and so on; (2) if you have difficulty in getting on with your fellows; (3) if you are depressed, anxious, or unhappy without obvious reason; (4) if you have nervous symptoms, *e.g.*, irrational fears (of closed spaces, open spaces, or disease), sudden attacks of panic or anxiety, or pains for which the doctor can find no adequate explanation. These conditions, whether they masquerade as personal problems or as "nerves," have this in common; they are caused by a faulty attitude to life, and, in particular, to other people, originating in early training. *"Nerves," neurosis, and psychological problems in general are not diseases in the ordinary sense, and are always caused by fundamental misunderstandings in the sphere of human relationships.*

Many people have troubles of this sort, and doctors say that 60–70 per cent. of all their patients come into the category of people who are suffering from the "bad" emotions of hate, anger, resentment, fear, and anxiety—people who are ruining their own lives because of the past. Some of them create their own problems in everyday life, others suffer from "nerves," and yet others develop those physical illnesses due to prolonged worry and emotional stress: stomach ulcer, "fibrositis," high blood-pressure, heart trouble of certain types, headaches, some kinds of skin disease, and so on.

Most of us have such problems from time to time, and sooner or later they pass, but when such problems are persistent it is necessary to consult a psychiatrist. True, in most cases such states are not dangerous—men and women with "nerves" do not (as so many of them fear) go insane. But they suffer a lot of needless misery. If you are suffering from any of the problems mentioned above it would be a good idea to ask for expert advice at one of the bodies mentioned on the next page.

WHERE TO OBTAIN HELP ON PERSONAL PROBLEMS AND ON MARRIAGE AND HOME PROBLEMS.

The following are some of the principal organisations:—

Marriage Guidance Councils.—The National Marriage Guidance Council, 58 Queen Anne Street, Grosvenor Square, London, W.1 (MAYfair 2731/2) co-ordinates nearly 100 Marriage Guidance Councils in England, Wales, Northern Ireland and the Channel Isles. This headquarters will gladly give the address of any of the local Councils. Similarly the Scottish Marriage Guidance Council, 44 Queen Street, Edinburgh 2 (Caledonian 5006) co-ordinates 8 Councils in Scotland.

The local Councils offer skilled, kindly, and confidential help to those who want it before marriage and after. Particular help is given to engaged couples on all aspects of marriage and parenthood. This is done by private consultation and by informal discussions for small groups of engaged couples, as well as by sound publications on wedding etiquette, budgeting, sex, and all aspects of marriage.

Marriage counsellors—men and women volunteers most carefully selected and trained—offer help to all who seek it in any marriage difficulty. This help is given to more than 12,000 couples a year through private consultations and when necessary help is available from doctors, psychiatrists, lawyers, spiritual advisers, and other social workers.

The National Council's Bookroom issues a free list of recommended books and pamphlets available on request to 58 Queen Anne Street, London, W.1. Books are despatched by post in plain wrappers. Some of these books and pamphlets are referred to in the list given in this section.

The National Association for Mental Health, 39 Queen Anne St., London, W.1 (WELbeck 1272).—This voluntary body provides an advisory service for individual cases. It can help you to understand your children's problems; or (if you are a teacher) it can help with courses about the development of children and their intellectual capacities. If you have the care of old people it can help you to make the best arrangement for their care; and if you have a backward child it can help you about schools and special centres. The Association also has Homes for mentally handicapped children and for elderly ladies suffering from mild mental deterioration, and two Hostels for educationally subnormal school leavers. If you have a personal problem the Association can put you in touch with good advisers. It will help you to find the nearest Psychiatric Out Patients Clinic or Child Guidance Clinic. You may want to help mentally handicapped people, and if so the Association can advise you about training and can offer courses to qualify you for work with mentally handicapped children.

There are 20 voluntary Mental Health and Mental Welfare Associations under the ægis of this National Association throughout the country.

Family Planning Association (1930), 64 Sloane St., S.W.1 (Belgravia 7575).—*Objects*: (*a*) To advocate and promote the provision of facilities for scientific contraception so that married people may space or limit their families, and thus promote their happiness in married life and mitigate the evils of ill-health and overcrowding. (*b*) To advocate and promote the establishment of Family Planning Centres, at which, in addition to advice on scientific contraception, advice and, where necessary, treatment are given for any or all of the following—(i) involuntarily sterility; (ii) difficulties connected with the marriage relationship. (*c*) To encourage the production of healthy children who are an asset to the nation, provided that their parents have the health and means to give them a reasonable chance in life. (*d*) To examine such other problems as are relevant to the above, and to take such action as may be considered advisable.

The F.P.A. has 313 clinics throughout the country, many on local authority and hospital premises, and a sub-fertility investigation unit, and postal advice department, and pregnancy diagnosis service at its Headquarters. The Association is supported by voluntary funds. At some clinics fees are related to family income, at others there is a moderate fixed charge. No one is refused advice because of inability to pay.

Family Welfare Association, Denison House, 296 Vauxhall Bridge Rd., London, S.W.1 (Victoria 7334/8). The National Assistance, National Insurance, and National Health Service Acts have assured to the citizen the satisfaction of many basic needs, but many people still require certain forms of personal service which the State does not provide. It is here that the Family Welfare Association has its place.

The Casework Service of the Association is carried out in local offices, of which a list can be obtained. Many family difficulties can be resolved by comparatively simple forms of help. In addition to providing a casework service, the Association, in its local offices, gives practical training to students in family casework.

In addition, the Association sponsors: (1) the Old People's Homes Committee, which gives advice on suitable Homes for elderly people and problems of old age; and, (2) the Citizens' Advice Bureaux Service, in Central London.

The Family Discussion Bureau, 2 Beaumont Street, London, W.1 (WELbeck 5415).—The Bureau is a professional Marriage Counselling Service under the ægis of the Tavistock Institute of Human Relations serving the Greater London Area. It is staffed by a group of caseworkers with the relevant qualifications and professional experience who work in co-operation with psychiatric Consultants from the Tavistock Clinic. Interviews, which last for an hour, are arranged at weekly intervals. The period of attendance varies widely, and may extend over a considerable period. Although it is considered more advantageous if the two partners make a joint effort, cases are accepted in which only one is willing to attend. Those wishing to consult the Bureau or to refer cases are asked to telephone or write.

Family Service Units, 25 St. Mary's Grove, London, N.1 (Canonbury 6662).—There are 4 Units in London and other Units in Liverpool, Sheffield, Leicester, York, Manchester, Birmingham, Bristol, Stockport, Oldham, and Bradford, as well as in parts of Lancashire, Derbyshire, Surrey, and Middlesex. For addresses apply to above address.) This organisation provides a voluntary specialised service for "problem families." For this purpose "problem families" does not mean any family in difficulties, but families where conditions have been such as to lead to neglect of children. Sometimes parents are disabled or suffering from chronic illnesses. For the families' own welfare and that of the community they need help. Family Service Units exist to meet this need.

The National Association for Maternity and Child Welfare, B.M.A. House, Tavistock Square, London, W.C.1.—Gives enquirers much useful advice on these matters.

Maternity and Child Welfare Centres.—The address of the nearest Centre can be obtained from your doctor, a hospital, or the local council offices. The Local Education Authority provides Nursery Schools for children between two and five.

Other Useful Addresses.

The National Adoption Society, 47a Manchester St., W.1.

The National Children Adoption Association, 71 Knightsbridge, S.W.1.

The Royal National Institute for the Blind, 224/6/8 Great Portland St., W.1.

The National Institute for the Deaf, 105 Gower St., W.C.1.

SOME USEFUL BOOKS AND PAMPHLETS.

For Married and Engaged Couples.

The Art of Marriage. Dr. Mary Macaulay (Delisle, 7*s.* 6*d.*).

Modern Marriage. Dr. Edward T. Griffith (Methuen, 10*s.* 6*d.*).

A Woman Doctor Looks at Love and Life. Dr. M. Hilliard (MacMillan, 10*s*. 6*d*.).
The Sexual Responsibility of Woman. Maxine Davis (Heinemann, 15*s*.).

SOME HINTS ON LEISURE AND DETAILS OF ORGANISATIONS.

General.—The opportunities for intellectual and artistic pursuits (bringing both companionship and recreation are very varied, but for some readers living in remote places these opportunities may need a little search. When found they will be all the more valuable. You can get details of lectures, discussion groups, or classes from the Local Education Authority, and if you don't know where to write or call ask at your town hall or local library, or Citizens' Advice Bureau, or Post Office. If you are in a university town write to the Extra Mural Department. These departments of universities produce a most attractive and diverse range of courses and week-end schools; and you may be sure that whatever your interests, there will be something specially attractive to you. If you live in the country ascertain the nearest place to which the County Library periodically brings books.

The W.E.A. is wholly concerned with education and is non-party politically and unsectarian. Branch members organise their own programme of studies in the form of classes, week-end and day schools, visits to places of interest, concerts, films, and conferences on issues of the day.

The Central Office is 27 Portman Square, London W.1; and the following are the addresses of the District Secretaries:

Eastern: 7 Hills Road, Cambridge. Area covered: Essex (part), Suffolk, Norfolk, Northamptonshire, Huntingdonshire, Cambridgeshire, Bedfordshire, Hertfordshire (most of).
Northern: 51 Grainger Street, Newcastle-on-Tyne, 1. Area covered: Durham, Northumberland, Cumberland, Westmorland.
South-eastern: Merton, Castle Hill, Rochester Kent. Area covered: Kent and East Sussex.
West Lancs and Cheshire: Room 28, Burton Chambers, 38/40 Church Street, Liverpool. Area covered: West Lancashire and part of Cheshire.
London: 28 Woburn Square, London, W.C.1 Area covered: London, Middlesex, Surrey Essex (part) and Hertfordshire (part).
East Midland: 16 Shakespeare Street, Nottingham. Area covered: Leicestershire, Rutland, Lincolnshire (part), Nottinghamshire (part) and Derbyshire (part).
West Midland: 19 Calthorpe Road, Birmingham. Area covered: Herefordshire, Shropshire, Warwickshire, Worcestershire and South Staffordshire.
Southern: 19 College Place, Southampton. Area covered: West Sussex, Hampshire, East Dorset and Isle of Wight.
Berks, Bucks, and Oxon: 42 Wellington Square, Oxford. Area covered: Berkshire, Buckinghamshire and Oxfordshire.
North Staffordshire: Cartwright House, Broad Street, Hanley, Stoke-on-Trent, Staffs. Area covered: North Staffordshire.
Western: 7 St. Nicholas Street, Bristol, 1. Area covered: Gloucestershire, Somersetshire, Wiltshire and West Dorset.
North-western: 423 Oxford Road, Manchester, 13. Area covered: Parts of Lancashire, Cheshire and Derbyshire.
South-western: 1 Portland Square, Plymouth. Area covered: Devon and Cornwall.
Yorkshire North: Blenheim Institute, Blackman Lane, Leeds, 2. Area covered: The whole of Yorkshire, except that part included in Yorkshire (South) District, and part of Lincolnshire.
Yorkshire South: Campo Chambers, 26 Campo Lane, Sheffield, 1. Area covered: Parts of Yorkshire, Derbyshire, Lincolnshire and Nottinghamshire (including Penistone South to Chesterfield, and East via Barnsley to Scunthorpe, Chesterfield East via Retford to Gainsborough, thence North to Scunthorpe).
North Wales: 33 College Road, Bangor, N. Wales. Area covered: Flintshire, Anglesey, Merioneth, Denbigh, Montgomery, Caernarvon.
South Wales: 49 Charles Street, Cardiff. Area covered: Monmouthshire, Glamorgan, Pembroke, Carmarthen, Brecknock, Cardigan and Radnor.
West of Scotland: 177 Hill Street, Charing Cross, Glasgow, C.3.
North of Scotland: 36 Albyn Place, Aberdeen.
South-east Scotland: 13 Abercrombie Place, Edinburgh, 3.
N. Ireland: 56 Dublin Road, Belfast, N.1.

The Townswomen's Guild.—The address of the National Union is 2 Cromwell Place, London, S.W.7. It comprises eighty-nine Federations in which there are 1,909 Guilds. The object of these Guilds is to encourage the education of women to enable them as citizens to make their best contribution to the common good; and to serve as a common meeting ground for women irrespective of creed and party, for their wider education, including social activities. Townswomen are thus interested in anything and everything which touches women's place as citizens. There are Guilds throughout Great Britain, and they meet monthly. Craft classes, Drama, Music, and Social Studies groups meet in the intervening weeks. Each Guild is self-governing.

The Women's Institutes.—Women of every age belong to Women's Institutes, and to each her membership means something different. Perhaps to the young girl a chance to act, to the bride cookery classes, to the mother a course on home management, to the older woman an opportunity for public service. But to all of them it means companionship, friendship, and an interest outside the home, beyond the family circle. Courses of classes or discussions are arranged, and many Institutes have their own choirs and drama groups. There are now well over 8,000 Institutes. The address of the National Federation is 39 Eccleston Street, London, S.W.1. Any Women's Institute member is eligible to apply to attend a course at Denman College near Abingdon, Berkshire, and these range from practical everday interests—cooking, dress-making, home management, craft work—to drama production, music, literature, art, and history.

Art Exhibitions, Art Films, and Entertainments.—You should enquire what possibility there is of seeing, near your home, one of the exhibitions produced by the Arts Council of Great Britain. There are major exhibitions of important works both historic and contemporary; and also quite modern exhibitions, sometimes of reproductions instead of original works, which can be shown in places where there is no public gallery. The Council circulates widely each autumn and winter a programme of films on art, in co-operation with the British Film Institute.

Enquiries may always be addressed to Arts Council Headquarters or to the Scottish or Welsh Offices:

Headquarters: 4 St. James's Square, London, S.W.1.
Scotland: 11 Rothesay Terrace, Edinburgh 3.
Wales: 29 Park Place, Cardiff.

Drama and Music.—There is a whole realm here of delight and enrichment and excellent bodies to help you. Particulars are given below of the Britsh Drama League and other bodies. Many libraries lend music records and sets of plays (for play reading).

The British Drama League, 9 Fitzroy Square, London, W.1, is the national voluntary body devoted to the art of the theatre. Its library contains 5,000 complete sets of plays available for reading and rehearsal. Staff tutors travel all over the country to give courses. Its Information and Advice Bureau assists societies in the running of plays. It has recently constituted the Junior Drama League to encourage young people in the art of the theatre.

There is a British Drama League in Australia, New Zealand, and Canada. The League in London runs a Full-time Course for students from overseas. For a modest subscription advantage can be taken of the Overseas Service whereby members get the League's magazine *Drama* and the right to personal advice by correspondence. The Study Box on Drama is widely used throughout the world, and has been the basis for the first steps in dramatic activity in several countries.

National Federation of Music Societies, 4 St. James's Square, London, S.W.1, assists music societies by information, advice, and in other ways. It publishes a catalogue with practical details of some 500 choral works.

National Operatic and Dramatic Association, 1 Crestfield Street, London, W.C.1, has a library of musical scores and dramatic works.

Workers' Music Association, 17 Bishops Bridge Road, London, W.2, aims to provide opportunities for developing musical instincts and tastes. It believes that genuine art has moved people to work for the betterment of society and will continue to do so. It organises classes, lectures, week-end and summer schools Correspondence courses can be taken in Harmony, Counterpoint, and Orchestration.

Folk Dancing

English Folk Dance and Song Society, 2 Regents Park Road, London, N.W.1.
Royal Scottish Country Dance Society, 12 Coates Crescent, Edinburgh, 3.
Welsh Folk Dance Society, Epworth, Abergele.

The Holiday with a Purpose.—At home there are the field centres of the Council for the Promotion of Field Studies (Ravensmead, Keston, Kent); and the great variety of schools for week-ends and summer schools for holidays (see especially the *Calendar of Residential Courses* published by the National Institute of Adult Education, 35 Queen Anne Street, London, W.1).

There is a wealth of information about holidays abroad with a purpose. A book published by UNESCO, called *Vacations Abroad*, lists 800 study tours, summer schools, and work camps in sixty-four countries. This costs 4*s*. 6*d*. from UNESCO Publications, H.M.S.O., P.O. Box 569, London, S.E.1. The United Nations Association (International Service), 25 Charles Street, London, W.1, also arranges works camps at home and abroad. The Central Bureau for Educational Visits and Exchanges, Hamilton House, Bidborough Street, London, W.C.1, also supplies details of work camps and vacation courses abroad. Remember also the Travel Department of the National Union of Students, 3 Endsleigh Street, London, W.C.1.

Mountaineering and Recreation.—The young person is better catered for than ever before. In recent years a number of organisations have been founded to encourage mountain climbing and to provide special "adventure courses."

The Mountaineering Association, 102A Westbourne Grove, London, W2, runs training schools for climbers at all stages in Britain and abroad; and also runs evening classes on rock climbing in conjunction with education authorities.

The White Hall Centre for Open Country Pursuits, Manchester Road, near Buxton, Derbyshire, holds courses by the Derbyshire Education Committee for those between thirteen and twenty plus on hillcraft, rock climbing, camping, ski-ing, and canoeing.

Outward Bound Trust, 123 Victoria Street, London, S.W.1, runs schools in Wales and the Lake District to train boys—with a few courses for girls—through sea, mountains, and other natural elements how to face hazards and hardships of all kinds.

The Central Council of Physical Recreation. Addresses are:

England: 6 Bedford Square, London, W.C.1.
S. Wales: 18 Windsor Place, Cardiff.
Northern Ireland: 45 Arthur Street, Belfast.
Scotland (Scottish Council): 4 Queensferry Street, Edinburgh 2.

The Man at Sea.—It is possible that this book will come into the hands of a seafarer in the British Merchant Navy or Fishing Fleets; and he will probably feel cut off from all the sources of intellectual pleasure we are describing. But he is not overlooked. The Seafarers' Education Service and College of the Sea described below are ready to satisfy his hunger for books, study, and hobbies.

The Seafarers' Education Service aims to provide a first-class library service to ships, and no charge is made for the loan of the books themselves. Through a department called the College of the Sea it also lends books to the serious reader personally, and gives tutorial help by correspondence courses in all general subjects to those who want it; and it helps with all hobbies. The address of the Head Office is 207 Balham High Road, London, S.W.17, and at Liverpool, the Library and Information Centre is at Corinthian Buildings, South Castle Street. There is surely no man afloat who does not appreciate the work of this Service, which has been working unobtrusively for thirty-five years.

II. BIRTHS, MARRIAGES AND DEATHS

BIRTHS: HOW TO REGISTER (ENGLAND AND WALES)

1. Notification of Birth to Medical Officer of Health.—Within 36 hours after the birth of a child, notice must be given to the district Medical Officer of Health by the father of the child, if he was residing on the premises where the birth took place, or by any person who was in attendance upon the mother at the time of the birth or within six hours afterwards. Generally this duty is discharged by the doctor or midwife attending the mother, but if the birth occurs at the home of the parents and the mother receives no medical atten-

tion, then the responsibility for notification rests upon the father of the child. This notification to the health authorities must not be confused with the registration of the birth, which is an entirely separate procedure.
